Mercury, Proto-Iodide	1-5, 1-4, 1-2 gr.
Morphia, Acetate	1-8, 1-4 gr.
Morphia, Sulphate	1-16, 1-10, 1-8, 1-6, 1-4 gr.
Morphia, Valerianate	1-8 gr.
Podophyllin	1-8, 1-4 gr.
Quinia	1-2, 1-4 gr.
Strychnia	1-60, 1-40, 1-30 gr.
Sulphur, Iodide	1-25, 1-10 gr.
Tartar Emetic	1-100, 1-20, 1-4 gr.
Zinc, Phosphide	1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

Quote MEDICAL RECORD.

SOLUBLE PILLS.

170 WILLIAM STREET, NEW YORK, October, 1876.

THE marked increase during the past few years in the demand for Pills made in accordance with the U. S. Pharmacopœia and other recognized formulas, has induced us to commence their manufacture in our own laboratory, and we are now furnishing Coated Pills, which, for beauty of finish, solubility, and general excellence, are unequaled.

The best substances are used in their manufacture. No article required by a formula is omitted on account of its high cost, nor are any pills deficient in weight; so that we can guarantee them to be made in strict accordance with the standard formulas, *both as regards the materials called for and in weight.*

The pills are coated while soft, and the excipients employed are such as preserve a mass readily soluble in the juices of the stomach, thus insuring prompt action.

The coating, which is soluble and so transparent as to clearly reveal the color of the mass, effectually covers any nauseous taste, and renders the pill easy to be swallowed. Its solubility can be readily tested by allowing a pill to rest upon the tongue for a few seconds.

Particular attention is called to our Granules of Morphine, Strychnine, Arsenious Acid, and other powerful remedies, which are prescribed in minute doses. The desirability of having these medicines in this shape, accurately weighed and ready for administering, has long been recognized. We have taken every precaution to insure accuracy in weight, and can give assurance that in this, as in other particulars, they can be implicitly relied upon.

We shall be happy to furnish any samples that may be desired.

NOTICE—See our Advertisement in alternate numbers of the RECORD.

W. H. Schieffelin & Co., 170 and 172 William St., New York.

ALOIN, { THE ACTIVE PRINCIPLE OF ALOES.

MANUFACTURED BY THE DISCOVERERS,

T. & H. SMITH & CO., Edinburgh and London.

"The uniformity in strength of Aloin, the smallness of its dose, and the certainty of its action should commend it to the favourable consideration of all medical practitioners."—*Vide* Dr. WM. CRAIE'S Investigations, published in *Edinburgh Medical Journal* for May, 1875.

Messrs. SMITH will send free by post a Sample of Aloin to any Medical Gentleman desiring it.

Original Lectures.

DISEASES OF THE NERVOUS SYSTEM.

A Lecture Delivered at Bellevue Hospital Medical College, December 14, 1877.

By C. E. BROWN-SÉQUARD, M.D.

(Reported for The Medical Record.)

SYMPTOMS OF DISEASE IN THE CONVOLUTIONS OF THE BRAIN—DO PSYCHO-MOTOR CENTRES EXIST IN THE CONVOLUTIONS?—ONE-HALF OF THE BRAIN REMOVED WITHOUT PRODUCING PARALYSIS UPON THE OPPOSITE SIDE OF THE BODY, BUT, ON THE CONTRARY, REMOVING THE PARALYSIS ALREADY PRESENT ON THE SAME SIDE OF THE BODY—PARALYSIS THE RESULT OF INHIBITORY ACTION—CLINICAL FACTS RELATING TO THE CONVOLUTIONS OF THE BRAIN—CONVULSIONS WITH DISEASE IN THE BRAIN—CURABILITY OF EPILEPSY DEPENDENT ON BRAIN DISEASE—THE AURA AND LOSS OF CONSCIOUSNESS—AN ATTACK OF EPILEPSY PRODUCED BY IRRITATING SOME PARTS OF THE SURFACE OF THE BODY—VARIETIES OF AURA—LOSS OF CONSCIOUSNESS.

Gentlemen:—I have endeavored in preceding lectures to show that, although symptoms of disease of the brain are exceedingly variable, we can generally arrive at a correct diagnosis regarding the seat of the disease in that organ.

The portions of the brain which remain to be examined are the convolutions. The convolutions of the brain, certainly, are parts which produce exceedingly variable symptoms; so that, if you have to deal with a case of paralysis dependent upon disease located in those parts, you may have great difficulty in reaching a diagnosis regarding the seat of the lesion. Still there are symptoms which may lead to correct diagnoses, but before speaking of them there is one point to which, although it has been mentioned many times during this course, I must again revert, and that is whether or not the convolutions of the brain contain what has been called psycho-motor centres.

DO THE CONVOLUTIONS OF THE BRAIN CONTAIN PSYCHO-MOTOR CENTRES?

As you well know, within the last five or six years great efforts have been made by physiologists, first in Germany, then in England, in France, and finally in this country, to establish the fact that certain parts of the convolutions of the brain in front and behind the fissure of Rolando, and also those near the fissure of Sylvius, are those in which the will-power acts to produce voluntary movements.

The facts upon which these views have been grounded are extremely interesting, and indeed one in particular, that discovered by Fritsch and Hitzig, is extremely remarkable. It has been believed by physiologists and by physicians that the brain substance, in the central lobes at least, was not excitable under the application of any ordinary irritation, such as galvanic, mechanical, chemical, or traumatic. As you well know, when heat or cold, or pressure or irritation of any kind is applied to a nerve, or to certain parts of the spinal cord, or the base of the brain, they produce what are called reflex movements, and direct movement if the part irritated is directly motor. There is no doubt that, if we found such movements to follow irritation of certain parts of the convolutions of the brain, it would be established that those parts were either excito-motor or directly motor. But it is not so. The only agent, thus far, which has been found to be able to produce movements when the surface of the brain is excited is galvanism. But galvanism produces a diffused effect, and its influence can be propagated to other parts, so that the movements which occur when the surface of the brain is excited at certain points do not show that those parts are psycho-motor centres. Again, the efforts which have been made to show that galvanism applied to the surface of the brain causes movements by irritation propagated to other parts, have shown that such propagation takes place irregularly, and is not constant.

There is no doubt at the present time, notwithstanding all the efforts of friends and pupils—efforts led in a measure by myself, although I was mistaken—there is no doubt that local irritation of the surface of the brain by galvanism may be followed by muscular movements, but there is nothing whatever which proves that those movements result from the fact that the part acted upon is a psycho-motor centre. We know perfectly well that irritation of the sole of the foot, for instance, and to use an oft-repeated illustration, produces contraction in the muscles of the face, but we certainly do not regard the sole of the foot as a psycho-motor centre, especially the motor organ that produces the appearance of laughter. The same method of reasoning applies to the convolutions of the brain; and, if galvanism applied there produces movements, there is no reason whatever to conclude, from that fact alone, that a motor centre has been acted upon. It may be that a motor centre has been excited, but it has been by a propagated influence, and a reflex action has been the consequence.

This view certainly is more in harmony with facts than the one generally admitted. If those parts of the brain were motor centres, certainly we should see movements produced by all irritants as well as by galvanism; and, also, when those parts are removed, of course the motor centres would be removed; there would always be paralysis which would be persistent. What is observed in animals is an apparent paralysis after the ablation of these parts, but, when we analyze this appearance of paralysis, it is found to be something like the general paralysis of the insane, in which the convolutions are inflamed, and in which there is also great irritation of other portions of brain tissue. You will find that it is a disorder in the action of the will, and not loss of power, that exists. There is no real paralysis in that case, and certainly the fact, if it lead to any direct conclusion, would show that the part removed was the part which served to maintain the equilibrium of the body, and not that which presides over voluntary motor action. Even the second conclusion, that the convolutions maintain the equilibrium of the body, is not correct, as you will see by this fact, that removal of only part of the pretended motor centre, leaving the greater portion undisturbed, there will be more disorder of movement than when all the organ is removed; there is no paralysis. In these two cases, one in which a portion of the motor centre is removed, and the other in which more than the entire organ is removed, there should be greater paralysis following the latter operation, if there is any difference at all. In many cases there is no appearance of paralysis.

DISAPPEARANCE OF PARALYSIS UPON ONE SIDE PRODUCED BY REMOVAL OF ALL THE MOTOR CENTRES UPON THE SAME SIDE.

It has been found that in cases of paralysis affecting one side of the body, if the so-called motor centres

upon the healthy side of the brain are removed, the paralysis first produced disappears. The experimenter should have found a second paralysis, and no influence whatever should have been exerted upon the paralysis first produced. This fact is decisive in showing that by removing so-called psycho-motor centres and by irritating another part of the nervous system, you can produce a cessation of the cause which produces the first disorder.

The experiment has been made of removing one-half of the brain, when paralysis appeared upon the opposite side of the body. The other half was then removed, and, instead of paralysis, such as was produced after the removal of the first half, the paralysis following the removal of the first half disappeared.

One-half of the brain was removed, and a paralysis followed apparently due to removal of voluntary motor centres; all had been carried away, but removal of the remaining half of the brain, instead of being followed by a second paralysis upon the opposite side of the body, was followed by cure of the paralysis produced by removal of the first half of the brain. This mode of treatment, however, I should not advise in the human species.

PARALYSIS CAUSED BY INHIBITORY ACTION.

From this experiment it can be seen that there is no reason to believe that paralysis depends upon loss of an organ employed by the will-power, and the result of an analysis of this experiment as well as the effect of disease, shows that paralysis, in most cases, is due to irritation which starts from the place where the disease is; from that point spreads its influence to many parts of the cerebro-spinal axis, and so produces by inhibition a cessation of the activity of those cells, and thereby produces paralysis.

CLINICAL FACTS RELATING TO THE CONVOLUTIONS OF THE BRAIN.

What are the clinical facts relating to the convolutions of the brain? One of the ablest physicians in Europe, Prof. Charcot, has shown from clinical facts that certain parts of the convolutions of the brain possess more power than others in producing paralysis. There is no doubt but that disease in front and back of the fissure of Rolando, more frequently than in other parts, gives rise to paralysis. But when you study the facts, one after another, you will find but few among those given by Charcot, and aided by others scattered through the medical journals, which are in harmony with the admitted theory.

According to the admitted theory, the parts in front and behind the fissure of Rolando are those which serve chiefly for movements in the arm and the leg—that is, they are the psycho-motor centres for those parts of the body.

Still there are many cases in which disease has destroyed those parts without producing any marked paralysis. Certainly, such facts are quite sufficient to show that the conclusion reached is false.

Then if you will examine the facts which seem to be in harmony with the theory, you will find that in a great many cases disease occupying only a small part of this region in the brain has been followed by hemiplegia. In other cases we find that the face is paralyzed, together with the arm, while the lesion is in the part considered to be the motor centre for the leg. In fact, the discrepancies between the details of the cases and the conclusions drawn by many physiologists from experiments, are certainly quite decisive against the admitted theory.

Is it possible, however, to make a diagnosis of disease existing in the convolutions of the brain, even when the disease is elsewhere than in the so-called psycho-motor centres? It is so sometimes. If there is disease in the convolutions, together with paralysis, there is great probability that convulsions will occur.

There is scarcely a part of the brain which is more liable to produce convulsions than the convolutions. So much is this the case, that Wilkes, of Guy's Hospital, thought that epilepsy depended upon disease in the convolutions of the brain. I committed another mistake equally apparent, when I regarded epilepsy as always the result of disease of the membranes of the brain, either outside or in the ventricles. This view of mine found many facts in its favor, and other facts against it. It is quite certain, however, that both the membranes and the convolutions of the brain have some power in producing convulsions. So, if you find convulsions and paralysis, there will be some reason to examine further for the purpose of determining whether or not the disease is in the convolutions.

It is extremely frequent, in cases of extended disease in the convolutions, to find disorder of movements, if movement remains. The paralysis is not simply loss of voluntary action, but loss with some disorder of movement. Then, besides, this paralysis will be much more limited than for disease in other parts of the brain; it is generally limited to the arm, or at least chiefly marked in the arm. The arm is frequently paralyzed, without reference to the seat of the disease in the brain.

Moreover, the convolutions of the brain are employed, in a great measure at least, in the exercise of the noblest faculties of the mind; therefore, there should be some disorder of the mental faculties when they are the seat of disease. If the disease exists upon the left side of the brain, whether in the third convolution or elsewhere, there will be loss of memory of words. Very frequently there will be complete loss of power of expressing ideas by speech. There are, therefore, certain symptoms which show that the disease that produces the paralysis is in the convolutions of the brain.

Other features are very interesting. There is very frequently contracture—that is, rigidity—chiefly in the arm and upon the opposite side, if there has been prolonged disease, such as inflammation, tumor, etc. This rigidity Prof. Charcot has endeavored to explain on the ground of secondary degeneration, and he has the credit of showing that this secondary degeneration extends to the pons varolii, the medulla oblongata, and to the spinal cord, when the seat of the disease which produces the paralysis is in front or behind the fissure of Rolando.

PECULIAR SYMPTOMS.

Diseases in the convolutions also present peculiar features that assist in diagnosis. My friend and former assistant, Dr. J. Hughlings Jackson, was the first to clearly show the features which belong to these cases.

If epilepsy or only convulsions appear as the result of disease in the convolutions, it very frequently is the case that the arm especially, sometimes the leg, is seized by cramp preceding the attack.

Sometimes one muscle, sometimes many, will contract very firmly. Sometimes with such contractions there are peculiar sensations, as if insects are crawling over the surface, burning or pricking sensations, etc., occurring in the arm or the leg, and for a while the symptoms are localized in one limb only.

These features are not absolutely peculiar to disease in these parts, but certainly they occur by far

more frequently with disease there than elsewhere; so you will see that diagnosis of disease in the convolutions of the brain is possible, from the facts which have been stated. I cannot review all the symptoms which will conduct us to the cause of paralysis, but I will summarize them in as few words as possible.

If you find, with paralysis in the limbs, paralysis in the face upon the opposite side, you have reason to look upon the pons varolii as being the region in which the disease is located.

If you find paralysis with hemiopia, then there is likelihood that the disease is in the tubercula quadrigemina.

If you find paralysis coexistent with complete loss of action in the third pair of nerves upon one side, the paralysis being in the limbs upon the opposite side of the body, then you have, in all probability, to deal with disease in one of the crura cerebri. These are the most important features, and those which are most frequently observed. As regards the details given in the preceding lectures, my time is too limited to give a complete summary.

CONVULSIONS ASSOCIATED WITH BRAIN DISEASE.

I pass now to the study of convulsions in connection with brain disease.

Convulsions, as you well know, may appear without epilepsy; they are certainly something quite distinct from epilepsy proper. The essential characteristics of epilepsy are recurrence by attacks with loss of consciousness. In fact, there is no need of any convulsions whatever to the existence of epilepsy. In *petit mal* there is no necessity for convulsions or rigidity of any muscle in the body. There may be a mere cessation of consciousness, from many causes, but for the existence of epilepsy there must have been a few such attacks. As you well know, loss of consciousness itself cannot characterize epilepsy. If, however, there is no syncopal state, the heart continues to beat, and in a number of attacks there has been loss of consciousness, then the patient has epilepsy. In almost every case, in fact, in my long experience, I have rarely seen a case in which there was not convulsive movement of some of the muscles of the face or neck, and although there may be such cases, epilepsy is, however, usually characterized by these two series of manifestation—loss of consciousness and two kinds of convulsions: 1. Tonic spasms, manifested almost invariably in the beginning of the attack; and 2. Clonic convulsions. These two varieties of convulsions, existing in succession, accompanied by loss of consciousness and occurring in repeated attacks, make complete epilepsy.

But in brain disease we very frequently do not have to deal with epilepsy proper when the patient has convulsions. Frequently, convulsions exist without loss of consciousness. In idiopathic epilepsy the convulsions are almost invariably upon both sides of the body; both sides act alike. In convulsions dependent upon brain disease, it is very rarely the case that both sides of the body are affected. Convulsions occurring upon one side of the body may, therefore, lead to the suspicion that there is brain disease existing as the cause.

Still more, convulsions limited to one arm or leg, or to one side of the face, to some muscles of one eye, very frequently depend upon brain disease, and you do not see such convulsions in idiopathic epilepsy.

Again, in most attacks of epilepsy caused by brain disease, what was described by Galen and other physicians of his day, namely, an *aura*, occurs before each attack.

CURABILITY OF EPILEPSY DEPENDENT UPON BRAIN DISEASE.

There are other important features of epilepsy dependent upon brain disease, and one especially to be mentioned is its curability.

We can hardly say that one out of many hundred cases of idiopathic epilepsy is ever cured.

When epilepsy depends upon disease in certain parts of the brain, especially when the base of the brain is diseased, it can sometimes be cured rather rapidly; that is, we can rather rapidly prevent the manifestations of the disease. Do not understand that I mean the patient can be removed from danger very quickly, for he is liable to attacks of epilepsy for perhaps two years after all manifestations of the disease have been prevented, and apparent cure has been effected within two weeks.

There is no doubt that epilepsy dependent upon brain disease is caused simply by irritation of certain parts over which a great and controlling influence is exerted by two modes of treatment. I think the time is not far distant when we may be able to do for paralysis as much as we are now able to do for epilepsy. For, according to the doctrine which I have here taught, paralysis is nothing more than a manifestation of irritation the same as epilepsy.

If irritation, starting from disease, goes in a certain course, it will produce an inhibitory effect—produce a cessation of activity—and then there is paralysis. If the irritation goes to cells which are able to produce reflex action, instead of to motor cells, then convulsions will be produced. In both cases the same thing exists at the beginning, and certainly what is essential in both cases is identical; that is, irritation starting from a diseased part. Such irritation is propagated to other parts, and produces either paralysis or convulsions, according to the properties in the part upon which it acts.

If, therefore, we can cure epilepsy dependent upon brain disease, why cannot we find means to cure paralysis dependent upon a precisely similar cause? What has been found out as regards anæsthesia is most important in this respect.

THE AURA AND LOSS OF CONSCIOUSNESS.

I pass now to the study of some of the features which may lead to diagnosis in cases of convulsions due to disease in the brain, as well as to other forms of epileptic manifestations.

These features are chiefly the *aura* and the loss of consciousness; there are also one or two other points.

As regards the aura, I wish that every young man, if not others, would study every case of epilepsy thoroughly and carefully, to ascertain whether or not what I have to say exists. It is true that it is very difficult for the busy practitioner to examine every part of the surface of the entire body, from the nails of each extremity to the trunk, and then the entire trunk, etc., and I confess that I have not taken the trouble to do it, yet I think we fail as physicians to perform our duty to our patients by such neglect.

IRRITATION OF CERTAIN PARTS MAY PRODUCE AN EPILEPTIC SEIZURE.

I will state the facts which have led me to make these remarks. I have ascertained many times that there are certain parts of the body, in epileptics, which, when irritated by one means or another, give rise to the beginning of an attack, and sometimes to a full

attack, of the disease. I have not dared to push the irritation so far as to produce an attack, yet in a few cases, and in a few only, an attack has been produced in this manner. Indeed, I do not wish ever to produce an attack; still, it is important to determine whether we have to deal with epilepsy dependent upon organic disease in the brain, or some other kind of epilepsy.

The importance of being able to determine whether an attack can be produced by irritating the part from which the *aura* starts, or by irritating some particular part of the body, is very great. For if it is found that there is a place, either with or without an aura, which, when irritated, gives rise to an attack of loss of consciousness and convulsions, it will be found that counter-irritation has great power in effecting a cure in those patients. So if you ever have the misfortune to produce an attack of epilepsy in this manner, the patient may be repaid, inasmuch as counter-irritation, applied near that part, may be the means of curing or diminishing the severity of the disease.

The aura may appear in any part of the body, so it is thought that irritation of the skin upon the back of the neck, under the ear, upon the back at the level of the first and second dorsal nerves, upon the limbs, in some cases upon the breasts, and many other places, may be a means of cure for epilepsy.

VARIETIES OF AURA.

The *aura* may vary immensely when due to organic disease in the brain. It may be a mere sensation, or some peculiar muscular movement. I had a case in London in which there was a sudden and irresistible contraction of the bladder two or three hours before an attack, such as to cause the urine to flow out with great rapidity.

There is no muscle in the body which cannot be specially affected under such circumstances, and the muscles of the arms, of the abdomen, of the chest, etc., may contract the same as did the muscle in my patient's bladder.

As you know, there are muscular fibres in the walls of the blood-vessels, and these may contract some time before the occurrence of an attack of epilepsy. If this occurs in the blood-vessels of the face, there will be marked paleness in that part before the attack.

It matters not when such contraction of blood-vessels takes place, there is a diminution of temperature, and if the part is superficial, a marked paleness can be observed.

There is, therefore, a kind of aura, which consists in *muscular contractions in various parts of the body.* The important point, for the sake of applying means of treatment, is to determine whether irritation of a certain place *constantly* produces an attack, or at least the place is one in which very frequently some action takes place before the occurrence of an attack. If such is the case, there is good prospect of giving relief by applying counter-irritation near the affected part.

There is another kind of aura, which may be called an *aura of sensation.* This sensation is exceedingly variable. Generally, however, it consists in some indefinable feeling; most epileptics will say that they cannot describe the sensation. The peculiarity is, that the sensation is like itself and like nothing else. It is a distinct feeling that belongs to that peculiar state. Some physicians have endeavored to restrict the application of the term aura to this peculiar sensation, but it should be applied to either any peculiar muscular movement, or to any peculiar sensation which constantly takes place before the occurrence of the attacks.

If the aura takes place some time before the occurrence of the attack, there is a very fair chance indeed of saving the patient from the fit.

Of the means of treatment to be employed, I will speak in my next lecture.

LOSS OF CONSCIOUSNESS.

I pass now to the explanation of the loss of consciousness associated with disease in the brain.

In 1857, in this country, I tried to show, what is now admitted by physiologists and physicians, that the loss of consciousness is the result of contraction of blood-vessels in the central lobes. I am very sorry that my views have been followed in that respect, for I think now that it is only partly true, if true at all. It is quite certain that the blood-vessels in the brain contract, so that the fact itself is out of the question; but neither in the case of loss of consciousness in epilepsy, nor in sleep, as maintained by Dr. Hammond, is that contraction essential. The contraction of blood-vessels in the cerebral lobes is not essential to the production of sleep. For in animals both sympathetic nerves have been divided, giving rise to dilatation of the blood-vessels and consequent congestion in the cerebral lobes, and yet sleep took place just as completely, perfectly, and refreshingly, as if nothing had been done; as if the blood-vessels contracted. So it is clear that, although contraction of blood-vessels is something that occurs during sleep, it is not the something which causes sleep, and it is not essential to the existence of sleep. To employ remedies, therefore, which we know to produce contraction of the blood-vessels in the brain, with the view of producing sleep, is all wrong.

The cause of loss of consciousness in epilepsy will be considered in my next lecture.

Original Communications.

CLINICAL CONTRIBUTIONS.

By D. B. ST. JOHN ROOSA, M.D., and EDWARD T. ELY, M.D.

The following are a few cases lately observed in private practice:

METASTATIC CHOROIDITIS.

In the following cases the diagnosis of metastatic choroiditis was made. It is regretted that, owing to the pressure of other work, the histories were not more fully recorded. However, as no doubt was felt about the diagnosis, they may be of some value, although so incomplete. The first patient was seen through the courtesy of Dr. Oscar Rieffel, who was also kind enough to furnish some notes regarding her illness.

Mrs. F., aged 42. Was confined Jan. 4th. Five days after delivery she became "feverish"—according to the story of the midwife who attended her. She also had profuse uterine hemorrhages. On the tenth day she was seen by Dr. Rieffel, who found her suffering from septicæmia and endometritis, and who removed a piece of retained placenta, about the size of an orange and extremely putrid. On Jan. 28d one of her eyes became inflamed, and on the 24th she was found to have suppurative choroiditis. The lids and conjunctiva were very œdematous, the vitreous cloudy, and vision reduced to perception of light. She was

directed to use cold applications, atropine, and such general measures as seemed indicated. The disease ended in panophthalmitis, rupture of the globe, and atrophy. At one time there was exophthalmos from orbital cellulitis, and pus was evacuated through an opening made in the conjunctiva over the insertion of the external rectus muscle. At the time the ocular inflammation appeared there was also a suppurative inflammation of one of the knee-joints, which had begun two days before. On Feb. 12th, Dr. Rieffel ceased his visits at the request of the patient, who considered herself out of danger. After five days he was recalled to find her much worse. On March 7th she died. The inflammation of the eye lasted about three weeks.

The next case was seen with Dr. W. J. Welch.

Sister of Charity, aged 46. Had a severe attack of croupous pneumonia in the left lung, in January. On the eighth day of the disease, signs of cardiac distress suddenly appeared, the heart working slowly and intermittently. This condition continued five or six days; recovering then under the use of stimulants. Convalescence then progressed slowly. One day, in the third week of her illness, she felt pains in her left eye, "as if a knife were being run through it." The next day the eye appeared inflamed, and on the day after that, "the sight was gone." At the first consultation she presented the symptoms of suppurative irido-choroiditis. There was great chemosis, and some pus in the anterior chamber. She was treated by cold applications, atropine, paracentesis of the cornea, etc. The disease ended in atrophy of the globe.

At the time the eye became inflamed the patient also complained of *soreness* about the right shoulder-joint, and extending down the arm. This continued to annoy her for about six weeks. There was some tenderness about the joint, but no swelling.

The third case was one seen in consultation with Dr. J. L. Campbell, who has kindly furnished notes of the previous history:

Mrs. W., aged 33. Was confined Oct. 4th. One week later she was attacked by fever, typho-malarial in type. On the 16th she complained of a sudden, sharp pain in the right eye, and on the same day she found that the vision of that eye was wholly lost. When seen by Dr. C. three days later, there was extreme congestion of the conjunctiva, and marked chemosis. There was also exophthalmos, which increased for the next four or five days, and then began to subside. The onset of the disease was not marked by a chill, and there was not very severe pain at any period. The eye was treated with atropine and warm applications. A week after the eye became inflamed, an acute synovitis of the left knee-joint, with effusion, appeared.

To-day, Oct. 27th, the right eye presents a turbid cornea, irregular pupil, and opaque vitreous. Some exophthalmos. No pain. No perception of light.

The striking feature of these cases is the fatal result to the eye, to avert which, all treatment seems to be powerless. If there be an incipient stage of hyperæmia of the choroid or retina, which might be combated by local antiphlogistics, it is not known. When the attention is first called to the eye, suppuration has already occurred, and then treatment can only be palliative. Physicians attending patients with symptoms of blood-poisoning, may, perhaps, by very careful observation and daily inquiry as to the condition of the vision, soon settle this point, and, possibly, a treatment may be suggested that will prevent the fatal formation of pus in the eye.

ANÆMIA OF RETINA—CONCENTRIC LIMITATION OF VISUAL FIELD—EFFECTS OF QUININE.

Dr. A., aged 27. March 10, 1876. Says that he was "totally blind" for half an hour this morning, just after breakfast. When vision returned it was very much blurred. For an hour or more could only see the lines in a newspaper, being unable to distinguish any of the letters. Sees very well now (11 A.M.), but objects still appear somewhat blurred. Complains of nothing else. Is subject to neuralgia. Has shortness of breath after exertion. Has had rheumatism. Has a heart-murmur, which has been pronounced to be mitral regurgitant by one authority, and anæmic by another. Works hard. Sits up very late at night. Smokes a great many cigarettes. Looks pale.

V = $\frac{20}{20}$ both eyes. Accommodation normal. Visual fields contracted concentrically. Nothing seen by ophthalmoscope, except that retinal arteries appear small, and capillary circulation in optic discs deficient (?).

Directed to stop smoking and to take ten grains sulphate quinia.

March 16th. Feels the same. Quinine appeared to have no effect. Visual fields the same. Vision 1.

March 18th. Visual fields the same. Took 15 grains of quinine at 11.40 A.M. No immediate effect. Took 15 grains more at 12.15. At 12:30 had flushing of face, suffusion of conjunctivæ, ptosis right upper lid, and slight tinnitus aurium. Says that face feels swollen. Pulse 108, same as before medicine was given. No change in visual fields. No change can be detected in fundus.

March 29th.—Has been in the country since the 18th. Feels very much better. Has had night-blindness while away. Noticed it the first night of his absence, when he walked out before dark, and was unable to find his way home again without assistance. Thinks he would be troubled in going about at evening now, if it were not for the street-lamps. Sight is clear during the day: V = 1. Fields, *normal.* Right field larger than on March 16th by 10 inches in vertical, and 13 inches in horizontal diameter. Left field increased 5 inches in vertical, and 11 inches in horizontal diameter.

October 16th.—The patient continues to use tobacco, and to suffer from visual symptoms; *i. e.*, he complains of want of sharpness of vision, and also of inability to continue work with his eyes. Has an anæmic appearance. Ophthalmoscope shows appearances of slight latent hypermetropia, and the patient's asthenopia is partially relieved by convex glasses.

A POLYPUS IN THE EAR FOR FORTY YEARS (?)

In the following case it seemed probable, from the patient's statements, that there had been a polypus in his ear for about forty years. During that period there had been constant discharge from the ear, and, in cleansing the ear, etc., the patient had felt something obstructing the canal.

Mr. H., aged 56. Says that he has had a discharge from his right ear ever since he was a small boy. He has "felt something filling that ear" since the age of 15. Never has had any examination or treatment.

H. D.: R. E., $\frac{0}{40}$; L. E., $\frac{18}{40}$.

Tuning-fork heard better on right side.

A large polypus was seen filling right external auditory canal, and attached to the upper and posterior walls. It was removed by a snare, and the space behind it was found packed full of dried secretions. After removing the latter, the drumhead was seen to be cicatricial, and without any perforation. The

patient was seen twice after this, and roughened bone detected just at the junction of the cartilaginous and osseous canal. The patient was rather attached than otherwise to the polypus, and seemed to regret its removal. He has not been seen since the third visit, when there was a slight discharge from the diseased part.

ACUTE CATARRH OF THE MIDDLE EAR, CAUSED BY SNUFFING WATER UP THE NOSTRILS.

No further proof is needed of the danger of introducing fluids into the nostrils, and the following case is reported only because its features are so clearly marked. The fact that the patient had already lost the function of one ear in a similar way gives additional value to his testimony. The use of the nasal-douche and its modifications has been much debated, and is still a question of controversy. It is freely granted that it may be used by *the surgeon himself* upon hundreds of cases without harm, as has been shown in a recent paper by Cassells.* The only point ever sought to be established by the writer is that this therapeutic measure cannot be safely entrusted to patients. The very best of them are often incompetent to remember and carry out the various "precautions" given them, and, in this sense, it is impossible always to tell beforehand that your case is a "proper" one to be allowed to apply the remedy for himself. Moreover, in some cases, harm has certainly resulted where every direction was followed by the patient, and even where the operator was an educated physician. Thus a certain small percentage are constantly suffering injury, which to one placing a high value upon an ear, is not compensated for by all the advantages which this treatment of naso-pharyngeal catarrh is supposed to offer.

Mr. F. was snuffing water up his nose on account of nasal catarrh, and, while blowing it out again, he "felt a drop enter the right ear." Had pain in that ear immediately (this was at noon), which increased in severity, and at midnight was unbearable. Took large doses of morphine with only partial relief. Next morning he applied for advice, and was found to be suffering great pain, with some fever. The right auditory canal was red and swollen at the bottom, and the drumhead very red and somewhat bulged outwards. H. D. was $\frac{c}{40}$. A paracentesis of the drumhead was made at once, and the hot douche ordered to be used every hour. Immediately after the operation the pain disappeared, and did not return until five days later, when it was relieved by leeching. Under the usual treatment the inflammation subsided, and the hearing was restored. The water which was used in the nostrils was cool and not medicated.

Four years ago this patient felt water enter his left ear while using the nasal-douche, and had acute catarrh of that ear, followed by suppuration and deafness. The H. D. on that side was $\frac{0}{40}$, and the drumhead was cicatricial.

INJURY OF AUDITORY NERVE BY A BLOW FROM A FUR GLOVE (?)—EFFECTS OF STRYCHNIA.

The following case presents symptoms of disease of the middle ear as well as of the auditory nerve. The points of interest are regarding the causation of the latter, and the effects of treatment.

Mr. H., aged 35. Says that four years ago he was struck on the right ear, with a fur glove, in sport. The blow caused no pain, but occasioned a sensation like that of an electric shock running through the whole right side of his body. Noticed deafness and tinnitus on the right side *immediately*. Feels sure that the deafness and tinnitus were caused by the blow from the glove. Never noticed anything wrong about his ears before. Two years ago he noticed deafness and tinnitus on the left side, which have increased since. Never has had pain or discharge in either ear. Says that he hears somewhat better when riding in the cars. Music sounds *false* to him. General health good. Never has noticed any catarrhal trouble in the throat.

H. D.: R. E., $\frac{0}{40}$; L. E., $\frac{P}{40}$. Voice, 1 foot behind back.

Tuning-fork heard better on left side.

Right drumhead: Sunken; only upper part of malleus seen; atrophy, outer and middle layers; reddish color.

Left drumhead: Sunken; diffuse light-spot; loss of translucency.

After being treated for a short time by hypodermic injections of strychnia, the voice was heard at ten feet, and the watch as before. The patient then passed from under observation, so that it is not possible to say whether the improved hearing was permanent, and whether it was really due to the strychnia. Inflation was tried without benefit.

INJURY OF THE COCHLEA FROM CANNONADING—EFFECTS OF QUININE ON THE EAR.

The following case was considered to be one of chronic catarrh of the middle ears, with affection of the cochlea. While under treatment it happened to furnish an illustration of the effects of quinine upon the ears.

Dr. P., aged 51. In 1870, was exposed to heavy cannonading, after which he had sudden tinnitus and impairment of hearing on both sides. These symptoms passed away in great measure within a short time. Since then he has had the tinnitus only occasionally. The deafness has not been enough to annoy him until lately. Thinks the right ear has always been the worse. A year and a half ago he noticed that he heard the *click* preceding the striking of his clock, but did not hear the strike. Now he hears the strike, but not the click. Hears worse in a noisy place. Has been troubled with irritation and excess of secretion in pharynx for a long time. Health otherwise excellent.

H. D.: R. E., $\frac{1}{40}$; L. E., $\frac{0}{40}$. Voice, 50 feet behind back.

Tuning-fork placed on teeth is heard alike. Plugging either ear makes no difference. Placed on forehead or vertex is heard alike, but better on left side when plugged. Placed on mastoid heard better on left side than on right; plugging left ear intensifies sound of fork; plugging the right ear makes no difference. All the notes of a piano are heard well with the left ear. The right ear has partially lost its perception of some of the lower and some of the upper notes, but hears the others well.

Right drumhead: Opaque. Light-spot, narrow and divided.

Left drumhead: Opaque. Good light-spot.

Pharynx catarrhal.

Inflation for three weeks improved the hearing for the watch to $\frac{0}{40}$ on both sides.

One morning, while under treatment, the patient came complaining of great "stuffiness" and tinnitus in both ears. During the preceding twenty-four hours he had taken 38 grains of quinine for neuralgia. The hearing for the watch was $\frac{1}{40}$ R. E., and $\frac{0}{40}$ L. E. There was intense redness along each malleus-handle.

* Dublin Journal Medical Science, June 1, 1877.

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

Durel's Syrup of Tar and Iron.

Prepared by DUREL, Pharmacist, Paris.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron, is a desideratum which has at last been attained in this preparation. The indications for such a remedy are many, but it has been found especially useful in ***Chlorosis, Bronchial Catarrh, Catarrh of the Bladder, Chronic Uterine Discharges***, depending upon an enfeebled or relaxed state of the system.

It is sold by chemists generally.

E. FOUGERA & CO.'S
MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of **Ether; Chloroform; Oil of Turpentine; Apiol;**
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

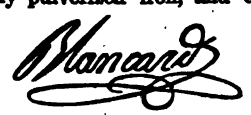
The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

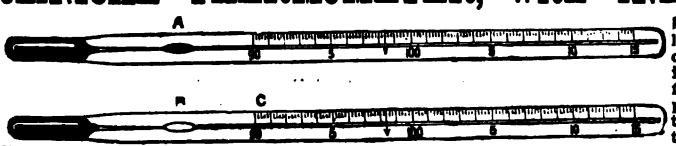
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of



Pharmacien, No. 40 Rue Bonaparte, Paris, without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING
CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $6 00

We also offer:

No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 3 50

Sent free by mail on receipt of price. Manufactured by L. CASELLA, London.

E. FOUGERA & CO., Agents, 30 North William St. New York.

treatment, then what, if any, general rule shall guide us?

Dr. Packard says: "If repeated operations are necessary, it becomes a question whether aspiration should not give place to the operation by incision."

"If the secretion of pus is itself decreasing, and the constitutional disturbance is moderate, and especially in a young subject, we have reason to hope for an ultimate cure by aspiration. If, on the other hand, the pain and constitutional irritation continue severe, and the pus rapidly reaccumulates, I think there is no question that the pleural cavity should be opened by an incision large enough to admit of a ready evacuation of its contents, and of the manipulations necessary in washing it out, if the pus should be of an irritating quality."

Now, in place of the foregoing, I would offer the following amendment, making the line between the different operations to be more arbitrary, and as follows: If the contents of the pleural cavity is serum, I would always aspirate; but, if it is pus, I would always use as large a trocar and canula as possible, or make a free incision with the knife, and then use the antiseptic wash, as described in the cases given above. In most cases the aspirator may be first used to test the character of the effusion. With our present facilities for the antiseptic treatment of disease, and for preventing infection in surgical operations, we are able to more than compensate for any evil resulting from the admission of air into the suppurating pleural cavity. In fact, the operation for the relief of pyothorax should be performed as much for the purpose of disinfecting the diseased cavity as for merely evacuating its contents.

Again, on the question of the time for operative measures to be resorted to, Dr. Packard's article has the following: "The time for interference must differ with differing cases. A latent pleuritic effusion, the result of a low grade of inflammatory action, and containing very little fibrin, while all the more likely to degenerate into pus, will not make many or strong adhesions, and, in this respect, may safely be left for weeks." [Query—What is the advantage of leaving such a case for weeks? Surely the risks of thus leaving it are greater than any incident to the early use of the aspirator?] "But," says the article, "an acute pleurisy is a different thing, and I think three weeks is the outside of safety against the formation of permanent and disastrous adhesions." [Query—Is it not well to avoid the outside limits, and relieve the oppressed absorbents while their action may yet be restored, and while the effusion is yet only serous in character?] As for evidence of the correctness of the views here given, both concerning the kind of operation and the best time for operative interference, the reader is referred to the history of every case given in Dr. Packard's article. I will add the brief notes of two cases, the history and results of which show the advantage of the use of the open canula and the antiseptic washings in advanced pyothorax.

I. A young man, 19 years old, the son of a farmer, presented himself for treatment in June, 1874, having ten weeks before suffered from a severe attack of pleuro-pneumonia, while at work in the woods away from home. There was emaciation, with great exhaustion, dyspnœa, a rapid and feeble pulse, septicæmia, swelling of the feet, and the physical signs of an immense accumulation of fluid in the right pleural cavity. Paracentesis was performed by means of an aspirator, and five pints of fetid pus drawn off, no air being allowed to enter the cavity. The operation was repeated four times in four weeks, and an average of four pints drawn each time. At the second and fourth operation blood was mingled with the pus in the receiver of the aspirator. The blood was fresh and readily coagulated. Any attempt to exhaust the gas from the cavity, by continuing to work the aspirator after the pus had ceased to flow, caused distress to the patient, and a renewal of the hemorrhage. Each operation in a measure relieved the more urgent symptoms of dyspnœa and septicæmia, but at the end of the month the patient was unable to move in bed unaided, suffered from hectic, was extremely emaciated, and was evidently failing. I now adopted the plan of drawing the pus through a large canula without the aspirator, and of performing the operation as often as every second or third day, and, after a short time, every day, allowing each time the free ingress of air. A very weak solution of carbolic acid in warm water was used as an injection at each operation, a small quantity of the wash being thrown in, and this drawn off, and then another injection made until the fluid drawn was quite clean. The patient was kept up on wine, iron, and quinine, and upon animal food, consisting largely of wild game. From the time of the change of treatment from the use of the aspirator to that of the simple canula, and of the more frequent performance of the operation, with the use of the antiseptic wash, there was steady improvement in the condition of the patient, but recovery was slow, and the adhesions were such as never to allow the lung to expand to any considerable extent. At the end of eight months the thorax was an inch less in circumference on this side at the level of the nipple than on the other side, and a line through the chest, from the nipple backwards to the lower angle of the scapula, is at least an inch shorter than the same on the other side. My notes at this time, eight months after the first aspiration, state that the canula is at present introduced morning and night, and about three or four ounces of purulent serum drawn at each time. A careful record of the amount of pus obtained, and which has varied in quantity at different times, has been kept, and the aggregate is upwards of 100 pints. Carbolic acid, chlorate of potassa, port wine, and the permanganate of potassa have successively been used in the injections. Cod-liver oil, with the phosphate of lime, has been given largely, together with quinine and the mineral acids. Three years and eight months have now passed, and there is yet a fistulous opening communicating with a small cavity. Of late a silver tube has been worn, allowing the slight discharge to take place constantly, and there is evidence of a more rapid diminution in the size of the cavity since the maintenance of this constant drainage. It is probable that an excision of a section of the rib at the place of the puncture, thereby allowing a more free and constant evacuation of the pus, would have hastened the process of cure.

II. Dr. M. Hagan, of St. Paul, Minn., reports a case in which he performed thoracentesis in a man who had been attacked with pleuro-pneumonia one month before. Two quarts of pus were drawn at the first operation with the trocar. A piece of gum elastic catheter was used as a permanent drainage-tube. After two or three days the cavity was washed out with the carbolic acid water, and several days after a weak solution of sulphate of zinc was used as a wash alternately with the carbolic acid. At the end of six months the discharge was reduced to about a half ounce daily. In one year the patient had nearly recovered, the lung had expanded, but there was still a slight discharge of purulent matter from a small pocket which seemed to be gradually closing.

In the light of our experience it is fair to conclude,

first, that, if in these cases the aspirator could have been used early, while effusion was yet serous, many months of suffering and great risks to life would have been prevented; and, second, that, in the late operation, only the free evacuation, permanent drainage, and antiseptic treatment were admissible.

INTESTINAL OBSTRUCTION

Successfully Treated by the Injection of Liquid Effervescing Solutions.

By P. A. HARRIS, M.D.,

Dover, N. J.

G. Y., æt. 25, American, laborer; when first seen, on the 12th of July, 1877, was suffering most excruciating pain in the hypogastric region, just to the right of the median line. It commenced two days previous, and had grown more and more severe. He stated that nothing had passed his bowels for three or four days; that a doctor had been in attendance for two days, and was discharged previous to securing my services. The physician had diagnosed the case as one of obstruction of the bowels, and the treatment had consisted of large and repeated doses of physic.

Upon examination I found marked tenderness at the seat of pain, but no appreciable swelling at that point. There was frequent vomiting, but it was not stercoraceous in character. I placed the patient in the knee-chest position, and used large injections of warm soapy water. Cathartic doses of calomel were given at regular intervals for two days, with negative effect. This was followed by varied treatment, consisting of forcible injections of air, of warm water in the knee-chest position, of hot water under chloroform anæsthesia, and a variety of cathartic enemata, all of which proved inefficacious. Subcutaneous injections of morphia were given to relieve the severe pain. On the 15th there was stercoraceous vomiting; on the 17th the abdomen first began to be tympanitic. The tympanitis continued to increase until the 19th, when the pulse became very weak, the countenance anxious, with marked general emaciation.

Dr. Crittenden, who had seen the case several times with me, kindly called my attention to a case then recently reported from Dr. Southey's clinic at St. Bartholomew's Hospital, London, in which a patient had been successfully treated for intussusception by the force obtained from the disengagement of gas from a syphon bottle of soda-water. With a view of employing the same principle by a different method, I made a few experiments at my office with tartaric acid and the bicarbonate of soda, obtaining thereby an approximate estimate of the respective quantities of these reagents required in solution to disengage a given quantity of gas. On July 20th I made a solution of 140 grammes of bicarbonate of soda in the smallest possible quantity of water at 100° F., also a solution of 120 grammes of tartaric acid in like manner. Gave chloroform; introduced long rectal tube, attached a syringe, and injected a little more than one-third of the solution of soda. The same relative quantity of the acid solution was then injected, the rectum having been grasped from behind and pushed forcibly forward against the large tube to prevent the escape of gas. The abdomen, already greatly distended, was still further expanded by the prompt disengagement of gas. The experiment was again made, using about the same quantities of the solutions as before, with the same appreciable effect. A want of experience made it all the more difficult to hold the rectum sufficiently tight to prevent considerable escape of the gas at each trial. With the solution remaining, a third experiment was made. In this great care was used to prevent the escape of the gas per anum. Again there was decided abdominal expansion, but this time it was accompanied by a sharp, migratory gurgling. As this gurgling was not heard at either of the other trials, and from the fact that the abdominal expansion was greater than it had been before, it is safe to infer from what followed that this last effort was the means of overcoming the obstruction. Mild cathartic enemata were now given as often as expelled, and the evacuations carefully examined.

A few hours after the operation, the tympanites, pain, and vomiting began to subside. The improvement continued marked and general, and on the 22d a free alvine evacuation took place. Thus a period of thirteen days had elapsed during which not a particle of fecal matter passed per rectum. Aside from a strong tendency to diarrhœa, the convalescence was void of further interest. Neither the history of the patient nor a careful rectal and abdominal examination enabled me to determine the precise nature of the obstruction.

The treatment of intussusception and intestinal occlusion by the forcible injection of air has often been successful, but it has likewise often failed. The difficult and imperfect methods of applying it would doubtless account in a measure for many failures reported from its use.

Any amount of distending force can be obtained from the disengagement of gas by the action of acids upon certain bases; and when we have these chemicals in the form of bland solutions, as tartaric acid and bicarbonate of soda, we have only to inject them into the rectum separately, and prevent escape of the power generated.

For an adult, inject 50 grammes of bicarbonate of soda in solution (smallest quantity of water at 100° F.), and immediately follow it with 45 grammes of tartaric acid in solution. If there be no loss by regurgitation, and if the obstruction be not too high, this will doubtless be sufficient.

Extreme abdominal tympanites or great extension from gas in the cavity of the abdomen might limit the degree of intestinal distention which we seek to obtain from the effervescence, and militate against a successful operation. If it can be definitely determined that the tympanitis is more abdominal than intestinal, it would, no doubt, be wise to introduce a small aspirating needle, and permit the gas to escape before operating.

I trust that further experience will enable us to obtain some guide by which we can determine at once if the gas has removed the obstruction, and not subject a patient to unnecessary and repeated trials.

A New Journal.—We have just received the first number of a new journal published in Newcastle, New South Wales. It is entitled the *Australian Practitioner*, a Quarterly Journal of Medicine, Surgery, and Sanitary Science, for the Australian Colonies. According to the prospectus, the journal is started to supply a medium for the intercommunication of the observations of colonial practitioners on the causes, progress, and treatment of diseases in that part of the globe, and also to disseminate some apparently much-needed information on sanitary subjects. The number before us contains original articles on scirrhus of the mamma, on four cases of ovariotomy, and on a rare displacement of the heart.

Progress of Medical Science.

NORMAL ACCOUCHEMENT DURING EXTRA-UTERINE PREGNANCY.—The following case, published in the *Révue de Littérature Médicale*, by M. Labatut, interne à l'Hotel-Dieu de Toulon, is of some interest: A woman, thirty-three years of age, was in 1868 delivered of her first child; two years later, 1870, she again showed all the signs of pregnancy. About the ninth month, according to these signs, she had violent pains, but without any result. After this she was sick for six months, when her menses again returned and she regained a state of comparatively good health. The tumor partially subsided and the pains disappeared. In 1875 the catamenia were again suppressed, but this, together with digestive disturbances which showed themselves about the same time, were placed to the credit of the turn of life, the woman being now forty-one years of age. Some months later, however, she was examined by Mme. Rampin, a midwife of Toulon, who diagnosticated a pregnancy in the ninth month; at the same time she perceived a large tumor in the right flank, which, after hearing the history, she attributed to an extra-uterine pregnancy. Fifteen days later the woman was delivered of a living child, and a more careful examination convinced the midwife of the correctness of her diagnosis of the nature of the tumor. In March, 1877, the woman died in the hospital at Toulon of pulmonary tuberculosis. The autopsy revealed in the right tube a mature fœtus, macerated and enclosed in a thick sac. This proved to be, therefore, a tubal pregnancy, dating back seven years, and in spite of its presence there was fecundation and a normal labor.—*Journal de Médecine*, Nov., 1877.

TREATMENT OF GOITRE BY INTERSTITIAL INJECTIONS.—In an article published in the *Annales des maladies du larynx et des oreilles*, M. Cazalis reviews the different modes of treating goitre, and especially the method of Luton. This method, more especially applicable to parenchymatous and fibrous goitres, consists in carrying the iodine to the very heart of the tumor. By this means Dr. Luton has frequently obtained cures in cases rebellious to medical treatment. The ordinary hypodermic syringe is used, but a gilt or nickel-plated one is preferred, and the piston must fit accurately to overcome the resistance the liquid sometimes meets with in the gland. Either the officinal tincture of iodine may be employed, as used by Luton, in doses of one gramme to five grammes, or the ioduretted solution of iodine of Bertin, in doses from fifteen drops to forty drops. The needle of the syringe should be introduced about two to three centimetres, to insure the penetration of the fluid only into the gland. Lévêque advises the unscrewing of the syringe after the introduction of the needle, to ascertain, by the flow of blood, whether or not any important vessel has been entered. The dose of liquid is variable; Luton employed from fifteen drops to four and five grammes. The subsequent symptoms vary with the strength and amount of the solution used. Some solutions, or some small doses, cause only a sensation of uneasiness, or a slight pain in the region of the neck. Stronger injections give rise to pain radiating towards the chin and ears. Occasionally some inflammatory symptoms may be observed, the pulse and temperature rise, the neck swells and becomes tense, but the inflammation usually subsides by the second or third day, and there is felt within the substance of the gland a hard nodule about the size of a pigeon's egg, which contracts little by little and diminishes with the gland. Heller, to reduce the pain and irritation, added fifteen milligrammes of the sulphate of morphia to his injection. Suppuration is rare, but is to be feared if too large an injection, or too caustic a solution has been used, or if the liquid escapes into the surrounding cellular tissue. This method usually gives more rapid results than the medical treatment, but several months are sometimes necessary to obtain these well-defined results. Morell Mackenzie, who has had a large experience of this plan, repeats the injections about every ten days. Luton met with but one case he could not treat by this plan; that was a vascular goitre. Mackenzie, out of seventy-three cases treated in this manner, cured fifty-nine, diminished the size in nine, got no results in three, and two patients gave up treatment.—*Journal de Médecine*, November.

LESIONS OF THE PANCREAS IN CERTAIN FORMS OF DIABETES.—M. Lancereaux presented to the Académie de Médecine, of Paris, some pathological specimens showing lesions of the pancreas taken from subjects dead of diabetes. In remarking on these cases he said: These specimens show that diabetes mellitus is, in some cases at least, accompanied by grave alterations in the pancreas. A similar alteration has been found in many of the recorded cases of diabetes, and in those cases as in ours, the disease, the progress of which has been relatively rapid, and the termination fatal, showed itself by polyphagia, polydipsia, excessive emaciation, abundant glycosuria—in a word, by all the characters of diabetes. On the other hand, the animals in which the pancreas has been extirpated or destroyed become voracious, rapidly emaciate, and soon die. Now, bearing in mind the peculiar characters of the diabetes in those cases of alteration of the pancreas, and the phenomena observed in animals after the destruction of this organ, we believe we can conclude that there exists a causal relation between these grave lesions of the pancreas and the cases of diabetes mellitus in question. This form of diabetes shows itself by a suddenly commencing emaciation, with polydipsia and polyphagia, and the peculiar characters of the alvine dejections. The prognosis of this diabetes will be very grave. The indications for treatment are to forbid substances digested by the pancreatic juice, and to nourish the patient with food digested in the stomach.—*Gazette des Hôpitaux*, Nov. 15, 1877.

A NEW TREATMENT FOR LUMBAR ABSCESS.—Osman Vincent has treated eighteen cases of lumbar abscess by the injection (after evacuation) of sulphurous acid. He selects two cases as examples: the first was cured in two months and ten days, the second in twenty days. The other cases were similarly successful, the only difference being in the amount of pain caused by the injection, which was sometimes severe, but often altogether absent, and in the character of the constitutional disturbance, which was either slight or totally wanting. There was one point upon which he asked the opinion of the meeting; this was, that as a rule, the injection went in colorless and came out black; this was most marked in the cases that succeeded best. He concludes as follows: "The sulphurous acid acts on the pyogenic membrane in such a manner as to prevent the formation of pus, and if strict recumbency is made an essential part of the treatment, there is no reason to fear that this dreaded, but, if taken in time, avoidable complication of angular disease, may, by this treatment, be shorn of much, if not all, its previous destructiveness."—*The Medical Press and Circular*, December 26, 1877.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, February 23, 1878.

THE COMMITMENT OF THE INSANE.

THE case of Miss Dickey has given rise to much comment by the daily press. Furnishing as it does all the elements for a first-class sensation, this is no wonder. In fact, nothing in the shape of a statement can be more startling than the forced confinement of a lady in a lunatic asylum as a patient, when it is proved by a jury that there was an error of diagnosis from the start, and that the said lady was all the time of sound mind. The injustice of the whole proceeding appeals so forcibly to our sense of humanity, that it is difficult to find words which are forcible enough to express our regrets for such an occurrence, or our abhorrence of the possible motives which may have actuated interested parties in bringing about such a result. But in reality the facts of the case do not warrant the conclusions which have been drawn from them. There is certainly cause for much difference of opinion regarding the justice of the jury's verdict. Indeed, there is enough of doubt regarding the sanity of the particular patient in question, to set at rest the fears of any who may believe themselves in danger of being confined in asylums without cause. Still, the case is a suggestive one as bearing upon a system of asylum management which allows the possibility of such occurrences.

Although the facts in this particular case do not by any means prove that the patient was sane, or confined without cause, the bare possibility of a mistake upon such a point invests the whole subject of the diagnosis of insanity with an importance second to nothing in the whole range of our professional duties. Hence, the greater the number of safeguards with which the patient can be surrounded, the better.

Although our present laws regarding the commitment of insane persons are calculated to meet all emergencies, they are nevertheless not perfect. But in allowing this, we must not ignore the fact that such laws have been specially framed with a view of preventing the confinement of sane persons, and of affording them every chance of receiving the full benefit of the doubt.

That Miss Dickey's case is not an exception to the rule in reference to the precautions that are usually taken regarding commitment, is sufficiently proven by the facts as brought out in the examinations before the court. She was examined by perfectly competent men, according to due process of law, and the commitment was made in regular form. She remained under the observation of the medical officers of one of the best-conducted asylums of the country for a period of six years without creating in the minds of these gentlemen any doubt regarding her sanity. This was up to the time of the appointment of a special commission to examine her, the result of which examination has already been stated.

The point in this particular case turned really upon the question, not whether Miss Dickey was of perfectly sound mind, and capable of managing her own affairs, but whether it was necessary that she should be compelled to submit to treatment in a lunatic asylum. When it comes to be settled whether the patient was insane or not, in accordance with the general acceptation of these terms, there is but one answer, and that is almost unqualifiedly against the verdict. When, however, it was to be decided whether or no she should be allowed her liberty under circumstances of doubt created by counsel, the jury naturally and properly strained a point in her favor. This is perfectly right, but the act itself should not be made to prove that there was any dreadful mistake made in committing the patient to the asylum, or of treating her as a patient while she was there.

However, as we have already said, we are anxious that every improvement shall be made upon our present system of committing patients to lunatic asylums as shall prevent even such a supposable case as the one in question. The learned Judge, in his charge to the jury, suggested some improvements in the shape of a trial, similar to the one in question, in all cases of insanity, and within thirty days after their commitment. But, as we understand it, the very process of commitment implies such a right of trial, inasmuch as no person supposed to be insane "shall be held in confinement in any asylum for more than five days, unless within that time such certificate be approved by a judge or justice of a court of record of the county or district in which the alleged lunatic resides, and said judge or justice may institute inquiry and take proofs as to any alleged lunacy before approving or disapproving of such certificate, and said judge or justice may in his discretion call a jury in each case to determine the question of lunacy."—(Laws of New York, Chap. 446, Sec. 1, 1874.)

Doubtless his Honor has in view some more radical measures to reach this end, but it is difficult to see how

the present system can be improved by any regulation establishing a definite trial in each case. With the number of cases which are being daily admitted to our asylums, such a procedure would not only be impracticable, but impossible.

THE SURGEON-GENERAL OF THE NAVY AND HIGHER MEDICAL CULTURE.

WITHOUT entering upon any *résumé* of the tables and other valuable data contained in the report of the Surgeon-General of the Navy for 1877, there are one or two points raised in the introductory text that peculiarly verify and enforce the necessity for a higher standard of medical training, which the faculties of our colleges will find it profitable to ponder at their leisure. After observing that the instruction in hygiene, microscopy, and allied sciences, now considered indispensable to the accomplished physician, is either not given at all, or given very imperfectly, in most of the medical schools in this country, Dr. Grier recommends that assistant-surgeons be ordered, some months previous to their examination for promotion, to the hospital at New York for practical training in these departments.

Indirectly his remarks furnish practical evidence of the fact that a thorough training in the natural sciences, in chemical manipulation, and in microscopy and microchemistry, should, so far from being optional with the student, as they now are, be insisted upon as essential to graduation. While these suggestions have no apparent relation to the necessity for a higher standard of preliminary training, so often urged in these columns, they are really to the point as concerns that question; for, with the great advance in the physical sciences, and particularly in the biological and chemical groups, that has distinguished the last half a century, it is practically impossible to crowd even a summary of them into the conventional three years in a medical college. Of course, a physician need not be an expert in comparative anatomy or microscopy, nor is it essential that he should be able at sight to classify a strange insect, or a newly discovered fossil. But he should, in order to maintain the scientific repute of the profession, know enough of such things to escape the imputation of ignorance; and in the sciences more immediately related to medicine, in botany and chemistry, *e. g.*, his training should be such as to enable him to set about an original research intelligently. The frank statement of the Surgeon-General of deficiencies in the service, due to laxity on the part of our medical schools, ought to encourage the faculties of such schools to take the initiative in a movement that is fast winning its way into general popularity. Any college, initiating a higher standard, and insisting upon a preliminary training equivalent to the degree of A.B., might at the beginning meet with some loss of patronage, but in the end it would become a triumphant success.

The Surgeon-Generals of the army and navy might in one way contribute materially to give popular basis to this movement; and that is by furnishing certain statistical data as to the preliminary training, place where graduated, etc., etc., of rejected and accepted candidates for admission into the service. So far as our observation has gone, graduates who contemplate an examination for the service have to spend some months in special preparation before they feel safe in presenting themselves; and it would stimulate not only the colleges themselves, but the efforts of students, were it once understood that a certain stigma would be fixed upon any institution whose graduates were found conspicuously deficient.

SPREAD OF CONTAGION BY BOOKS.

THE directors of a public library of Kansas have warned the public against the danger of contagion through books, and insist that none such be returned to the library, when used by a person with contagious disease, until said books are properly disinfected. During the prevalence of an extensive epidemic no books are allowed to go out. This is a very important subject which has not received much attention, and suggests many precautions of like character with other articles which pass from hand to hand, notably school-books, paper money, and the like.

Reviews and Notices of Books.

LECTURES ON CLINICAL MEDICINE. By DR. MCCALL ANDERSON. London: Macmillan & Co., 1877.

THIS is a book of 268 pages, divided into seventeen Lectures.

The first is an introductory lecture devoted to the importance of clinical instruction, and to the consideration of the progress made in the field of practical medicine in diagnosis by the aid of the ophthalmoscope, laryngoscope, thermometer, etc., and in therapeutics by cold electricity, the employment of trained nurses, etc.

The other lectures deal with the following subjects: Pain as a symptom of disease; gastric and cerebral vomiting; hysteria; spinal irritation; phenomena of embolism; a case of supposed disease of the pons varolii; treatment of aneurism of the arch of the aorta by galvano-puncture; aneurism of the abdominal aorta; tubercular peritonitis; acute phthisis; mediastinal tumors; the cirrhotic form of Bright's disease; multiple fatty tumors complicated with aneurism; lupus verrucosus; ephidrosis cruenta; elephantiasis arabum. The last lecture deals with the question, "Are the vegetable parasitic affections of the skin due to one or several parasites?"

The book also contains fifteen illustrations. Three of these are temperature charts, and two are reproductions of sphygmographic tracings. Three are uncolored illustrations of the fundus of the eye, one of the normal and the others of the early and of the advanced stage of retinitis albuminurica. These latter it seems might as well have been omitted, for without appropriate coloring they are possessed of very trivial value. The remainder represent an aneurismal sac filled with fibrin, the result of galvano-puncture (poor), a section

of cirrhotic kidney (poor), a section of the retina from the same case, and a leg affected with elephantiasis arabum before and after ligature of the external iliac artery and its fellow.

This sketch will give an idea of the contents of the book. The style is lucid, the words, as a rule, well chosen, and the contents, read with pleasure, can be recollected with profit. The article upon the treatment of aneurism of the arch of the aorta by galvano-puncture, illustrated as it is by a case in which the method recommended by the author of only introducing the positive pole within the sac and making use of six to eight of the zinc carbon cells, resulted in a temporary arrest of the disease, is of considerable interest, and a valuable contribution to the therapeutics of this terrible malady. In the article on embolism he gives as a typical case of cerebral embolism one in which, in addition to the ordinary paralysis arising from a plug in the left middle cerebral, there was an internal strabismus of the left eye, the paralysis of the body being on the right side. An autopsy was obtained, and an embolus found in the left middle cerebral artery, with softening of the outer portion of the corpus striatum, and to some extent of the island of Reil. It is expressly stated that there was no other lesion. The sensation was also considerably impaired. It seems to us that the writer fails in not drawing attention to this marked exception to the ordinary course of events in cerebral embolism in that situation, and in not giving more exactly the limits of a lesion in which sensation was involved to so considerable an extent. No mention is made of the condition of the posterior portion of the internal capsule, etc. This case is followed by a very rare one of cerebral embolism due to hydatids.

His article on the cure of tubercular peritonitis is interesting, but open to the criticism that one of his successful cases was due to typhoid fever and not tubercular peritonitis. The symptoms were pain and fulness in the hypogastric region, tympanitis, high temperature, great emaciation, diarrhœa, and vomiting, and no effusion in the peritoneal cavity. A sister was sick with much the same symptoms as this child was convalescing. It seems extremely probable that the case of Spencer Wells, upon which he relies, may have been one of chronic peritonitis, with granules not of a tubercular nature.

We would also suggest that the first of his cured cases of galloping consumption was one of typhoid fever with bronchitis, and the second, acute broncho-pneumonia, perhaps also complicated with typhoid fever. We base our opinion upon somewhat similar cases which have shown us the liability of mistaking typhoid fever complicated by severe bronchitis or broncho-pneumonia for acute phthisis, and *vice versa*. We think that the author has erred in not pointing out the liability of such mistake in diagnosis when he is asserting his power to cure diseases pretty generally regarded as tending to a fatal termination.

SECOND REPORT OF THE BOARD OF HEALTH OF THE CITY OF NASHVILLE, FOR THE YEAR ENDING JULY 4, 1877.

ASIDE from mortuary statistics and other dismal data, this report embraces a paper on the topography of Nashville in its relation to diseases, supplemented by a report on the water supply of the city, with notes on its climate, contributed by Dr. Ford, of the United States Signal Service, which may be studied with profit as a contribution to the data of a comparatively new aspect of sanitary science, namely, the relation of geological formations to types of disease, to which the eminent Dr. George Derby, of Boston, has recently directed the attention of scientific inquirers in this country. The subject is discussed at some length in the last report of the American Public Health Association, with the resultant confession that the data are as yet too scattered and fragmentary to admit of exact conclusions, but with the consolatory prediction that most important contributions to public medicine are possible in this field. A brief summary of the existing materials will be found in our review of the last volume of the transactions of that body, and a fuller one in the paper of Dr. Harris, cited in that review. The night-soil question has, it seems, become as prominent in Nashville as in our larger cities, although the smaller the town the less difficult its solution, natural facilities being equal. The discussion of this topic, pages 32–38, is neither exhaustive nor abundant in suggestions. But it serves to show that general attention has been attracted to the subject in this country, and that our people are making rapid progress toward an intelligent interest in this passingly important issue of State Medicine. With such indications of a popular sentiment in favor of improved methods of sewerage and drainage, and of avoiding the now almost universal pollution of our rivers, the enlightened sanitary engineer may take courage and venture to hope that the day is near at hand when a scientific treatment of the excreta of cities and towns will be possible. Till then high death-rates must be anticipated. Nashville is, it appears from this report, the only city of 25,000 inhabitants in the United States that is without a public hospital, its only institution of that kind being the property of its ancient University, and not open to the destitute sick.

F. H. HAMILTON. KNOCHENBRÜCHE UND VERRENKUNGEN. Translated into German, from the Fifth American edition, by DR. A. ROSE. Göttingen, 1877.

In translating Dr. Hamilton's work on Fractures and Dislocations, Dr. Rose has paid a deserved tribute to our widely known and esteemed countryman, and has at the same time done a great service to American surgeons in general. Dr. Hamilton embodied in his work, giving full credit to the authors, the reports of numberless cases that might otherwise have been buried forever in the forgotten mass of American medical literature, and Dr. Rose's translation will serve to convince our German brethren that Americans, despite their numerous disadvantages of training and circumstances, have not been idle in the cause of medical progress. This is a fact which Germans in general are only too apt to ignore. The translation has been performed in a careful and conscientious spirit, and in point of accuracy far surpasses the majority of English translations of German medical works. In comparing the German version with the original, we have found but very few places in which the translator failed to keep closely to the text, and even in these places the changes are so slight and unimportant that they do not at all diminish the value of his work. The illustrations are exact copies of the originals, so exact, in fact, that we believe they must have been made from the same woodcuts. Only one of the 344 illustrations in the English copy has been left out by the translator.

FOURTH BIENNIAL REPORT OF THE STATE BOARD OF HEALTH OF CALIFORNIA, FOR THE YEARS 1876 AND 1877.

ALTHOUGH very brief as compared with our own reports, or with those of the State Board of Health, Mass., this pamphlet of 100 pages contains a couple

of papers of high value to the medical profession at large, in addition to the usual facts of purely local interest. One of these is a carefully prepared statistical report by the Secretary of the Board, on the Relations of the Climate of California to Consumption, which, with an alteration of names, will be found applicable to our own longitude; the other, a practical statement by Dr. J. F. Montgomery, of Sacramento, as to the adulteration of food, drink, and drugs, the facts of which are of scarcely less interest to New York than to California practitioners. The report of the secretary embraces an apparently very exact survey of the vital statistics of California for the last two years, with pretty full notes upon recent outbreaks of diphtheria, a statistically arranged survey of the prevalence of consumption in the State, and a compendious series of memoranda on malarial diseases, edited from the communications of medical correspondents in each county. A better and more striking witness to the value in sanitary science of State Boards of Health, with their larger and more comprehensive schemes of inquiry, could not well be adduced than is presented by this rapid survey of the diseases of a whole State, and the memoranda of local causes accompanying it. Excellent as the reports of our metropolitan board are, their efficiency as sanitary documents would be vastly augmented by the supplementary work of a general survey and comparison of sanitary data such as are here illustrated.

HOSPITALS: THEIR HISTORY, ORGANIZATION, AND CONSTRUCTION. By W. GILL WYLIE, M.D. D. Appleton & Co., New York, 1877.

THIS book is a reprint of the Boylston Prize Essay for 1876. It commences with a chapter on the history of the origin and development of hospitals, followed by one on the relations of hospitals to pauperism. The latter chapter deals with some of the bad results of indiscriminate charity, and gives a classification of hospitals. The third chapter relating to the organization and management of hospitals, considers "the Board of Managers and Medical Boards," "the Value of Hospital Appointments," "the Influence of Women in Hospitals," and "the Superintendent." The five following chapters are devoted to the construction, furnishing, and general arrangement of hospitals. The ninth chapter contains the writer's views on the relations of a medical school and training school for nurses to a hospital. The tenth chapter is taken up with a brief consideration of "The Improvement of Hospitals now in Use," "Small Hospitals," "Lying-in Hospitals," "Hospitals for Convalescents," "Army Hospitals," and "Insane Asylums." The eleventh and last chapter relates to hospitals now in use, which the writer considers under five heads, viz.: The old Conglomerate, the old Block plan, the Corridor plan, the Pavilion system, and the One-Story Pavilion plan.

The book is well written, and contains a good deal of useful information.

THE SCIENCE AND ART OF SURGERY: Being a Treatise on Surgical Injuries, Diseases, and Operations. By JOHN ERIC ERICHSEN, F.R.S., F.R.C.S., Surgeon Extraordinary to her Majesty the Queen, etc. Revised by author from the seventh and enlarged English edition. In two vols., 8vo. Philadelphia: H. C. Lea, 1878.

FOR the past twenty years Erichsen's Surgery has maintained its place as the leading text-book, not only in Great Britain, but in this country. That it is able to hold its ground is abundantly proven by the thoroughness with which the present edition has been revised, and by the large amount of valuable material that has been added. Aside from this, one hundred and fifty new illustrations have been inserted, including quite a number of microscopical appearances of pathological processes. So marked is this change for the better that the work almost appears as an entirely new one. To such as may be in the commencement of their studies and may hear for the first time of the work before us, we would give some idea of its scope in the words of its author: "Throughout the work it has been the object of its author to place before the student and practitioner the science and the art of surgery, not as consisting merely in the observation of such injuries, diseases, and malformations as are met with in surgical practice, or in the dexterous application of manual or operative means for their relief, but as demanding an exercise of general medical knowledge and thorough acquaintance with all those conditions, whether intrinsic to the patient, or surrounding him, that favor or prevent his restoration to health." And again: "In every instance an endeavor has been made to give as full and clear a description of symptoms, pathology, diagnosis, and treatment as the importance of each demands and the present state of surgical knowledge admits."

In conclusion, we repeat the general verdict of practical surgeons, that it is one of the best works of its kind in any language.

Reports of Societies.

NEW YORK PATHOLOGICAL SOCIETY.

Stated Meeting, January 9, 1878.

DR. E. G. JANEWAY, PRESIDENT, IN THE CHAIR.

THROMBOSIS OF THE OVARIAN VEIN—PYÆMIA.

DR. JANEWAY exhibited a specimen of thrombosis of the ovarian vein, with the following history: Bridget Shea, æt. 40 years, admitted to Bellevue Hospital, November 27, 1877. The patient was a married woman with a good family and personal history. On the 9th of November the patient was delivered of a child at full term. The labor was natural, though she stated that she had a chill the night previous, and that her knees became painful and swollen on the 11th of November. On the 26th she had two chills, followed by profuse sweating. When admitted on the 27th she was found to be of stout build, with a small abscess over left wrist, and swelling and great tenderness of each knee. The tongue was dry, brown, and tremulous, the teeth covered with sordes, and the heart, lungs, and abdominal organs normal, save some enlargement of the spleen. Pulse 118; temp. 104½° F. She had had two chills just previous to admission, each followed by perspiration, and later she had a third in the hospital. The abscess over the left wrist was opened the next day, and on the succeeding day a hypodermic syringe was used for exploring the right knee, which was the more swollen and tender of the two. No pus was obtained by the use of this instrument. Her breath had a marked sweetish odor, the temperature was somewhat irregular, but, as a rule, low in the morning and high in the evening, except on the two days preceding death, when it ranged steadily between 103° and 104°. A delirium occurred on the night of the 5th, and on the morning of the 6th of December, she died at about 4 A.M. The symptoms did not change much, save the addition of vom-

iting five days before death, but ceasing on the use of nutritive enemata three days before death, and the supervention of some tympanitic distention of the abdomen on the 3d of December.

A vaginal examination made shortly after the admission of this patient by my house-physician, gave no evidence of disease of the uterus. I examined her with negative results as regards a direct cause, which I could satisfy myself was the cause of the pyæmia which the clinical history made manifest. In the absence of a marked lesion I came to the conclusion that in all probability the cause of the pyæmia was to be found in a thrombosis of the ovarian vein, due probably to some local process in its neighborhood of which we did not obtain evidence; and I gave a clinical lecture upon her as illustrative of this condition on the 4th of December.

The post-mortem examination showed the following conditions: The right knee-joint contained a small amount of thick pus. The left, however, did not give exit to any on incision of small size. The heart was normal. The lungs were œdematous, and there were two lobular inflammations in the lower lobe of the right lung. The pleura covering one of these was raised by a thin, sero-purulent effusion. The branch of the pulmonary artery leading to these contained a plug which in the portion towards the periphery was soft and puriform, but towards the centre was firm, reddish-gray, adherent. The soft portion was evidently an embolus; the firm, a secondary thrombus. The soft puriform matter consisted of granular fibrin, short fibrillæ, some few granular leucocytes, numerous fine granules, and rod-shaped moving bacteria. The liver showed no evidence of disease. The spleen was enlarged and softened. The uterus was about three inches long, and its inner surface was coated with a thick, tenacious layer of fibrin and pus, easily removed. But it showed no evidence of inflammation of its walls. The right ovary contained a small abscess about the size of a marble. There was also a sac between the vagina and rectum of about the same size, communicating with the vagina by a pin-point opening. From this there could be traced upwards an inflammation of the cellular tissue of small width. This higher up involved the radicles of the ovarian vein of the right side leading to a periphlebitis. The right ovarian vein had its coats thickened, was adherent to the periphery, was considerably enlarged, and contained a soft puriform thrombus. The vena cava contained a peripheral thrombus on the right side of about one-sixteenth of an inch in thickness, commencing at the opening of the right ovarian vein. The left ovarian vein was healthy.

THROMBOSIS OF THE FEMORAL AND ILIAC VEINS IN A CASE OF PHLEGMASIA DOLENS—PYÆMIA.

Dr. Janeway presented a second specimen, which consisted of thrombosis of the femoral and iliac veins.

Mary G——; married; 25 years of age; Irish; was admitted to Bellevue Hospital, December 15, 1877. The patient gave a good family and personal history. She had been free from syphilis and intemperance. She had had two natural labors; no miscarriages. During her first pregnancy, the legs were œdematous, but the swelling subsided after confinement. She was confined two months before admission to the hospital, but at the end of four got up, worked, and walked, and afterwards flooded for a week at times. At the end of the week, her left leg began to swell and grow painful. The secretion of milk ceased. One or two weeks later the right leg became affected in a similar manner.

On admission, the patient was possessed of considerable flesh; was weak, and markedly anæmic. Her lungs were normal. The heart was of normal size, but a soft, blowing murmur, systolic in rhythm, was audible at both apex and base, and produced independently of each other. There was a murmur in the arteries of the neck, and venous hum. Urine was pale, acid, of specific gravity 1018, and contained albumen and casts. Both lower limbs were swollen, œdematous, tender, and painful; the right being the more affected. The swelling prevented a full examination of the femoral vein, but at first no cord-like feel could be detected. Thermometer, 103¼° F. By the 20th of December the pain in the right limb became increased, whilst that of the left was nearly gone, and at the same time a slight induration could be felt in the course of the femoral vein, near the saphenous opening on the right side, and slight erythema was manifest just above Poupart's ligament.

December 24th.—As a result of resting the limb on a double inclined plane, and wrapping it in oil silk and cotton batting, after inunction with ung. stramonii, marked relief from pain was experienced since the previous note. At this time induration could be made out in the course of the external iliac vein, and the erythema above Poupart's ligament became more marked, and the tenderness much severer.

On the 25th of December, the tongue became brown and dry, the breath sweet, and profuse diarrhœa occurred. From this date to the 29th, she continued in much the same state, but at this latter date an induration, due to thrombosis, could be distinctly traced in the course of the superficial epigastric vein, and the induration in the right groin became more marked. The patient from this date became weaker; the diarrhœa, somewhat less marked, continued, and on the 1st of January, 1878, she died, œdema of the lung developing previous to death. I made a vaginal examination on several occasions in this case, but could discover no evidence of disease of the uterus, vagina, or of their surroundings. It was easy to make out a thrombosis of the veins, external iliac and femoral, but the cause was not so easily decided upon. I was in doubt, owing to the induration and redness in the course of the external iliac and upper portion of the femoral, whether the thrombosis of these vessels was due to a local inflammation in this region, or depended upon weakness.

The temperature record averaged from 100–102°.

The autopsy, on the 3d, showed the following: The pericardium contained about two ounces of serous fluid, without the least trace of inflammatory exudation. The heart was of normal size; the valves normal, but the muscular fibres were the seat of marked fatty degeneration in the interior, less marked towards the exterior. The left pleural sac contained somewhat over a pint of serous fluid. The left lung was somewhat œdematous and congested. The upper lobe of right lung contained two gangrenous infarctions. The larger was about one and one-half inches in transverse measurement, seated at the periphery, about the middle of the interlobar fissure. This spot consisted of a central core of dead lung-tissue, around which suppuration existed, which had in many places detached it from the surrounding lung, in which an indurative inflammation was progressing. The other was smaller, less advanced in the process of separation, and seated towards the centre. In the lower lobe, many of the branches of the pulmonary artery were the seat of an extended thrombosis. The thrombus possessed adhesion to the wall, was reddish-gray, firm, and uniform in its structure. This throm-

bus began in one of the large branches, and extended thence to the periphery. There were a few points of catarrhal pneumonia in this lower lobe, but no hemorrhagic infarctions. The lobe was somewhat congested, and a little frothy serum escaped on section.

Veins.—The vena cava ascendens, common iliacs, external iliacs, femoral of the right, and probably of the left, were the seat of a thrombosis.

I regret that, as the friends were to bury the body, a careful dissection of the veins of both legs was impossible. A thrombus projected from the left common iliac vein into the vena cava, occupying about one-third of the calibre of this vessel, and terminating by a tapering extremity an inch above the opening of the right ovarian vein. The left, common, and external iliacs were almost occluded by the thrombus—a small channel, capable of admitting a pin, existing at the upper part. The right common iliac contained a thrombus which was only partially obstructing, and existed on the upper half of the wall. The external iliac was completely occluded, and the thrombus extended in the femoral as low as the point where I divided it in Hunter's canal. The thrombus in the femoral was more recent than that in the external iliac. The superficial epigastric vein contained a firm thrombus, but the internal saphenous was only thrombosed by a recent thrombus near its entrance into femoral. The tissues around the vein were thickened and closely adherent to the vein, rendering the dissection difficult, and the walls of the veins are somewhat thickened. There was also a little abscess the size of a small marble, in the right inguinal region above the vein. The uterus was normal, as was the vagina, broad ligaments, ovaries, etc. The uterine and ovarian veins were permeable, and were not thrombosed. The ovarian veins, of the right side especially, were larger than usual, and I suppose, through their communication with the internal iliacs by the uterine, must have helped to carry on the circulation from the lower extremities. The abscess and the periphlebitis were, I think, secondary to the thrombosis, which was probably due to weakness. The liver was somewhat enlarged, had a fairly-sharp border, and was the seat of marked fatty change in the liver-cells. The spleen was not much altered in size; a little increased in thickness. The kidneys presented, as the liver, marked fatty change. This existed in the epithelium of the tubes, and in the Malpighian bodies. There were also casts in some of the tubes. The phenomena of the case were, then: Hemorrhage post-partum; thrombosis of veins mentioned, from resulting weakness of circulation, the fatty degeneration of heart, perhaps, aiding thereto; periphlebitis resulting from thrombosis *embolism* in right upper lobe leading to gangrenous infarction; thrombosis of pulmonary artery in lower lobe; a systolic murmur heard during life at both apex and base, not due to an organic lesion, but to anæmia; degeneration, fatty, of heart, liver, and kidneys.

TRACHEOTOMY IN LARYNGEAL DISEASE—WHEN AND WHY IT SHOULD BE PERFORMED.

Dr. J. H. Ripley exhibited a patient upon whom he had performed tracheotomy for laryngeal disease, and gave the history as follows:

E. F. F——, 25 years old, married, born in the U. S., a resident of Plainfield, N. J., and by occupation a grocer. His grandparents died of old age. His parents are living, and in good health. He is the eldest of a family of eleven children. Of these, two were still-born, and five died of eruptive fevers in early childhood. A sister died of consumption at the age of 20 years. A brother and sister, aged respectively 19 and 23, are in good health. The patient's first illness was a prolonged attack of chills and fever, when 2½ years old. Several years ago he contracted a gonorrhœa, which lasted six months. Otherwise he had always been healthy. His habits have been regular, except that he occasionally indulged to excess in alcoholic liquors. Eighteen months ago he began to suffer from cough, which, however, did not prevent him from attending to his duties, and from which he fully recovered in about two months. Three months later he was again seized with cough, which has continued to the present time. Nine months since, he began to be troubled with hoarseness, which has been gradually getting worse. His general health, too, has steadily declined, his strength and appetite have failed, and he has had night-sweats. Of late he has experienced pain in swallowing, especially hot drinks, which also had a tendency to excite severe paroxysms of coughing, during which he often vomited his meals. He has had no hæmoptysis. Two months ago he entirely lost his voice, and has not since been able to speak above a whisper. Difficult respiration was soon added to the aphonia, and has been getting so much worse within the last few weeks as to frequently awaken him at night with a sense of impending suffocation. Dec. 22d, after slight exertion, he felt nauseated, and tried to vomit, but unsuccessfully. Great dyspnœa followed, and he fell to the floor unconscious. He was soon restored, when respiration became comparatively easy. The following day he was brought to St. Francis' Hospital by his physician, Dr. Chas. F. Stillman, our house-surgeon. His condition on admission was critical. The breathing was labored and stridulous, the face dusky, and the pulse frequent and feeble. After allowing him a few minutes' rest, we gave him an ounce of brandy, and then proceeded to perform tracheotomy, Dr. Stillman assisting. Chloroform was very cautiously administered, and at first he seemed to bear it well; the breathing became easier, and consciousness was soon lost. But I had hardly completed my first incision, before Dr. Hathaway, who was giving the anæsthetic, called my attention to the absence of the left radial pulse. I examined that of the right arm, which I found perceptible, but very feeble. The chloroform was withheld, and the operation rapidly proceeded with. Soon the pulse became stronger and chloroform was again administered, as the patient began to struggle. No other accident happened; the hemorrhage was inconsiderable, and he was soon breathing easily through the canula. The relief following the operation has been very gratifying. His breathing is now free, his appetite has much improved, and his cough greatly moderated. When the tube is removed, and the external wound closed, he can speak with almost natural clearness, and there is less dysphagia.

Dr. Elsberg examined the larynx six hours after the operation, and dictated the following: "I find the soft parts at the entrance of the larynx much hypertrophied, and the whole interior filled with swollen, infiltrated tissue; the aryteno-epiglottidean folds form great cushions, which meet in the median line. In my opinion, this condition would have proved rapidly fatal without tracheotomy." Before the operation, it was, for obvious reasons, impossible to obtain any very accurate knowledge of the condition of the lungs. Subsequently a physical examination revealed a large cavity in the left lung, with consolidation of right apex.

The urine was repeatedly examined, with negative

results. Heart, liver, and spleen were believed to be normal. Dr. Elsberg re-examined the larynx yesterday (Jan. 8). He said: "The swelling and infiltration of the parts have mostly disappeared; the mucous membrane is pale, and the superficial vessels enlarged." It would seem from the foregoing facts that tracheotomy has, in this case, accomplished these results: 1. It has relieved symptoms. 2. It has prolonged life. 3. So far as the larynx is concerned, it has proved curative.

Dr. Briddon asked the question, if the laryngeal disease in this case was the result of tuberculosis.

Dr. Elsberg answered that it was not due directly to tuberculous disease.

Dr. Robinson remarked, that in connection with this case, the question which had been asked at a previous meeting, how far tracheotomy can be of service in these cases, came up for consideration.

Dr. Ripley did not understand that the disease in such a case was susceptible of cure any further than the larynx was concerned.

Dr. Van Geisen stated that he had a somewhat similar case of dyspnœa, upon which he intended to perform tracheotomy, but the previous use of inhalations of steam and lime-water rendered the operation unnecessary. He made the examination of the larynx during the intervals of the distressing dyspnœa, and found that there was a breathing space somewhat less than the diameter of a quill. In the course of three hours afterwards, under the influence of the steam inhalation, the orifice became much larger, and the next morning the patient was relieved of his acute œdema. There was, however, no tuberculous element in that case.

Dr. Ripley did not think that the two cases were parallel ones. In his case the operation was absolutely necessary to save life.

Dr. Elsberg confirmed the latter statement, and stated that all the distressing symptoms of laryngeal trouble entirely passed away within two weeks after the operation.

Dr. Van Geisen asked if tracheotomy in these cases conferred any permanent benefit upon tuberculous patients.

Dr. Ripley remarked that some cases of tuberculous laryngitis partook of an ulcerative character, while in others the inflammatory element predominated. If the latter condition can be controlled by steam, the effect would be only temporary, and the condition would be liable to recur at any time thereafter. His patient's larynx had been becoming more and more closed for several months, and he believed that the only thing that would relieve a larynx under those circumstances was rest, and the only way to give it rest was by making an opening below it.

Dr. Van Geisen asked if such was not an unusual form of inflammatory action in tuberculous laryngitis.

Dr. Elsberg replied that such cases were not very unusual. The question whether steam would relieve infiltration in cases of inflammatory obstructive laryngeal disease depended upon the depth of the tissues involved. When the mucous membrane merely was involved, steam was indicated; but when the inflammatory processes extended deeper, the original obstruction was apt to be increased, and death produced. In this connection he referred to a case of a practitioner of this city, illustrating the latter point, and in which death occurred within an hour after the inhalations were commenced. He thought it extremely important to diagnosticate between the two conditions of superficial mucous engorgement, and submucous infiltration before relying upon the steam inhalations.

Dr. Janeway asked Dr. Elsberg how frequently he had seen tracheotomy performed in laryngeal phthisis.

Dr. Elsberg replied that personally he had seen but five or six cases; but the operation had been done by other practitioners in accordance with his advice probably twenty times.

Dr. Janeway asked what were the results.

Dr. Elsberg replied that, as far as the immediate condition was concerned, the results were satisfactory, although of course it could not be expected to have any tendency to arrest the progress of the pulmonary disease. The only indication for the operation was, as in Dr. Ripley's case, impending death from suffocation.

Dr. Briddon stated that, according to his experience, œdema very rarely occurred in ulcerative disease of the larynx. He thought, however, that such ulcerative diseases were benefited by the rest which tracheotomy could give them.

Dr. Ripley referred to a case in his practice similar to the one related by Dr. Van Geisen, and in which he used steam very persistently for several days, but without benefit. He then consulted with Dr. Elsberg, who advised tracheotomy. The operation was performed accordingly, with the result of giving the patient immediate and permanent relief from all his distressing symptoms of dyspnœa.

Dr. Janeway said the question was, in what proportion of cases of laryngitis due to phthisis is tracheotomy advisable.

Dr. Elsberg replied that the proportion of cases was very small.

Correspondence.

THE TREATMENT OF DIPHTHERIA.

To the Editor of The Medical Record.

Dear Sir:—I regard it as on the whole flattering to the merits of the treatment of diphtheria which I had the honor of outlining in your columns on January 12th last, that the credit of having previously presented one in some respects "similar" is claimed by Dr. Rodman in behalf of one author, and that of originating one "essentially precisely" identical by Dr. Mundé in behalf of another, in your issue of February 16th.

I will first reply briefly to Dr. Rodman.

The question whether various combinations of drugs are equally "simple, pleasant, harmless, and efficacious," is one to be settled only by actual experience. The importance of *details* is generally recognized both in medicine and surgery.

The doctor says I use almost the "identical spray" mentioned in the other article to which he refers (*Am. Journal Med. Sciences*, October, 1877). Now, as that "almost identical spray" was first mentioned, so far as I know, in my article (Transactions of the New York Academy of Medicine) read March, 1876, it is evident that it was not I that was the borrower.

Again, in the very important point of the treatment of nasal implication, on the proper performance of which many lives depend, there is a great difference in the two methods referred to. Which is the better can be settled only by general experience. With such

undeniable and important differences as this, and those which Dr. Rodman has himself acknowledged, it will probably not be thought strange that I protested against the doctor's inadvertent identification of the two methods. Let each stand on its own merits. I conclude my reply to Dr. Rodman by thanking him for his courtesy and candor.

But it appears that my treatment of diphtheria is not only "backed like a camel," but "very like a whale."

I am charged by Dr. Mundé with two things: first, adopting my treatment from Dr. Jacobi's "Contributions," etc.; second, failing to make any acknowledgment for it. Bad enough!

On page 290 of the Transactions of the Academy of Medicine for 1876, or page 7 of my reprinted pamphlet, is the following foot-note: "There is, in my opinion, more essential and valuable truth in this little monograph (Dr. Jacobi's) than can be easily found elsewhere. It should be carefully perused by all students of this much-perplexed subject. It is proper to add, that while I coincide with Prof. Jacobi's views in almost every particular, I am not his 'follower,' except in the order of publication. My own pathological conclusions and my present mode of treatment were independently arrived at (as many of my friends know) before his paper was written or I knew anything of its author's views."

Having for nearly two years before used a variety of similar combinations, given at short intervals, I was in November, 1874, using the very formulæ which I have since published, as is shown by the following:

"My Dear Doctor:—The iron and glycerine mixture, the formula of which you have since published, and the chlorate of potassa, and also the spray of carbolic acid and lime-water, were used by you at half-hour intervals with favorable result in the treatment of my oldest son, who was attacked with diphtheria immediately after the death of two others of my children, November 15, 1874. From that time forth I used this treatment in my practice with the excellent results stated in your first paper.

"E. J. Darken,
"*House Physician of Demilt Dispensary.*"

Now, as Dr. Jacobi's paper was read December 28th *following*, it is sufficiently evident how erroneous is the assertion that I merely formulated what had been suggested to me by it.

With regard to the employment of alcoholic stimulants I must differ from Drs. Rodman and Mundé, in believing that their routine employment in diphtheria is very general in the profession, and their use in bad cases well-nigh universal. Believing that great harm results therefrom more often than good, I protest against the distinctive feature of my treatment which relates to them being ignored or pronounced trivial.

Finally, while I decline to "stand and deliver" to Dr. Jacobi the credit of that for which I am in no way indebted to him—a system of treatment which was the result of much individual anxious thought and hard-earned experience—I am happy to add that I consider his "Contributions to the Pathology and Therapeutics of Diphtheria" as of great excellence and value, and that its perusal afforded me delight and instruction.

Very respectfully,

C. E. Billington.

157 Lexington Avenue.

PROPRIETARY MEDICINES.

Dr. Geo. Bayles, of this city, has favored us with a lengthy letter in reply to Dr. E. R. Squibb, in the last number of this journal. Our desire to give him an opportunity for a prompt hearing, and our inability to publish the letter entire, must be our excuse for merely making the following extract bearing upon the question of fact:

. . . . . .

"I have explained to the profession how I came to use a certain pharmaceutical preparation, and in my paper I addressed the profession concerning its ascertained merits as a medicine, let it be prepared by one chemist or another, as its known formula makes it possible so to be. The drug referred to is *not a patent medicine*, neither is it a *proprietary medicine* in the sense of any secret belonging to its composition and mode of manufacture. Nothing hinders the trade at large from making it, if it has a merit that will guarantee a paying sale. If it might be as generally manufactured as it is generally sold, it would cease to have any suspicion attached to it of being proprietary, and it might be so manufactured as far as any known difficulties are concerned. Dr. Squibb can do it and possibly improve upon it.

"To use a medicine of known formula, and prove it to be of veritable value, and not to mention the source from which it was obtained, as a means of its identification, would be an affectation of sensitiveness, and all scruples of that kind ought to prevail before the medicine is tested. After the use of it, any concealment would be in an appreciable degree dishonest. Let us have disapproval and opposition tempered with generosity and common sense, and let us not stretch a good thing beyond its power of recovery to a state of healthy or normal tension.

"But with this expression of views I do not claim it to be as anything said in extenuation of unethical advertising. I repudiate, with all the force of a direct denial (in which, I believe, I am sustained by a good and reliable conscience, and a character for truthfulness), any supposed or intentional aid to the manufacture of the drug in question."

RECTAL ALIMENTATION.

To the Editor of The Medical Record.

Sir:—Two or three articles on Rectal Alimentation, published recently in the Record, induce me to give to your readers the outline of a case which came under my treatment a few months ago, in which this mode of introducing nourishment into the system was attended with encouraging results. I was called to attend Mrs. M——, æt. 35, of very feeble constitution. August 27, 1877. Her symptoms indicated *ulcer of the stomach*, a diagnosis which was concurred in by other physicians who saw the case. A profuse and persistent vomiting was the most distressing symptom. Nothing whatever would remain in her stomach. The mildest nourishment, as well as medicines, would excite vomiting almost immediately after their introduction. About one week after my first visit I resorted to rectal alimentation, which was continued until her death, which occurred October 18th. During this period no food whatever was administered by the stomach. Although my patient finally succumbed, her death was due to the effects of the gastric disorder, and *not from inanition*. Indeed, from the time

I commenced the rectal injections of nourishment her condition improved, and her strength remained remarkably good until two or three days before her death, when she began to sink. I usually ordered the injection of a pint of beef-tea, or chicken broth, to which I directed to be added a teaspoonful of brandy; this to be used lukewarm, and injected slowly.

I had the satisfaction of keeping my patient alive for a period of over six weeks by rectal alimentation alone; during this period no food or medicine entered her stomach, except a little water drank daily.

It may be interesting, in this connection, to state that even after discontinuing alimentation *per orem*, and after employing all the remedies suggested by the experience of myself and others to counteract it, a persistent and very distressing vomiting threatened to carry my patient off by sheer exhaustion. At this stage, the idea suggested itself that, as the hydrate of chloral had been found to exert a curative tendency on external ulcers, why not internal as well? I at once discarded the use of all other medicaments except the hypodermic administration of morphia daily, and gave two-grain doses of the chloral in solution every four hours. The effect astonished me, prepared as I was and hoping for a favorable result. *After taking the first dose of chloral my patient vomited but twice during the time intervening until her death*, a period of between five and six weeks. From a condition of almost incessant vomiting she passed at once, as if by magic, into a state of almost entire freedom from this previously excessively distressing symptom; and although the strictly *curative* properties of chloral failed in this instance, yet it *did* effect an influence which can be called an important step in that direction. At all events, if we have in the hydrate of chloral a remedy with which we can control the persistent and exhausting vomiting which almost invariably attends ulcer of the stomach, we are in possession of a means by which to combat one of the most distressing symptoms of the disease; and although I am aware that more extended experience is required to establish the efficacy of this drug in the treatment of the disease mentioned, yet the remarkable results attending its use in this one case, entitle it, in my opinion, to more extended trial at the hands of the profession.

J. O. DAVIS, M.D.

QUAKER SPRINGS, N. Y., Feb. 7, 1878.

Medical Items and News.

CONTAGIOUS DISEASES — WEEKLY STATEMENT.—Comparative statement of cases of Contagious Diseases reported to the Sanitary Bureau, Health Department, for the two weeks ending February 16, 1878.

Week Ending	Typhus Fever.	Typhoid Fever.	Scarlet Fever.	Cerebro-spinal Meningitis.	Measles.	Diphtheria.	Small-pox.
Feb. 9, 1878....	0	11	80	6	99	73	0
Feb. 16, 1878....	0	4	86	4	*171	84	0

THE ANNUAL DINNER OF THE ALUMNI ASSOCIATION OF THE COLLEGE OF PHYSICIANS AND SURGEONS will be held at Delmonico's, on Wednesday, March 6th, at 6.30 P.M.

* 35 cases of measles were reported as occurring in the Juvenile Asylum, 157th Street.

HEALTH OF ROWING MEN.—Dr. E. H. Bradford has collected and analyzed the histories of all the graduates of Harvard College who engaged in the intercollegiate regattas up to the year 1870, to ascertain if possible what effect their training had upon them. His conclusions coincided with those of Dr. Morgan, who performed a similar work for the oarsmen of Oxford and Cambridge, and are opposed to the opinions commonly held by the community and a large number of professional men. The injurious effects usually attributed to such great physical exertions are:

1st. Severe exhaustion after a race.

2d. Disturbance caused by the change from training to ordinary life.

3d. Consumption, emphysema.

4th. Heart disease.

5th. Nervous debility.

Dr. Morgan could find no instance of the first in all the Oxford and Cambridge races, and none have occurred among the Harvard and Yale men. In "scrub races" men have sometimes "given out," but these races are rowed without training.

One Harvard man complains that the change back to his ordinary mode of life brought on an attack of typhoid fever.

Dr. Morgan found 17 per cent. of the deaths among English oarsmen due to consumption. The report of the Registrar-General showed 28.9 per cent. of the deaths of males during the same years to be from this cause. Among the Harvard men Dr. Bradford found the percentage high; nearly six per cent. of the cases analyzed were consumptive. No facts in regard to emphysema have been obtained.

Dr. Morgan found four cases of heart disease among 294 men. Dr. Bradford's inquiries have not been sufficiently thorough to justify any conclusions.

Dr. Morgan found no cases of constitutional injury showing itself late in life. Dr. Bradford finds one man who attributes his ill health partly to over-exertion at the oar, but the connection between the disease and the alleged cause is rather obscure.

The majority of the rowing men consider themselves permanently improved—many not at all injured, and but a small number as positively injured.—*The Sanitarian*, November.

CALCULUS IN THE SUBLINGUAL DUCT.—Dr. F. D. Lamb, of Great Bend Village, Pa., reports a case of the above occurring in a young man, aged 26 years. It appeared as a suppurating swelling under the tongue, which discharged pus and disclosed a white and hard substance through the opening. The latter was enlarged, and the calculus, one-fourth of an inch in length, one-tenth of an inch in diameter, and weighing six grains, was removed.

DEATH OF PROFESSOR CLAUDE BERNARD, OF PARIS, FRANCE.—The death of this distinguished physiologist is announced in Paris. He was born in France July 12, 1813, and was therefore, at the time of his death, in his sixty-fifth year. For twenty-three years, and until death, he was Professor of Experimental Physiology in the College of France.

DIPHTHERIA IN BOSTON.—There is an alarming prevalence of diphtheria in the portion of Boston known as "Back Bay," due to a fault in the main sewer.

NEW YORK OPHTHALMOLOGICAL SOCIETY.—At the annual meeting of the New York Ophthalmological Society, the following officers were elected for the year 1878:

President, Dr. H. C. Eno; Vice-President, Dr. C. S. Bull; Secretary and Treasurer, Dr. G. R. Cutter;

Committee on Admissions, Drs. J. D. Rushmore, E. Curtis, E. G. Loring.

SIMPLE MODE OF RELIEF FOR FOREIGN BODIES IN THE THROAT.—A British naval surgeon, Dr. Beveridge, states that for foreign bodies in the throat, such as a piece of meat, etc., a simple mode of relief is to blow forcibly into the ear. This excites powerful reflex action, during which the foreign body is expelled from the trachea. The plan is so easy of execution that, if there is anything in it, it ought to be generally known and applied.—*Canada Medical Record.*

MEDICAL JOURNALS IN MICHIGAN.—With the commencement of the year we have two new medical journals making their appearance in Michigan, and from one city, Detroit. The *Detroit Lancet* is a monthly, octavo size, with eighty-two pages of reading matter, and is edited by Drs. H. A. Cleland and Leartus Connor. The first number is a creditable one, and is filled with very interesting and edifying reading.

The Michigan Medical News is a semi-monthly, and is edited by Dr. J. J. Mulheron, assisted by a corps of associates in different parts of the State. The present number is devoted principally to short abstracts of news and progress of medical science, and presents a great deal of useful and practical information in a small space. The number also contains two original articles, and an editorial in which the usual reasons for projecting a journal are given.

Both periodicals claim to be non-partisan, both are under the guidance of able journalists, and we hope both will succeed to the full measure of their respective anticipations. At least it will not be the fault of the respective managers if such is not the case.

ITEMIZING MEDICAL BILLS.—A recent number of the *London Lancet* contains some remarks upon this subject, bearing upon a discussion in the *Times* regarding physicians' bills. To certain persons who "want to have the obligations of patients to their doctors expressed in so many items, so many visits, so many bottles of medicine, so many pills, so many looks at the tongue, so many feelings of the pulse, so many uses of the clinical thermometer," it says, "the idea of specifying terms is impracticable. The old bills of doctors are fit only for antiquarian museums, and the items elaborately specified in them are never likely to be seen again. Roughly, every patient is entitled to know the principles on which he is charged. But there is a discretion in medical charging, inevitable in the very nature of things, which is fatal to the item system. It is not only that good medical men are conscious of rendering services for which they ask payment, but which it would not be edifying or even possible to express in items, but that this discretion takes the form of ingeniously reducing the amount of a bill when this seems disproportionate to the means of the patient."

COMMENCEMENT OF UNIVERSITY MEDICAL COLLEGE.—The thirty-seventh annual commencement of the Medical Department of the University of the City of New York was held on the evening of February 19th, at the Academy of Music. After a brief prayer Chancellor Crosby conferred the degree of Doctor of Medicine upon one hundred and fifty-three graduates.

Post-graduate certificates were conferred on Charles Dewey Pearson, M.D., and William Childs Tyree, M.D.

Honorable mention for proficiency and superior excellence, as shown in their examinations, was made of the following gentlemen: David Franklin, E. B. Ramsdell, Henry Levy, W. M. Gibson, Edward D. Fisher, G. C. F. Williams, George H. Felton, F. D. Bagley, F. S. Gould; Paul Ehrhart, E. D. Fuller, A. A. Dean, Dryden Johnson, W. C. Brownson, G. A. Macdonald, H. H. Hunkle, C. E. Quimby, Irwin Simpson, B. A. Church, Robert Milbank.

Honorable mention was also made of the following gentlemen for the superior merit and excellence of their theses: George F. Quimby, on Pneumonia; M. J. Roberts, on Museums.

The Mott gold medal was awarded to Peter Hughes, of New York. The Mott silver medal was awarded to Albert S. Burtt, of New York. Honorable mention was made of specimens presented by Thomas C. Finnell, Jr., and Frank I. Disbrow.

The John E. Parsons prize for $100 for the best examination for the degree of M.D. was awarded to David Franklin, of New York.

The prize for the best examination in Pathology and Practice of Medicine was awarded to Charles Elihu Quimby, of New York. The prize for the best examination in Materia Medica and Therapeutics was awarded to George Hurlburt Felton, of Massachusetts. The prize for the best examination in Obstetrics was awarded to Henry Levy, of New York. The prize for the best examination in Ophthalmology and Otology was awarded to John Erasmus Harper. Honorable mention was made of Edwin B. Ramsdell for his examination on the same subject. The valedictory was then delivered by George H. Felton, A.M., of Massachusetts.

Dr. John Hall, of the Fifth Avenue Presbyterian Church, addressed the graduates.

After congratulating them on the completion of their curriculum, he urged them not to neglect the literature of their profession. They could only hope for large success by having an eye on the ever-growing mass of contemporary practical knowledge. If they were to be thoroughly informed men, they must not allow a long vacation to follow their graduation, or postpone study until later years. For just in the degree in which success was reached would the time for reading be reduced. In regard to their relations with professional brethren, he had scarcely ever known any man to succeed in life who stood badly with his own class. The temptation to young men who are struggling slowly forward, under the shadow of some older and successful rival, is to criticise and depreciate. Success was rarely reached in any profession without merit of some kind, and the wise and honorable method—that which is becoming in a medical gentleman—is to own the merit frankly, and be silent regarding the supposed deficiencies. Men as individuals are often mean and base and grossly mistaken. but let a noble, generous sentiment be uttered in a crowd, and the crowd will be ready to appreciate and applaud. A professional man, therefore, who has inherent right to respect and confidence will do the best by throwing himself on the sense of justice of the mass of his fellows without proclaiming his own goodness or his contempt for those whom he deems successful by trick or by accident. Every profession had its charlatans; but as a rule, they may be left to themselves and the public. The successful men, as a rule, deserved their success. "I would rather," said Dr. Hall, "have a favorable verdict from a dozen of my own class than the plaudits of a thousand outsiders."

He concluded by urging upon them the claims of Christianity, maintaining that the medical gentleman failed to rise to his true level without it.

The Academy was tastefully decorated, was well filled as usual on such occasions, and the music was furnished by Grafulla's band.

NOW READY.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS

By SIDNEY RINGER, M.D.,

Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price, - - - - $4.50

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"The author, as we have said, designed the book simply as an introduction to Therapeutics for the use of students and young practitioners. That to such it will be found most useful there is no doubt; but we are also sure that, from the mass of valuable, readable, and well-arranged information it contains, and the numberless minor practical hints scattered throughout its pages, the work will be almost equally useful to the busy practitioner; and that it will receive from the profession generally the warm welcome which it deserves."—*British Med. Jour.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on Therapeutics."—*St. Louis Med. and Surg. Journal.*

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachms
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its present sale exceeds $100,000 per year at wholesale. Its almost universal adoption by the profession, as the above figures show, is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK'S preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proven itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

J. R. LEAMING, M.D.,
Attending Physician at St. Luke's Hospital.

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

J. H. TYNDALL, M.D.,
Physician at St. Francis' Hospital.

LEWIS A. SAYRE, M.D.,
Professor of Orthopœdic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

JOSEPH E. WINTERS, M.D.,
Assistant Demonstrator of Anatomy, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Prof. of Chem., Mat. Med. and Therp. in the N. Y. College of Dent.; Prof of Chem. and Hygiene in the Am. Vet. College, &c., &c.

PRICE LIST.

LACTOPEPTINE (Powder in oz. Bottles) per oz.	$1 00	Elixir Lactopeptine, Strychnia & Bismuth, per doz.	$15 00
" (Powder in oz. Bottles) per doz.	10 00	" Calisaya Bark & Iron, with Lactopeptine, "	15 00

W. H. Schieffelin & Co.'s

SOLUBLE QUININE PILLS.

We would be glad to have *any* of our Soluble Pills subjected to intelligent test; but as the medicine most in demand in pilular form is Quinine, we particularly court a critical examination of our Quinine Pills, and desire that they be subjected to the test either of analysis or of therapeutic effect.

This scrutiny is invited with confidence, as we invariably use *bleached* Sulphate of Quinine, of the best American brands, in full and exact weights, and because we have never heard of a case where our pills failed to produce the effect which would have been obtained from an equal quantity of Sulphate of Quinine in its usual form.

In order to facilitate an analysis, we suggest the following process as simple and reliable.

Remove the coating from pills representing say 20 grains of Quinine. Separate excipient by rubbing them in a mortar with 2 ozs. water until perfectly smooth, and then dissolving by aid of a few drops of dilute Sulphuric Acid and filtering. Treat the filtrate with aqua ammoniæ in excess and filter again. Wash the precipitate left on the filter, by passing 1 oz. water through it. Dry on filter by gentle heat. Subject 10 grains of it to the

TEST FOR QUININE,

Published in the *U. S. Pharmacopœia*, as follows:

"When ten grains of the salt are agitated in a test-tube with ten minims of officinal water of Ammonia and sixty grains of Ether, and allowed to rest, the resulting liquid separates into two transparent and colorless layers, without any white or crystalline matter at the surface of contact."

Any such matter floating there would indicate the presence of Cinchonia, Cinchonidia, or Quinidia.

We are happy to announce that the recent decline in the price of Quinine enabled us to reduce the price of the pills; as may be seen by referring to our latest Price-Lists.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For ***Headache,*** or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

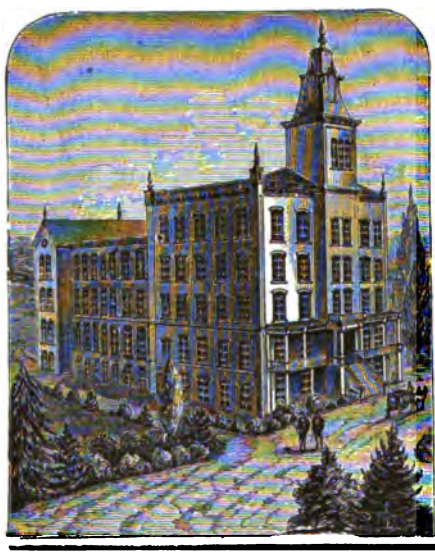
In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... .... 7 00

In Saratoga. *Delivered at the Cars.*

Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.



THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors; billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton [L. I.], N. Y.

Physicians have experienced the need of a reliable and more pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the Granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons, and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations, we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our Granules have been appreciated and are being extensively used by the profession. Be careful and see that "McKesson & Robbins" is on the label.

A physician in St. Louis, who has for some time been using our Pills, prescribed **"Gelatine-Coated Phosphorus Pills, 1/100 gr." intending to have the McKesson & Robbins Pills** dispensed, but **did not perceive the usual effects** after administering them to the patient. Upon investigation, he found the Pills resembled ours somewhat in external appearance, but on cutting one open, he found it contained **hardly a trace of Phosphorus.** The doctor went to the druggist, who had dispensed the prescription, and found that, not having our Phosphorus Pills in stock, **he had dispensed an imitation;** the druggist claimed that he was warranted in so doing, as the physician had not taken the precaution to put the name **McKesson & Robbins** upon his prescription, although the physician had been in the habit of specifying our pills, and the druggist knew it. We have had our attention called to several cases of this character, regarding the Quinine Pills, Morphia Granules and others, when, on **failing to obtain results,** the physicians have found that they **were being imposed upon by imitations;** this has induced them to write **"McKesson & Robbins' C. C. Pills"** in full upon their prescriptions and add, **"send no others."** We have full lines of our Pills in all of the large, and in most of the small cities, and there is no excuse for substituting imitations.

Price Lists furnished upon application. See list of formulas, last page.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist,

Pneumatic Aspiration

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

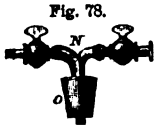
"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:

Fig. 68.

Fig. 77.

Fig. 78.



The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration.

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold-plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions.....$18 00

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78), to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions, 16 00

No. 3. Dieulafoy's Notched Aspirator, Nickel-plated, with two Needles, Tubes, etc., in case.....$14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional.....6 00

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of.....3 40

☞ *Full description on application.*

N.B.—See our other Advertisement in alternate numbers of the RECORD.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

MANUFACTURED BY

TROMMER EXTRACT OF MALT CO.,

FREMONT, OHIO.

In corresponding with Advertisers please mention **The Medical Record.**

Peck's Cod-Liver Oil and Wild-Cherry Bark.

Unequalled for rapid and efficient action in Phthisis, Deficient Nutrition, etc. Agrees with the most delicate stomach, never causes eructations, is a positive tonic. Its taste is far more agreeable than that of any other combination. It is a perfect emulsion of fifty per cent. of oil and twenty-five per cent. of bark, from which the oil does not separate, and which keeps indefinitely without change.

Dr. W. L. ATLEE, Jr., Philadelphia, writes:—"I have used your Ol. Morrh. cum Prun. Virg. in upwards of a hundred cases. The results were invariably satisfactory and very much better than I ever obtained with other preparations of Cod-Liver Oil."

Peck's Elixir of Phosphorus.

For **Paralysis, Melancholia, Lapse of Memory, etc. A powerful Aphrodisiac.** A clear, permanent, palatable solution, containing $\frac{1}{100}$ gr. unaltered Phosphorus in each teaspoonful.

Sold by apothecaries generally.

H. T. PECK & CO., Chemists, Philadelphia.

INTERNATIONAL EXHIBITION AWARDS TO

Hance Brothers & White, Philadelphia.

In addition to the testimonials from eminent medical practitioners, which it has been our good fortune to present from time to time to the physicians and pharmaceutists of the country, we have now the pleasure of announcing **THREE AWARDS** from the Centennial Exhibition, as follows: One for the **Pharmaceutical and Chemical Products** of our house. One for **Hance's Drug Mill** (*the only premium given for Drug Mills*). One for **Hance's Non-Wasting, Percolating and Filtering Apparatus.**

The flattering verdict pronounced upon our exhibit by the medical and pharmaceutical visitors to the International Exhibition being confirmed by the *Bureau of Awards*, justifies the confidence that our efforts to supply *reliable preparations* are appreciated; and will certainly stimulate us to fresh exertions to maintain the reputation which we have established. Our highest ambition has been to secure the honor of being known as the manufacturers of THOROUGHLY RELIABLE PREPARATIONS, and our patrons may rest assured that no endeavor will be spared in our determination to deserve this confidence.

HANCE BROTHERS & WHITE, Pharmaceutical Chemists,

Catalogue of our manufactures mailed upon application. **Offices—Callowhill Street, Cor. of Marshall, Philadelphia.**

PHOSPHORUS PILLS—PRICE REDUCED.

Believing that the present demand for Sugar-Coated Pills of Phosphorus and its combinations will justify a reduction of the price, Messrs. Allaire Woodward & Co. have modified their list on these pills, as follows:

Phosphorus, 1-100 gr. per 100 - - - **40c.**	**Phos., Iron & Quinine,** { Phosphorus, 1-100 gr. / Vallet's Mass, 1 " / Quinia Sul., 1 " } ———
" **1-50** " " - - **40c.**	
" **1-25** " " - - - **40c.**	**Phos., Iron, Nux & Quin.,** { Phosphorus, 1-100 " / Vallet's Mass. 1 " / Ext. Nux. Vom. ½ " / Quinine, Sul., 1 " } ———
Phosphorus Comp'd, { Phosphorus, 1-100 gr. / Ext. Nux. Vom., ½ " } **50c.**	**Phosphide Zinc, 1-2 gr. per 100** - - **$1 25**
" **and Nux. Vom.** { Phosphorus, 1-60 " / Ext. Nux. Vom., ½ " } **50c.**	" **1-4** " " - - **80**
" **Iron & Nx. Vm.** { Phosphorus, 1-100 " / Vallet's Mass 1 " / Ext. Nux. Vom. ½ " } **60c.**	" **1-8** " " - - **60**
	" **and Nux, each 1-8 gr.** - **60**
	" **Nux & Ext. Can'bis Ind. ea. 1-8 gr. 65**

The manufacturers feel confident that by their mode of manipulating the mass, *less of the objectionable effects* will be experienced by the patient, and *better results* obtained than by the use of any similar goods in the market. *Pills will be mailed to any part of the world upon receipt of list price.* Complete lists of Sugar-Coated Pills. Fluid and Solid Extracts mailed upon application.

ALLAIRE WOODWARD & CO., Peoria, Ill.

The attention of the medical profession is invited to this instrument as the most perfect ever invented for treating Prolapsus Uteri, or falling of the Womb. It is an Abdominal and Uterine Supporter combined.

The Abdominal Support is a broad morocco leather belt with elastic straps to buckle in front, are shaped the hips, with concave so as to hold up the abdomen.

The Uterine Support is a cup and stem made of very highly polished hard rubber, very light and durable, shaped to fit the mouth of the womb with openings for the secretions to pass out, and which can be sent to any curve desired, by heating in very hot water.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, pass down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic, adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

This instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversion, or any Flexion of the Womb, and is used by the leading Physicians with unfailing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Sent by mail, at our risk, on receipt of price, with 16 cents added for postage; or by express C. O. D.

McINTOSH'S NATURAL UTERINE SUPPORTER CO., 296 West Lake Street, Chicago, Ill.

Our valuable pamphlet, "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

Printed Pills and Granules

These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of **accuracy**, and a **safeguard** against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacists rests on the **entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating**, which is vegetable; **perfect preservation in all climates; entire security against mistakes or substitution**, every pill or granule **having printed upon its surface either its common name or its composition**, as Pil. Cath. comp., or Pil. Quin, ¼ grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal:

Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 6 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

LEUBE'S MEAT SOLUTION.

Carefully prepared, in one pound glass jars always on hand.

For formula and use see Thomasen's "Cyclopædia of the Practice of Medicine," Vol. V, page 283; and Vol. 12, Special Note before Table of Contents; and N. Y. MEDICAL RECORD, Jan. 19, 1878, page 58.

"Of all the meat-preparations the *only reliable* one is Leube's Solution, made by Hoffmann's Formula."—Dr. E. R. PEASLEE, *Proceed. N. Y. Acad. Medic., Dec.* 20, 1877.

As the Meat Solution does not keep long, its freshness can only be guaranteed by ordering *direct from the manufacturer*. Orders by postal-card or telegraph promptly attended to.

FRED. HOFFMANN, Apothecary and Chemist, Sixth Ave. & 46th St., N. Y.

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end), *20 cents*
Seven " " " " " *$1.00.*
Crusts, each (Hermetically Sealed), ... *2.00.*

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of information may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free.

A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases—such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

E. F. HOUGHTON & CO.,

MANUFACTURERS,

215 South Front Street, Philadelphia.

THE FOLLOWING COURSE OF INSTRUCTION

IN

Ophthalmology and Otology

WILL BE GIVEN AT THE

N. Y. Ophthalmic and Aural Institute,

No. 46 East 12th Street,

From March 1st to the beginning of June.

1.—**Histology of the Eye and Ear.** By Dr. E. GRÜNING.

2.—**Physiological Optics and Acoustics.** By Dr. H. Knapp.

3.—**Ophthalmoscopy and Otoscopy.** By Dr. T. R. Pooley.

4.—**Functional Examination of the Eye and Ear.** By Dr. E. GRÜNING.

5.—**Practical Exercises in Operating.** By Dr. H. KNAPP, assisted by Dr. T. R. POOLEY.

6.—**Ophthalmic and Aural Clinics.** By Dr. H. KNAPP.

The first five courses will be given once a week; the clinics three times a week. The students will have the privilege of attending the daily Dispensary and witnessing the operations.

Fee for the whole course, $30; for each course taken separately, $10.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and BARTHEZ, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of **CASWELL, HAZARD & CO., New York,** and of all respectable Chemists throughout the world.

TO PHYSICIANS!

THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars.

The price of the Celluloid truss ranges about as other trusses

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

NELATON'S CATHETERS,

Sometimes called Jacques', but really the invention of Dr. Nelaton, Surgeon to the late Emperor Napoleon III., have, by their decided advantages over every other kind, become a necessity in the practice of the leading Physicians and Surgeons of Paris, London, and other European Cities.

Their introduction here has been so successful that imitations are already in the market, much inferior in quality. Having secured a large stock from the original manufacturers during my stay in Paris, I am enabled to offer the genuine at a reasonable price.

These are made of *pure brown rubber*, with a smooth, soft surface, delicately flexible; and if the simple directions on the box are followed, their introduction will cause little or no pain, and effect their purpose much more easily and effectively than any other kind.

Sets of nine sizes, numbered and with wire, the whole neatly boxed, will be sent by mail on receipt of $6.00. THEO. RICKSECKER, 146 & 148 WILLIAM ST., NEW YORK.

Please mention MEDICAL RECORD.

PRESCRIPTION AND CLINIC RECORD.

The pocket-book of every careful physician. The best medium between physician and druggist—gives trusty record of cases—mathematical dates of monographs—of hereditary tendencies—of medical statio. Author and copyright, E. SEGUIN, M.D., 41 West 20th St., New York. One copy, 35c.; four copies, $1; 500 copies, $100; by the 1,000; $150.

SUPERIOR NUTRITION THE LIFE.

IMPERIAL GRANUM.

THE INVENTION OF AN EMINENT FRENCH CHEMIST.

To Physicians and the Public:

This preparation is, in composition, as advertised, principally the Gluten derived, by chemical process, from *very superior growths of wheat*, and should not be confounded with burnt or boiled Flour, in which the Gluten or sanative qualities are destroyed or made medicinally inert, nor with Crushed Wheat, or finely ground Wheaten Grits, styled "Medicinal Food," and sold under various names, in which the starch and impurities contained in wheat are retained in larger quantity.

By Dubisson's formula, the starch, impurities and soluble matter found in the Wheat Cereal are effectually excluded; the Gluten only retained, which is condensed, granulated and prepared to keep in all climates, and justly entitled

IMPERIAL GRANUM.

It is well known, and should be fairly considered, that nothing of merit can b *favorably received and commended by the public without being followed by* imitations of a questionable character. IMPERIAL GRANUM *is not the exception, for no* preparation *has* attracted more attention, *nor been more fiercely imitated, by competition*, even to wording and shipping order.

Whilst again it can be truly said that no preparation ever offered for sale has been more carefully prepared and thoroughly tested, nor has met with a more welcome reception and universal approval, or afforded more relief to invalids or to young and suffering children and aged persons. This has been confirmed by thousands of testimonials from Chemists, Physicians, Heads of Families and the Press.

Respectfully,

E. HEATON,

General Agent for the United States.

MEDICAL BOOKS.

New Books received as soon as published.

A COMPLETE MEDICAL CATALOGUE SENT ON APPLICATION

LAZELL, MARSH & GARDINER'S POWDERED MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weights* for the *Solid Medicinal Extracts.*

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.		per oz.
Powd. Ext. Aconite Leaf	.40	Powd. Ext. Jalap	.40

FOOD IS THE BEST TONIC!!

MENSMAN'S

PEPTONIZED

BEEF TONIC.

TRADE MARK.

The great necessity for a fluid food that would possess **all the elements necessary for the support of the system**, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

DRUGGISTS AND CHEMISTS,

Fifth Ave., cor. 24th St.; & Sixth Ave., cor. 39th St., New York.

MACHINE-MADE SUPPOSITORIES.

Vaginal Weighs 86 Grains.

Rectal Weighs 22 Grains.

Child's Weighs 6 grains.

All of the above Suppositories are made by Machinery under **cold pressure**, no heat being used. Nor is any excipient used to form the mass, they being composed entirely of Butter Cacao and the medicament prescribed. Made by this process, they are **uniform** in **size** and **shape, firm** in **consistency, elegant** in appearance, and perfectly **reliable** in **quality.** Being hard and compact, they are easily introduced, melt rapidly, and are in **every way much superior** to the **clumsy, ill-shapen, hand-made article** commonly dispensed by druggists.

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 8 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

Pullna Bitterwater.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

PRICE.—Case of 20 Pint Jugs.....$6.25 by
" Case of 50 Pint Jugs..... 8.00 "

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 13, 1875.)

Please specify, in ordering from any wholesale house, **Warburg's Tincture,** made by **F. A. REICHARDT.**

Price per bottle, 1 oz., **75c.**; per doz., **$5.00.** Per pint, **$5.00**; per doz., **$50.00.**

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

P. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ½ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen: **$10.00** per gross.

MIAMI MEDICAL COLLEGE OF CINCINNATI.

Next Session will commence October 3d, 1877. Professors' Tickets, $40.00.

FACULTY.—JOHN A. MURPHY, M.D., Dean; E. WILLIAMS, M.D.; WM. CLENDENIN, M.D.; WM. H. TAYLOR, M.D.; J. B. HOUGH, M.D.; W. H. MUSSEY, M.D.; T. H. KEARNEY, M.D.; J. C. MACKENZIE, M.D.; W. B. DAVIS, M.D.; BYRON STANTON, M.D.

For Circulars, address JOHN A. MURPHY, M.D.,
No. 163 West 7th Street.

STARLING MEDICAL COLLEGE, COLUMBUS, OHIO.

The Thirty-first Session of Starling Medical College will commence October 4, 1877, and continue until March, 1878. It will be preceded by a preliminary course beginning September 1, 1877. Extensive additions have recently been made to the Museum and other teaching facilities of the College.

Francis Carter, M.D., Emeritus Professor of Obstetrics and Diseases of Women and Children, and Dean of the Faculty.
H. G. Landis, A.M., M.D., Professor of Obstetrics.
Sam'l D. Turney, M.D., Professor of Diseases of Women and Children.
Theo. G. Wormley, M.D., LL.D., Ph.D., Professor of Chemistry.
James H. Pooley, M.D., Professor of Surgery.
Starling Loving, M.D., Professor of Practice of Medicine.
John M. Wheaton, M.D., Professor of Anatomy.
R. E. Fullerton, M.D., Professor of Materia Medica and Therapeutics.
W. J. Conklin, M.D. (of Dayton), Professor of Physiology.
W. J. Wolfley, M.D., Professor of Opthalmology and Otology.
Alex. Dunlap, M.D., Professor of Surgical Diseases of Women.
Hon. J. W. Baldwin, M.A., Professor of Medical Jurisprudence.
D. A. Morse, M.D., Professor of Nervous Diseases and Insanity.
Otto Frankenberg, M.D., Professor of Pathology.
T. C. Hoover, Prosector to the Chair of Surgery, Lecturer on Minor Surgery and Demonstrator of Anatomy.

College, corner of State and Sixth Sts.; Dean's Office, 161 East State St.; Secretary's Office, 72 East Gay St.

Letters of inquiry should be addressed to the Dean.

PROF. FRANCIS CARTER, M.D., Dean, Columbus, Ohio.

UNIVERSITY OF MICHIGAN.

DEPARTMENT OF MEDICINE AND SURGERY.

The 29th annual course of lectures will commence on Oct. 1, 1878, and continue *nine months*.

Course separate but equal for women.

Matriculation Fee, *paid but once*—Residents of Michigan, $10; non-residents, $25.

Annual Dues—Residents of Michigan, $20; non-residents, $35.

Graduation Fee—For all alike, $10.

Send for Circular and Catalogue.

A. B. PALMER, M.D., DEAN, Ann Arbor, Mich.

IOWA STATE UNIVERSITY, IOWA CITY, IOWA.

MEDICAL DEPARTMENT.—SESSION OF 1877-'78.

The next regular course will commence on Wednesday, October 24th, 1877, and continue until the first Wednesday in March, 1878. The preliminary term will begin on Wednesday, October 10th, and continue until the opening of the regular course. Clinical instruction in Mercy Hospital gratuitous. Advanced students will be intrusted with the care of cases. Applicants for graduation will be required to perform operations upon the cadaver. An abundant supply of dissecting material constantly on hand.

FEES.—For the entire Course, $80.00. Matriculation Ticket, $5.00. Demonstrator's Ticket, $5.00. Graduation Fee, $25.00. For further information, address W. F. PECK, M.D., Dean, Davenport, Iowa, Or, ELMER F. CLAPP, M.D., Sec'y, Iowa City, Iowa.

N. H. MEDICAL INSTITUTION AT DARTMOUTH COLLEGE.

The *Eighty-second* Annual Course of Lectures begins Aug. 1, 1878, and continues fourteen weeks. Recitations from Dec. 5 to June 20.

FACULTY:—E. R. Phelps, M.D., LL.D., Practice Emeritus; A. Smith, M.D., LL.D., Therapeutics Emeritus; O. P. Hubbard, M.D., LL.D., Chemistry; E. R. Peaslee, M.D., LL.D., Gynecology; J. Ordronaux, M.D., LL.D., Medical Jurisprudence; C. P. Frost, M.D., Practice; P. S. Conner, M.D., Surgery; E. S. Dunster, M.D., Obstetrics; H. M. Field, M.D., Therapeutics; L. B. How, M.D., Anatomy and Physiology.

FEES:—Matriculation, $5; Lectures, $77; Graduation, $25; Recitations, $40.

For Circular, address C. P. FROST, M.D., Dean, Hanover, N. H.

MEDICAL DEPARTMENT OF HARVARD UNIVERSITY, BOSTON, MASS.

NINETY-FOURTH ANNUAL ANNOUNCEMENT. (1877-'78.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 27th, 1877, and ends the last Wednesday in June, 1878. Persons who hold no degree in arts or science must hereafter pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 24th.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. R. H. FITZ, Secretary, 108 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF YALE COLLEGE.

Spring Term begins February 14, and closes June 25, 1878.

Winter Term begins October 3, 1878; closes January 30 1879

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.

(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE (Medical Dept. Syracuse University), SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar.

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE, OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1877, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

WM. H. BYFORD, A.M., M.D., President.
T. D. FITCH, M.D., 290 West Monroe St., Secretary.
CHAS. W. EARLE, M.D., 37 Park Ave., Treasurer.

Official Announcements of the Medical Colleges of the U. S.

The Fourteenth Annual Course of Lectures in the

Medical Department of the University of Wooster,

LOCATED AT CLEVELAND, OHIO,

Will begin Wednesday, October 2d, 1877, and continue until the last Wednesday in February, 1878. Medical and Surgical Clinics, Monday and Tuesday, Thursday and Friday of each Week, at Charity Hospital. The Preliminary Term commences Sept. 19. The Summer Course of Recitations and Clinics begins April 2, 1877, and continues 12 weeks.

FACULTY:—G. C. H. WERNER, M.D., Dean; L. FIRESTONE, M.D., LL.D.; W. J. SCOTT, M.D.; H. J. HERRICK, M.D.; CONWAY NOBLE, Esq.; A. C. MILLER, M.D.; JOSE POMERERA, M.D.; D. R. SMITH, M.D.; H. W. KITCHEN, M.D.; T. CLARK MILLER, M.D.; JOHN H. LOWMAN, M.D.; G. T. GENTSCH, P.C. For Circular and Catalogue, address H. W. KITCHEN, Sec'y, No. 3 Euclid Avenue, Cleveland, O.

CLEVELAND MEDICAL COLLEGE,

Cor. St. Clair and Erie Sts. Founded 1843.

FACULTY:—JARED P. KIRTLAND, M.D., LL.D.; J. L. CASSELS, M.D., LL.D.; PROCTOR THAYER, M.D.; JOHN BENNETT, M.D., Dean; JACOB LAISY, M.D.; JOHN B. DARBY, M.D.; E. W. MORLEY, M.A.; FRANK WELLS, M.D.; ISAAC N. HIMES, M.D.; X. O. SCOTT, M.D.; R. W. HOLLEDAY, M.D.; N. P. SACKRIDER, M.D.; LEWIS BUFFETT, M.D.; H. H. POWELL, M.D.; WILLIAM WALLACE HOLLIDAY, M.D.

FEES.—Lecture Tickets, including Matriculation and Demonstrator's Ticket, $50. WINTER SESSION.—Commences on the third Wednesday in September, and continues 24 weeks.

SUMMER SESSION.—Commences on the first Monday in April.

Medical School of Maine,

AT BOWDOIN COLLEGE.

Fifty-Eighth Annual Course of Lectures for 1878 will commence February 14, and continue sixteen weeks.

FEES.—Matriculation (payable each term), $5.00. Full Course (in advance), $75.00.

ALFRED MITCHELL, M.D., Secretary,
BRUNSWICK, ME.

Woman's Medical College of Pennsylvania.

THE TWENTY-EIGHTH WINTER SESSION

Will open on Thursday, October 4, 1877, in the commodious new College Building. Clinical instruction is given in the WOMAN'S HOSPITAL, Pennsylvania, *Wills, Philadelphia* and *Orthopædic Hospitals*. *Spring Course* of Lectures, Practical Demonstrations, and *Winter Quizzes* are free (except for expense of material) to all Matriculants of the year.

Address

RACHEL L. BODLEY, A.M., *Dean*,
North College Ave. and 21st Street, Philadelphia, Pa.

WANTED.

Those of our Subscribers who have received duplicate copies of No. 338 and 361 of THE MEDICAL RECORD will greatly oblige the Publishers if they return them by mail to

WM. WOOD & CO., 27 Great Jones St., New York.

LONG ISLAND COLLEGE HOSPITAL, BROOKLYN, N. Y.

Annual Announcement and Circular, 1877-78.

The READING AND RECITATION TERM will commence October 4, 1877, and close February 14, 1878.
The REGULAR TERM will open March 5, 1878, and close the last week in June following.

FACULTY OF THE COLLEGE.

SAMUEL G. ARMOR, M.D., LL.D., Professor of the Practice of Medicine, and Dean.
GEORGE W. PLYMPTON, A.M., Professor of Chemistry.

7. A Case of Ossification of the Choroid with the Ophthalmoscopic Appearances. By Prof. Laquer, of Strasburg. (Plate I.) Translated by Dr. C. Williams, of New York 284-290
8. Thirteen Cases of Ocular Tumor, with a case of Tumor of the Optic Nerve and a Case of Panophthalmitis with a Clot simulating a Tumor. By Dr. E. L. Holmes, of Chicago. With the Microscopical Description of the Specimens by Dr. H. Knapp 291-303
9. Contributions to the Pathological Anatomy of the Human Eye. By Dr. Ad. Alt, M.C.P.S.O., of Toronto, Can. With Plates II., III. and IV 304-333
10. Ophthalmological Review. By H. Knapp and E. Gruening 334-339

B.—OTOLOGICAL PART.

1. A Foreign Body in the External Auditory Canal Causing Reflex Nervous Symptoms—Reflex Hemicrania. By Dr. L. Heydenreich of St. Petersburg. Translated by Clarence J. Blake, M.D., Boston 333-335
2. Otological Review. By Clarence J. Blake, M.D., of Boston 336-342

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

Medical Pictures and Portraits

For PHYSICIANS' OFFICES.

Harvey Demonstrating the Circulation of the Blood

A fine photograph, from a valuable engraving.

Size, 7x9 inches, on fine white mount, 13x16. Price, $1.50
Size, 15x18 " " " 22x28. " 4.00

The engraving of the above is entirely out of print.

THE ANATOMICAL LECTURE.

(After Rembrandt.)

A fine photograph, in both size and price same as Harvey, making a fine companion picture.

THE ANATOMIST.

From a painting by the great artist Max of Germany.

It represents a Professor in deep study, sitting by the side of a female subject of great beauty.

A Fine Etching. Price, $1.00
Or, Proof Copies. " 1.25

JENNER VACCINATING A CHILD

Photograph.

Size, 8½x10 inches, on fine white mount . Price, $1.50.

AMBROISE PARÉ.

To this celebrated French surgeon is attributed the introduction or first use of Ligatures, instead of the old mode by the actual cautery. It represents an operation on the leg of a soldier on the battle-field, surrounded by several eminent men who are looking on with great interest. This engraving, now very scarce and rarely found, has been published in fine Photograph, in three sizes, viz.:

7x9 inches, on white mount, 13x16. Price, $1.50
15x18 " " " 22x28. " 4.00
7x13 " on granite " 11x19. " 2.00

HIPPOCRATES.

A fine photograph from an old and valuable engraving.

Size, 11x14 inches. Price, $1.00.

PHOTOGRAPH PORTRAITS OF

(Imperial Size)

SIR ASTLEY COOPER,
DR. JOHN HUNTER,
DR. RICHARD BRIGHT.

} Price, 50 cents each.

THE LUNATIC ASYLUM.

This remarkable picture by KAULBACH, represents a scene in the yard of a Mad-House. A group of unfortunates, each one occupied with the ideas of his own fancy. One as a king, another as a miser, and so on. As a composition and study, it is one of great interest.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

ANDRÉ VESALE.

A picture of this celebrated anatomist, at work in his attic, listening to approaching footsteps.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

Prof. CHAS. A. BUDD.

A photograph from life of the late Prof. C. A. Budd, and the only portrait approved of by himself and family. A fine likeness.

Imperial size, from life. Price, 50 cents.

OTHER PHOTOGRAPHS ARE IN PREPARATION.

Sent by mail, post-paid, on receipt of price.

WM. WOOD & CO., 27 Great Jones Street, New York.

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

Prepared by CLIN & CO., Pharmacists, Paris.

LA PLATA EXTRACT OF MEAT.

CH. DELACRE,
Sole Consignee,
IXELLES, BELGIUM.

Agents for the U. S.,
E. FOUGERA & CO.,
NEW YORK.

This Extract is a pure extract of Beef, prepared according to the improved process of Baron von Liebig, unsurpassed in quality, free from fat and gelatine, each pound of which contains the soluble nutritive constituents of 34 to 36 pounds of the finest beef, exclusive of bones and fat, corresponding to about 45 pounds of good butcher's meat. As a medicinal agent it will be found of great value to the sick, invalid, and persons and children of weak constitutions. ***It will keep unaltered for years in any climate.***

CAUTION.—Physicians wishing to use a pure extract of beef will do well to specify the ***"La Plata,"*** since it is never offered for sale until it has been analysed by Mr.

CH. DELACRE, Chemist, General Consignee at Brussels,

and found by him to possess the essential qualities of the best articles of this kind.

None genuine without the above trade-mark—*Bullock reclining.*

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

In corresponding with Advertisers please mention **The Medical Record.**

ON SURGERY

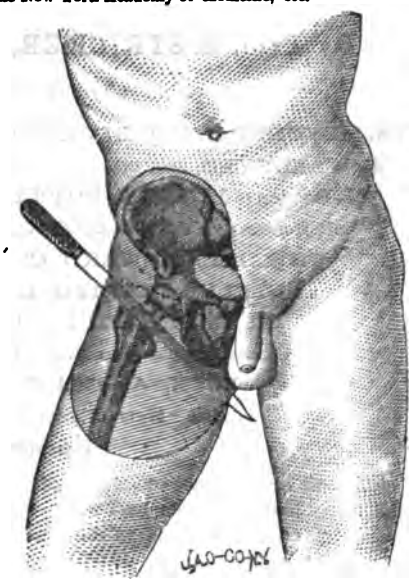
THE PRINCIPLES AND PRACTICE.

By FRANK HASTINGS HAMILTON, M.D., LL.D.,

Professor of the practice of Surgery with Operations, and of Clinical Surgery in Bellevue Hospital Medical College; Visiting Surgeon to Bellevue Hospital; Consulting Surgeon to the Bureau of Surgical and Medical Relief for the Out-Door Poor at Bellevue Hospital; to the Central Dispensary, and to the Hospital for the Ruptured and Crippled; Fellow of the New York Academy of Medicine, etc.

In one royal octavo volume of about 1,000 pages, illustrated by 467 Engravings on wood.

Price, in extra muslin, $7.00; or in leather, $8.00.



Anatomy of Hip Joint, and Guides for the Knife.

NOTICES OF THE PRESS.

"Has evidently been prepared with the greatest care, both on the part of the author and his publishers; and as a text-book for the students, it reflects the highest credit upon its well-known and gifted writer. As a text-book for the student, or one of reference for the busy practitioner, it undoubtedly is one of the best and *most modern* that has yet appeared."—*The Medical Record.*

"A valuable addition to our list of text-books, an excellent work of reference, a credit to our professional literature."—*New York Medical Journal.*

"It will be found an excellent and common-sense volume."—*London Medical Times and Gazette.*

"This is one of the best text-books upon Surgery which we have ever seen, and we recommend it highly to the profession."—*Chicago Medical Examiner.*

"Prof. Hamilton's latest work is one that will add to his already high reputation. . . . It is full of valuable practical suggestions and directions."—*Am. Journal of Medical Science.*

"American in plan, scientific in method, written in clear, concise, classical English, Prof. Hamilton's Surgery is a noble legacy to the medical student, an honor to the profession, and an ornament to our native tongue."—*Detroit Review of Medicine.*

ROSCOE.

Lessons in Elementary Chemistry,

ORGANIC AND INORGANIC.

By HENRY E. ROSCOE, B.A., F.R.S.,

Professor of Chemistry in Owen's College, Manchester, England.

SECOND EDITION.

With a Chromo-Lithograph of the Solar Spectra. In one very neat 18mo volume, fully illustrated, bound in muslin, red edges.

PRICE, $1.50.

NOTICES OF THE PRESS.

"It has no rival in its field, and it can scarcely fail to take its place as *the* text-book at all schools where chemistry is studied."—*Chemical News.*

"We regard Dr. Roscoe's as being by far the best work from which a student can obtain a sound and accurate knowledge of the facts and principles of rudimentary chemistry."—*The Veterinarian.*

"We should be gratified to see this little treatise find its way into the hands of all medical students who begin their course in chemistry."—*St. Louis Medical and Surgical Journal.*

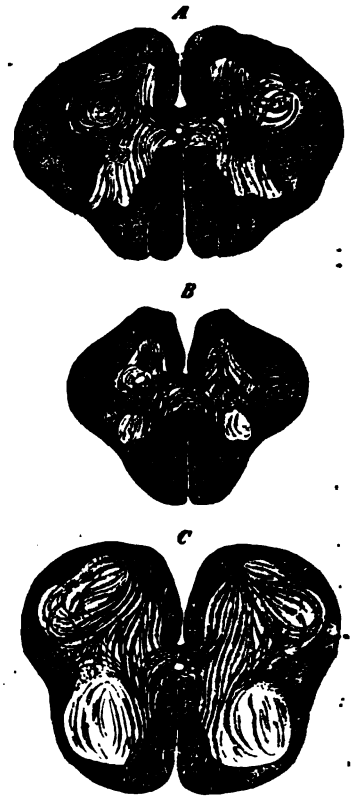
A MANUAL OF

HISTOLOGY



Transverse sections of the spinal cord of a child six months old at various levels. Magnified 8 diam. A. From the middle of the cervical enlargement. B. From the middle of the dorsal region. C. From the middle of the lumbar enlargement.

By Prof. S. STRICKER, of Vienna, Austria,

IN CO-OPERATION WITH

TH. MEYNERT, F. VON RECKLINGHAUSEN, MAX SCHULTZE, W. WALDEYER, and others. Translated by HENRY POWER, of London; JAMES J. PUTNAM and J. ORNE GREEN, of Boston; HENRY C. ENO, THOMAS E. SATTERTHWAITE, EDWARD C. SEGUIN, LUCIUS D. BULKLEY, EDWARD L. KEYES, and FRANCIS E. DELAFIELD, of New York. American Translation Edited by ALBERT H. BUCK, Assistant Aural Surgeon to the New York Eye and Ear Infirmary.

A most superb Octavo volume of over 1100 pages, with four hundred and thirty-one illustrations on wood, engraved in the finest style. Richly bound in extra muslin and in the best leather. Price in muslin, $10.00; leather, $11.00.

Sent by mail, postpaid, on receipt of price.

NOTICES OF THE PRESS.

"At once the most extended and valuable treatise on Histology which has yet appeared."—*Am. Journal of Medical Sciences.*

"The translation of Mr. Power covers 406 pages of the present edition; but the remaining articles are translated by the American gentlemen above named. Nearly two-thirds, therefore, of the book are translated by Americans, who are physicians especially interested in the departments which they have undertaken. In this there is evident advantage, as one who is already familiar with a subject is the more likely to grasp obscure points, which are perhaps rendered still more obscure by being couched in a foreign idiom. There is also likely to be more freshness about an article thus translated than if it form, in the original, one of a large number, and by different authors, translated by a single individual; for the weariness which must necessarily grow upon the translator of so large a volume, is not relieved by the increasing familiarity which he must acquire if the papers are all by the same author.

"This series of papers, edited and in many instances written by Prof. Stricker, constitutes at once the most extended and most accurate treatise on Histology extant. And as the study of Histology is a subject which admits only the latest and most accurate information to its aid, this work must necessarily supersede all others. It becomes, therefore, absolutely indispensable to every histologist and physiologist in the world, as well as to all physicians and surgeons who would pursue their departments with all the light of modern science."—*Phila Medical Times.*

"The need of a work of this kind has been felt for some time past. The last edition of Kölliker contains points which he himself has altered in his later editions, which have not been translated. The publication of this work is destined to give increased zest to the study of minute anatomy, a study which is becoming a necessity to any one who desires to be a thoroughly educated physician.

"We believe this book to be indispensable to any physician who desires to understand the present position of medical science, and to know, if not to find out for himself, the present knowledge of the minute anatomy of the human body. The authors, as remarked before, are men who have devoted themselves to these studies, and do not limit themselves to communication of the facts, but in many places treat of the methods of obtaining good specimens for self-study.

"As for the book itself, it has been published in good style. The type is clear, the wood-cuts are equal to those of the German edition, and there are but few typographical errors."—*The Medical Record.*

"Every medical student and every scientific practitioner should study this work, as, better than any other in the English language, it exhibits what has been demonstrated respecting the minute structure of the body."—*Detroit Review of Medicine.*

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

Messrs. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DORREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	20 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion, may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatizing Cod-Liver Oil the active digestive priciple of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine, effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion o it.

WAGNER'S MANUAL

OF

GENERAL PATHOLOGY:

AN

INTRODUCTION TO MEDICINE AND SURGERY FOR STUDENTS.

Translated from the Sixth German Edition,

BY

JOHN VAN DUYN, M.D., OF SYRACUSE. AND E. C. SEGUIN, M.D., OF NEW YORK.

CONTENTS.

GENERAL NOSOLOGY	Definition of Disease, General Sameiology, Diagnosis, Prognosis, Course, Duration, and Cure of Disease, Death, Apparent Death.
GENERAL ÆTIOLOGY	Ordinary External and Internal Causes of Disease, Animal and Vegetable Parasites.
GENERAL PATHOLOGICAL ANATOMY & PHYSIOLOGY	Local Disorders of Circulation (Hyperæmia, Embolism, Thrombosis, Etc.). Inflammation, General Alterations of Nutrition, Atrophy, Etc., Necrosis, Etc., Regeneration, Tumors, Etc.
PATHOLOGY OF THE BLOOD	Anæmia, Spanæmia, Plethora, Leucocythæmia, Melanæmia, Icterus, Uræmia, Suffocation, Lithæmia, Diabetes, Pyæmia, Fever, Marasmus, Etc.

NOTICES OF THE PRESS.

"No book in the English language gives such a thorough *resumé* of the elements of Medicine. The work, containing over seven hundred closely printed pages, is a storehouse of carefully-sifted and well-arranged information in all departments of pathology. Unlike many translations, the text is lucid and pleasant reading, and the work is altogether one of the most valuable which has been issued in the English language. It will be invaluable to the student of pathology, and should be in every physician's library."—*Philadelphia Medical Times.*

"It is a book full of knowledge for the practitioner. A medical student could not better commence work than by reading this book through. It has all the modern doctrines and discoveries."—*The Clinic.*

"We consider this book as one of the most valuable of the many medical works translated from the German into English. Its application is general, for it will be found not only upon the shelves of the surgeon and physician, but also in the hands of the medical student, who can rely upon no safer and surer guide through the obscurity which surrounds the causes and phenomena of disease. Above all, it contains what is to be found in no other single volume—it is filled with a complete and comprehensive series of systematically arranged abstracts, which form an epitome of general pathology."—*Boston Medical and Surgical Journal.*

"We commend the book to practitioners and students with perfect confidence that it will not disappoint them."—*Pacific Medical and Surgical Journal.*

. . . . . "Full of interest from the beginning to the end. The profession is certainly indebted to the industrious translators. The reader is likewise under obligations to the publisher for good paper, clear print, and easy handling of the book."—*American Practitioner.*

"The views now held by progressive investigators in this branch of medical science are given in a marvelous mass of well arranged and carefully digested facts, embracing all departments of pathology, and furnishing minute and detailed information on every subject pertaining to the morbid state and disease in all its protean forms. Wagner's systematic arrangement and skill in classification are admirable, particularly elucidating the bearings of facts upon the processes of disease."—*American Journal of Medical Science.*

"The translators have given us a very readable production, and, as a whole, the work is one which makes any library not having it incomplete."—*Peninsular Journal of Medicine.*

IN ONE LARGE OCTAVO VOLUME OF UPWARDS OF 700 PAGES.

Price, in extra muslin binding, $5.50; in leather, $6.50.

Sent by mail postpaid on receipt of price.

LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.

The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

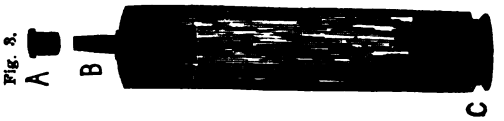
The Syringe before described has been adopted by the ***Medical Department of the United States Army.***

Fig. 1.

Pat. Dec. 2, 1873.

Fig. 2.

Fig. 3.



PRICES.

Glass Syringe in Plain Leather Case, 2 needles and vial.	$4 25
Glass Syringe in Morocco Case, 2 needles and vial	4 75

SUPERIORITY OF
WARNER & CO.'S
SUGAR-COATED PHOSPHORUS PILLS.

(Twenty-Four Combinations.—See List.)

For EFFICACY, PERFECTION, and FREEDOM from harm, this make of Pills of Phosphorus is unrivalled. The process originated and perfected by W. R. WARNER & Co., for the administration of Phosphorus in pill form, diffuses the Phosphorus, in its elementary state, thoroughly through the mass in a state of solution, a result by no other process attainable. The value of Phosphorus as a remedial agent is impaired if the element is not exhibited in its free state, and protected from oxidation by a perfect and *non-porous coating of pure white sugar*. You are cautioned to avoid cheaper and inferior brands.

Messrs. WM. R. WARNER & Co., *Manufacturing Chemists, &c.*

GENTLEMEN:—The Phosphorus Pills* submitted to me for Chemical Analysis and Microscopic Examination afford only traces of Phosphoric Acid, and contain the one twenty-fifth of a grain (gr. 1·25) of the element in each Pill, as expressed upon the label; they do not exhibit particles of undivided Phosphorus, the mass being perfectly homogeneous in composition, soft in consistence, and thoroughly protected by the non-porous coating of sugar from the oxidizing influence of the air. Each Pill is an example of what skill, care, and elegant Pharmacy can do. I regard them as a marvel of perfection.

Very respectfully,

A. E. McLEAN, *Analytical Chemist and Microscopist*,
40 and 42 Broadway, N. Y.

Late of Gardner & Ainslie's Laboratory, Edinburgh, Scotland.

NEW YORK, *November* 11, 1877.

DISEASES OF THE NERVOUS SYSTEM.

A LECTURE DELIVERED AT BELLEVUE HOSPITAL MEDICAL COLLEGE, DEC. 15, 1877.

BY C. E. BROWN-SÉQUARD, M.D.

(Reported for the MEDICAL RECORD.)

LOSS OF CONSCIOUSNESS IN EPILEPSY — RELATION WHICH CHANGES IN THE CIRCULATION IN THE CEREBRAL LOBES HAS TO THAT PHENOMENON—CESSATION OF CIRCULATION AND LOSS OF FUNCTION—CIRCULATION IN THE BRAIN OF CHOLERAIC PATIENTS—MUSCULAR IRRITABILITY AND WASTE AFFECTED BY REST—EPILEPTIC AURA—IMPORTANCE OF ITS ARREST—MEANS FOR PREVENTING ATTACKS OF EPILEPSY — COMBINATION OF MEDICINAL AGENTS — THEORY REGARDING THE CAUSES OF PARALYSIS AND CONVULSIONS—CONCLUSION REGARDING TREATMENT OF PARALYSIS AND CONVULSIONS, ETC.

GENTLEMEN: When interrupted yesterday, as you remember, I was speaking of loss of consciousness as an effect of peculiar change in the circulation of the brain. As then stated, I proposed long ago to explain the loss of consciousness which exists in attacks of epilepsy, by the production of the contraction of blood-vessels in the cerebral lobes. Indeed, contraction does take place; it is part of the convulsions which occur in attacks of epilepsy. The same thing takes place in the blood-vessels—for instance, in the face, and the face becomes pale. There is no doubt that such fact exists in the beginning of almost all attacks of epilepsy. Although theoretically the organ of consciousness is situated in the cerebral lobes—although it is clearly because of the cessation of the circulation in the cerebral lobes that cessation of cerebral activity exists, it is also certain that it is not simply on account of that cessation of circulation in the cerebral lobes that loss of consciousness occurs. This can be proved in the following manner: in the first place, if we galvanize both sympathetic nerves in the neck, thereby producing the greatest contraction that can take place, thus completely excluding blood from the small arteries which enter the convolutions of the brain, we do not find that such contraction is alone sufficient to produce loss of consciousness. Disorder of mental activity is produced in the animal upon which we operate, but there is no complete loss of consciousness by any means.

In the second place, if we cut the four large vessels which go to the brain, so as to arrest the circulation there at once, the loss of consciousness which appears is not immediate.

In a large proportion of the attacks of epilepsy, loss of consciousness is immediate. In some individuals there is no time which can be appreciated between the aura and the attack.

So the loss of consciousness takes place before the time when cessation of circulation, if that were the cause, would have produced its effect. We cannot, therefore, look upon cessation of circulation in the brain as the cause of loss of consciousness.

CESSATION OF CIRCULATION AND LOSS OF FUNCTION.

Besides, I should call your attention—especially the attention of those who are making new investigations—to the fact that it is not at all certain that the view we all entertain is correct—namely, that loss of function quickly follows the cessation of circulation in any organ, but especially in the brain. There are facts, indeed, which seem to show that that view may be wrong. In cholera, for instance, the circulation which takes place in the brain is, indeed, almost nothing; the blood after death is exceedingly black, and, not infrequently, it is found coagulated; it does not contain any marked amount of oxygen; yet a brain so badly nourished may retain its activity for several days.

There are choleraic patients who have this lack of proper circulation in the brain without manifest elimination of mental power. I know that this phenomenon can be explained otherwise than by admitting that a certain degree of nutrition is necessary for the activity of the various tissues of the body. It can be stated that during cholera there is some poison in the blood which acts as nutriment to the brain, but that view is so absurd and unacceptable that I simply speak of it as one of the ways by which we can explain that the brain can go on acting without being nourished by the ordinary elements which are in the blood, and which give power to the tissues. It is perfectly well known that if we bleed a man or one of the lower animals to death by cutting the head off, death takes place not simply because there is no more respiration, but because the brain is entirely emptied of blood. In that case, as well as in the case in which we cut the four vessels, there is certainly no circulation in the brain, and we all admit that it is due to lack of blood that the brain ceases to act. It is doubtful, however, if that view is correct. If we pay attention to certain circumstances, we cannot but admit that the causes, whatever they are, which produce cessation of circulation in the brain, also at the same time produce a peculiar irritation which stops the activity of the brain, just as a prick in the medulla oblongata can stop the activity of the brain without changing the circulation.

Galvanization of the *par vagum* produces a peculiar action upon certain brain-cells, and arrests their activity. In view of this fact, you can easily understand that in cases of cholera, although the circulation is altered greatly, it is not accompanied by an agent which gives rise to an irritation that produces arrest of activity. While if you cut the large vessels, a rapid change is produced in certain localities in the brain, and some agent is developed which acts as an irritant and arrests the activity of the brain-cells.

I have brought this point forward to show that a broad field yet exists for investigation, not only with reference to it alone, but to many others.

MUSCULAR IRRITABILITY AFFECTED BY REST.

Thus, for instance, we all admit that muscular irritability will go on diminishing from mere rest, mere lack of use. Certainly there are many cases in which we find muscular waste when they are not used, and this wasting may be due to some other influence than mere rest; there is an irritation also in most of these cases which can change nutrition. In certain cases of hysteria, muscular irritability is scarcely changed in patients who are completely paralyzed. Once I saw a young lady whose right arm was absolutely deprived of voluntary movement, and yet the muscles of the arm were perfectly well nourished, and responded as readily to galvanization as those of the unaffected arm. In that case there had been absolute rest, except during sleep, when there may have been some unobserved movements—at least almost complete rest for two years; so that rest is not in itself sufficient cause for the production of muscular waste. Wasting comes

from changes in nutrition produced by irritation. From this cause the wasting of muscles associated with some diseases of the spinal cord is so rapid that they may be reduced to one-half their original size within the short period of a single week. Rapid change of that kind is exceedingly rare, however: yet in brain disease, if the muscles waste away, you may be sure that there is considerable irritation in the brain or secondary influence upon the spinal cord produced by disease in the brain.

LOSS OF CONSCIOUSNESS.

Now, returning to loss of consciousness, I will say that, in attacks of epilepsy as well as in syncope, lack of cell-activity in those cases is due to the effect produced by poisons such as is produced by morphine or any other narcotic remedy when rapid cessation of activity of the brain is produced; that is, arrest of activity in brain-cells is produced by disease in the same manner as it is produced by any of the narcotic poisons. It is by inhibitory influence that the activity of the cells is arrested, and this inhibition may be permanent or not, according to circumstances.

EPILEPTIC AURA—IMPORTANCE OF ITS ARREST—MEANS FOR PREVENTING ATTACKS OF EPILEPSY.

I pass now to another point. I said yesterday that there is very frequently an *aura* in disease of the brain causing convulsions. It is very important indeed to examine with reference to this point; for if you find an *aura*, it will lead to the use of a series of means which may stop an attack of epilepsy. If an attack of epilepsy can be arrested, we do more than simply arrest that attack; for, during an attack of epilepsy, changes occur which prepare the brain for future attacks; so, if one attack can be arrested, you may perhaps stop a generation of attacks. It is important, therefore, to prevent an attack of epilepsy. Now, with reference to the means of preventing these attacks. Means for preventing the occurrence of attacks of epilepsy were resorted to centuries and centuries ago. Galen insisted particularly upon the importance of ligaturing the limbs for this purpose. Suppose, for instance, there is an aura starting from the finger—a peculiar sensation or muscular spasm; Galen, and a great many physicians since his day, and even in our own times, insisted upon the application of a ligature to the arm, with the view of preventing the passage of some influence from the extremity to the brain. In reality, we succeed very frequently, by the application of a ligature to the extremity, when the aura is there, in arresting an epileptic attack; but it is not because we prevent something from going to the brain, but it is because we send something to the brain, and that something is an irritation which acts so as to arrest the irritation already there, and which, if undisturbed, would produce the convulsion. It is the same as that which occurs in diseases of the spinal cord, in which, by taking hold of the big toe, you arrest completely, in most cases at least, convulsions occurring in the lower limbs. For example, in cases of spinal epilepsy, the convulsions may be most violent, may last all day, and may recur upon the least touch of any part of the skin of the lower extremities; in those cases it is not rare at all, especially in certain forms of the disease, that drawing upon the big toe brings about a relaxation of the muscles and ends the convulsions. An arrest of the morbid activity in the cells in the spinal cord is produced by irritation of the nerves which go to the big toe, and that arrest remains sometimes for hours, and sometimes for days; but you can reproduce the same phenomena in the same patient. Whenever the convulsions exist, you can witness the influence exerted by this irritation.

As soon as I was possessed of the idea that it was through irritation exerted by the ligation, that an attack of epilepsy was cut short, I tried and found that other irritants applied to the skin produced the same effect; for example, such as extreme cold, great heat, pinching the part; in short, any irritation of the nerves in the region where the aura commences may be sufficient to arrest an attack. In fact, the patients themselves, if they have strength of will sufficient, when upon the point of having an epileptic seizure, can, by moving the limb rapidly, rotating the arm, etc., perhaps stop an attack. Any kind of irritation from the periphery may act upon the brain and arrest the morbid activity of the cells, and that irritation can succeed even when applied upon the other side where the aura exists.

As regards other forms, if the aura starts from the stomach, anything which irritates the stomach powerfully, as a violent emetic, will save the patient from an attack of epilepsy. Certain other means may also succeed, as acting upon the bowels by an enema that will produce a rapid and considerable action of the muscles. Pressure upon the bowels may bring about the same result, if the sensation starts from that region. A galvanic shock, on the contrary, will produce an attack in many cases. If the patient has simply a vague sensation of disturbance without any distinct place from which the aura arises, any means of producing irritation of the skin behind the ears, or between the shoulder-blades, may be of some service, such as the application of ice, a sharp blow from the hand, galvanic shock, etc. Any medicine which acts with great power either upon the stomach or upon the bowels, or which acts with great power upon the nervous system, may be of service in these cases.

MEDICINAL AGENT FOR THE ARREST OF ATTACKS OF EPILEPSY.

A common remedy which is employed with some benefit consists of three or four grains of the sesqui-carbonate of ammonia in a drachm or half-ounce of tincture of columbo, or gentian, or rhubarb; it is the alcohol chiefly that acts. Taken without dilution, it is rather strong, and therefore a trifling quantity of water may be added. It should be carried in the pocket, so that it can be used at the shortest warning. Running, jumping, anything and everything that produces a change in the circulation and respiration, may be of service for the arrest of an attack of epilepsy. You may not know what means will operate best upon a patient; but, recommending such means as have been mentioned, he may try one after another until he finds that which succeeds best in his individual case. In that manner, you can, perhaps, save the patient from an attack.

COMBINATION OF THREE MEDICINES.

The combination of three medicines I have found has considerable more power in controlling epilepsy than the use of one alone or of two combined. If you employ the bromide of potassium, you must employ with it the bromide of ammonium and the iodide of potassium or ammonia. A combination of these three salts acts with far greater power than when either one is used alone. It is essential always to add the bromide of ammonium if the other bromides are employed. In these cases it is also essential to employ some means of counter-irritation at the base of the brain; or, in cases of distinct aura, some means of counter-irritation at the place where the aura starts.

In those cases in which the aura starts in the finger, I have succeeded most wonderfully in controlling the attack by the application of a circular blister in the shape of a ligature to the finger itself. There is, therefore, a series of means which can prove successful in preventing attacks in these cases. As I said yesterday, if we can do so much in the way of controlling attacks of epilepsy, why should we not be able to do the same against paralysis, as epilepsy and paralysis are in many respects alike in their mode of production.

PARALYSIS AND CONVULSIONS.

Before speaking further of means of treatment, which may be of immense importance if modified successfully, I will say a little more with reference to the doctrine regarding the production of paralysis and epilepsy, and also of what I have to substitute for the generally admitted theories.

As you well know, the facts mentioned in these lectures seem to be quite in opposition to the views held by most physicians, if not by all. When paralysis exists, for instance, in the right arm, and we find convolutions upon the right side of the brain destroyed, it is admitted that the centre of the will-power for the right arm has been destroyed, and that it is very natural, therefore, that the right arm should be paralyzed. In the same manner, if we excite the convolutions of the brain, or any part of the voluntary motor apparatus—such, for instance, as arises from slight inflammation at the surface of the brain—and the patient is attacked with convulsions, it is quite natural, according to the theory generally admitted, to look upon the irritation there as having produced such convulsive movements—as having put into play the motor activity of the part where the disease exists. These two illustrative instances—the paralysis on the one hand, and on the other the convulsions—are apparently in perfect harmony with what is supposed to be established. But, as I have said many times, we find the same thing taking place, not only upon the opposite side, but upon the side corresponding with the seat of the disease. Certainly the theory cannot apply in these cases. Besides, we find the same thing occurring when the disease is in parts of the brain which are not able to produce the least movements when irritated by galvanism, and which we know, and we all agree, do not belong to the voluntary motor apparatus. For instance, disease in the posterior lobe of the brain, according to the theory admitted, should never produce paralysis or convulsions; but disease there often produces both convulsions and paralysis. We have then something taking place, and occurring very frequently, which is the reverse of what is generally admitted. What are the explanations given by physicians and physiologists of the fact which seem to be decidedly against their views? The explanations, I must say, have been very few and very timid; and, indeed, I think that I have myself, in fighting against the admitted theory, put forward these explanations very strongly. I believe that what I shall now say can at least certainly explain some of these cases. For instance, in a case of paralysis and convulsions upon one side of the body, we make an autopsy and find disease in the posterior lobe of the brain upon the opposite side. We know that disease exists at that point—we are absolutely certain of it; but, it is said, what evidence is there that there is no disease elsewhere? There may be undetected disease in the part belonging to the voluntary motor apparatus, when the brain is examined in the limited manner necessary at an autopsy; there may be disease in some other part of the brain which cannot be recognized by the naked eye; so we cannot be certain that disease does not exist, unless further examination is made.

There are many cases which at once answer this objection. If we find, for instance, that a patient is stricken with symptoms of hemorrhage in the brain; he has all those symptoms which are manifested when hemorrhage in the brain occurs, and yet had no manifestation whatever of brain disorder previous to the attack, which comes on suddenly. Besides the symptoms belonging to hemorrhage in the brain, he has paralysis in the right arm, convulsions in the right arm and face, and he dies within a few hours, as he may when the hemorrhage is limited. An autopsy is made, and we find hemorrhage has taken place into the posterior lobe. Can we admit that there was disease elsewhere? What kind of disease could have been produced so rapidly? What kind of disease could have produced such paralysis as we find in the arm, occurring just at the time the symptoms of hemorrhage occur?

It is quite certain that in such cases we cannot say that paralysis and convulsions depended upon something else than the disease we see. Why should not the same thing be true when the paralysis and convulsions are upon the corresponding side of the body? A great many cases besides hemorrhage will show the same thing. Embolism and softening may produce the same result. For instance, embolism occurs, and we have nothing except the fact that there is a plug in a blood-vessel, and the congestion and softening which surrounds the part. If that lesion exists in a part which does not belong to the voluntary motor appartus, we must admit that the paralysis, as well as the convulsions, is due to the disease seen, and not to the disease imagined and which we do not see.

Other explanations and answers to these might be given; but, as time presses, I will not indulge in them.

There is another source of explanation which is very good indeed. For instance, in those cases in which disease has destroyed the greater part of the voluntary motor apparatus in the region where it is located, and there is neither paralysis nor convulsions. How is the absence of paralysis and convulsions to be explained? It might be said—I do not say that it has been said—that paralysis does not appear because only a part of the voluntary motor apparatus has been destroyed. That may be, and that is the case sometimes when there is slight disease; but why is it that there is neither paralysis nor convulsions when a considerable part of the voluntary motor fibres are destroyed? Then it might be said, that though apparently diseased, yet the tissue remained able to act. This explanation is certainly very good, and may be true, but there is no proof of its truth. In those cases, for instance, in which there is softening following embolism, it may be that the nervous tissue remains active, although it has undergone considerable alteration.

The same may be true also in cases of tumors pressing upon different parts of the brain; there may be simple atrophy of brain-tissue, but no loss of function, however altered the structure may be. Certainly, this is a passable explanation for a number of cases. It is quite certain that nerve-fibres, for instance, have one essential element—the axis cylinder—and it may be that that part remains active, although there is considerable pressure upon it. But admit that this is true; what then of those cases in which the tissue has been so destroyed that there was no normal tissue left, and if the cylinder axis remained visible it had no cells which were not considerably altered? There are such cases, perhaps forty or fifty, in which disease

has struck parts at the base of the brain; many more in which the convolutions were involved, and no tissue left which was unaffected.

There are then two series of cases: those in which the brain tissue is completely altered, and those in which tissue is missing. There has been, however, no marked paralysis in a number of those cases, and there has been also no convulsions. It is clear, therefore, that there are a great many facts which cannot be explained by, and which are in absolute and direct opposition to, the views generally admitted.

THE THEORY BROUGHT FORWARD AS A SUBSTITUTE FOR THAT GENERALLY ADMITTED REGARDING THE PRODUCTION OF PARALYSIS AND CONVULSIONS.

What then is the theory which we are to substitute for that generally admitted with reference to production of paralysis and convulsions?

I have many times said that paralysis and convulsions appear through the same mechanism, however different one symptom is from the other. If you admit, as I do, that the cells in the gray matter of the brain are endowed with the same function, the explanation of the production of paralysis and convulsions is very plain. For instance, the cells which are employed in moving the right arm are scattered in the brain, as well as are the cells which serve for any special function of the brain. These cells being so scattered, and belonging to one function, are connected one with the other by fibres, so that they may act with harmony.

Suppose that, the cells being so distributed, an irritation comes from the bowels; it is transmitted to certain parts, and instead of going to certain other parts, it meets, in the part to which the irritation is transmitted, cells which are then employed in the production of voluntary movements, or those which are able to produce movements by reflex action. These are two distinct kinds of cells, as many facts show. If that irritation reaches cells which are employed in producing voluntary motor action of the arm, for instance, it produces the same effect as does irritation by galvanism of the nerve going to the arm at any point at which it can be reached in the neck—the cells are stopped in their action, their activity is suppressed, and paralysis occurs.

If, on the contrary, an irritation, starting from the bowels, acts upon those cells which are able to produce reflex movements—whether these cells are situated in the base of the brain or elsewhere—those cells are put into play and convulsions occur; that is, reflex movements of a convulsive character.

What takes place when irritation starts from the bowels is the same as that which occurs when disease in the brain exists. An irritation starts from the posterior lobes, for instance; it spreads into the brain, and if those cells, wherever they are, which serve for voluntary motor movements, are acted upon, they are exhibited in their power to produce motion, and there is paralysis as the ultimate result of the irritation. If, on the other hand, the irritation starts from the same place, and reaches cells which are connected with the production of reflex movements, convulsions will appear. In both instances we have the same elements; there is an irritation starting from some place, and travelling to some cells, and there either inhibits their activity or produces reflex movements—produces either paralysis or convulsions. The irritation may inhibit the action of the cells which serve in the expression of ideas in speech, and give rise to aphasia.

I have not time to dwell further upon the opinions which I hold, in order that you may understand them better; but I will say that paralysis or aphasia, or loss of function in any part of the brain, can occur by attacks as well as convulsive movements can occur in attacks.

You can now easily understand how an irritation operates to produce attacks of paralysis, aphasia, amaurosis, etc., and it can be easily seen that when the paralysis persists there is also something of the same kind of action. The objection to this would be: How is it such power can be kept absolutely inactive for so long a time as it exists in paralysis which is persistent? We know already that, in many cases of paralysis produced by organic disease of the brain, there has been sudden change for the better; and there are cases in which rapid cure has occurred, although the organic cause which has produced the paralysis has persisted. In fact, fluctuations in the loss of function in any part of the brain are frequently observed, and these fluctuations may go on to such an extent that the patient may be cured very rapidly, and in certain cases very suddenly. If there was paralysis or loss of function because of the existence of the organic disease, the lesion persisting, the effect would persist. But it is not so. It must be that something exists which ceases to exist at the place where the effect is produced.

We know that in animals we can arrest the activity of those cells which serve for the production of sight, and the activity of cells serving to all the mental faculties and the will. The activity of the cells employed in any of the functions of the brain can be suddenly arrested by certain irritations. In cases, for instance, of hemorrhage into the upper part of the spinal cord, without possible pressure upon the brain, there may be immediate loss of consciousness. There are two such cases upon record. Certainly there was loss of activity of all the functions of the brain as regards power of motion and sensation, all will-power, and that from an irritation which started at a distance from the brain. Certainly, also, there was no pressure upon the brain in these cases. In these cases, also, consciousness was restored after a time.

Sometimes we produce death rapidly, and destroy, therefore, all the activity of the brain by a mere prick.

We can also produce a persistent amaurosis by a mere prick of the restiform bodies, and the amaurosis appears instantaneous. There is no direct connection between these bodies and the eye, yet the amaurosis persists while the animal lives; and I have had an animal that lived more than two years after the production of such a disorder of vision.

All will-power and all sensibility also may be destroyed by a mere prick in certain parts. If, for instance, the spinal cord in animals be pricked in the dorsal region, it is found that sometimes there is produced a cessation of the activity of cells there, and we have anæsthesia upon the opposite side and loss of will-power upon the corresponding side.

We find in cases of disease of the brain that the pulse is weakened and is exceedingly irregular as long as the patient lives; it is an arrest of the action of the heart while the disease exists in the brain. If the action of the walls of the heart can be so modified, and persistently modified for months and months, the same thing may exist for different parts of the brain.

In the same manner, reflex activity may be arrested for months and months, as, for instance, the cell activity which controls the contraction of the sphincters of the bladder and rectum, and the loss of control over the action of these parts may be permanent. The same thing may take place for the cells which control voluntary movements.

CONCLUSION REGARDING TREATMENT OF PARALYSIS AND CONVULSIONS.

From what has been said, what are the conclusions reached regarding treatment? Upon this subject I have time to say only a few words. The leading principle is that you are to obviate the effects produced by disease in the brain by means of irritation upon the skin in the parts which are affected. Suppose the arm to be paralyzed, then the irritation is to be applied so as to restore the activity of those cells which serve for voluntary movements of that part. The same means which have been suggested as those to be applied against an aura are to be applied against paralysis.

IMPROVED METHOD FOR DETECTING LEUKÆMIA DURING ITS EARLY STAGES,

AND FOR ENUMERATING THE WHITE BLOOD-CORPUSCLES IN DISEASE GENERALLY.

(Read before the New York State Medical Society.)

BY JOSEPH G. RICHARDSON, M.D.,

CHAIRMAN OF THE DELEGATION FROM THE PENNSYLVANIA STATE MEDICAL SOCIETY; PROFESSOR OF HYGIENE AND DEMONSTRATOR OF HISTOLOGY IN THE UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA.

LEUKÆMIA or Leucocythemia, as it was called by its discoverers, Virchow and Bennett respectively, on account of its characteristic and remarkable lesion, increase of the white or colorless corpuscles of the blood, has, from the time of its first detection thirty-two years ago, been a subject of much interest and speculation. So much has this been the case that it seems an astonishing fact that, notwithstanding the attention which it has received the world over from scientific physicians—notwithstanding it appeared even to its first discoverers to hold the key to some of the most important and interesting problems in relation to the origin, development, and destination of those supremely vital constituents of our organisms, the red and white blood corpuscles, researches through the period of thirty years have thrown but little light upon the nature, the causes, or the early symptoms of this remarkable malady, and any successful mode of treatment still remains quite unknown.

The reason of this obscurity which hangs about the origin of leukæmia, is, I think, chiefly to be found in the want which every physician (who employs, as all should do, the microscope as a constant aid to diagnosis and prognosis) must have experienced, of some easy, practicable method for enumerating the red and white corpuscles—a process which any of you who may have tried the experiment will doubtless agree is, if undertaken in the ordinary and obvious way of counting them as they lie in rouleaux in a drop of fresh blood, both troublesome and uncertain. Another difficulty which obstructs most exact observations in cases of suspected leukæmia, except in hospital wards, is, that a drop of blood spread out in the usual mode upon a slide beneath a thin glass cover, only remains in a suitable condition for investigation for half an hour or an hour, and therefore, if collected at a distance from a physician's office, is nearly or quite worthless before it can be submitted to microscopic examination, even supposing that other calls upon our time and attention could be made to give place to this research.

From these various causes it has usually happened that practitioners of medicine have been induced, often compelled, to postpone the thorough investigation of the blood, in cases of supposed leukæmia, until decided general symptoms manifest themselves, and, unfortunately, until the curable stage—if there be any such period to this malady, which, if it does exist, is as yet unknown to medical science—has passed by.

The object of the present essay is to bring before you a simple and easy method which I have devised for the purpose of obviating the deterrent influence of these obstructions to the frequent and early examination of all cases, when there is ground for the least suspicion that any increase of the white blood-corpuscles is occurring, and I hope thus to pave the way for a much more complete knowledge of leukæmia, as well as other affections during which changes in the number of the leucocytes take place, and perhaps for very important discoveries in regard to the origin and destination of the cellular elements of the circulating fluid.

My plan of accomplishing this desideratum will probably, however, be more easily understood in all its details if we take a brief preliminary survey of what has already been accomplished by previous investigators in this department of microscopic research.

Among the older methods for determining the globular richness of the circulating fluid, as referred to by Henri Bonnet in his recent monograph upon the white corpuscles of the blood, Paris, 1876—that of spreading out the fresh liquid in a thin film between a slide and cover, and then counting the white globules in a series of given areas, say quarter-millimetre squares—is one of the earliest. The objections to this plan are, briefly: 1st, that it is almost impossible to secure equal bulks of blood in equal areas of film; and 2d, that a variable percentage, perhaps one-half or even two-thirds of the leucocytes, are hidden from view by the rouleaux of red discs, and so escape enumeration. The second mode of determining the ratio of the two kinds of corpuscles, and that adopted by Hirt, Moleschott, Virordt, Welker, and others, is to dilute the blood with amniotic liquid, filtered liquor sanguinis, or artificial serum, and then count directly the whole number of red discs and of leucocytes in certain measured quantities of the mixed fluid. This plan, whilst much more exact than the former, can never become generally useful, because, as remarked by Malassez, when employed upon sufficient quantities of blood, "elle devient alors d'une exécution bien difficile en raison du temps énorme qu'elle exige et de la fatigue extrême qu'elle cause; il suffit d'essayer une seule fois cette méthode pour s'en convaincre; et je puis dire qu'il n'y a guère lieu d'espérer acquérir par la pratique plus de rapidité dans la numération et plus de résistance à la fatigue." Furthermore, as this author observes, such a plan gives very incomplete results, since they are only relative and may represent an apparent increase in the white blood-corpuscles as I have myself noticed, when in reality both they and the red discs are diminished in number, when this diminution affects the red corpuscles to a greater extent than the white.

The method which Malassez has so ingeniously devised, and which is now known by his name, is practised, as I need scarcely remind you, by the aid of an apparatus for mingling a small quantity, say the one-tenth of a drop of blood, with ten drops of artificial serum, and then introducing a minute portion of this

mixture into a capillary tube of known capacity, and counting the corpuscles, red and white, under the microscope in an accurately measured length of the tube. Hayem and Nachet's improvement upon Malassez's plan substitutes a glass cell of the depth of one-fifth of a millimetre for the capillary tube.

These modes of enumeration have added very much to the precision of our observations in regard to variations in the sum of the red discs, and have already given a new impetus to our study of the vital fluid; but as respects the white globules, they are both subject to an obvious cause of fallacy, so that, even if they were much more convenient, and could be practised without expensive apparatus, they would leave much to be desired. The error to which I refer as almost certain to vitiate our conclusions concerning the white globules of the blood, when thus enumerated, depends on the strong tendency which these cellular elements possess to become attached to glass, and, doubtless, to other surfaces with which they come in contact. This proclivity, observed by every student who irrigates a specimen of fresh blood with water beneath the microscope, is not met with in the red discs, and must therefore lead to incorrect estimates of the proportion existing between red and white corpuscles of blood passed through capillary tubes, to the inner surface of which the leucocytes adhere, whilst the red discs do not.

The idea of counting the white corpuscles in a thin film of *dried blood* first occurred to me during an examination made for a member of the profession here in Albany, Dr. F. C. Curtis, whose interesting report of the case appears in the *American Journal of the Medical Sciences* for October, 1876, p. 405.

In the course of my observations upon the blood of different nations as represented at the Centennial Exhibition in Philadelphia, year before last (Vide *Am. Jour. of Med. Sciences*, Jan., 1877), I had occasion to measure a great number of the red discs as spread out by Prof. C. Johnson's method, in thin layers of blood drawn from the different Commissioners, and dried upon glass slides, and I was much struck with the ease and certainty with which the white corpuscles could be detected, discriminated from the red, and enumerated, also in healthy blood. As a consequence I was led to experiment further upon cases of true and of suspected leukæmia, with a view of utilizing for the benefit of the profession this simple fact.

After long consideration and numerous trials, the following plan was elaborated. In the first place, to obtain and prepare your specimen, you require a clean sewing needle (No. 6, sharp, answers best, but any kind will do), and two ordinary microscope slides (preferably of plate glass with ground edges), one of which should have a blank label pasted near its extremity. Having punctured the middle or ring finger of your patient by a quick stab with the needle, and squeezed out a drop of blood, about the size of a large pin's head, such as I show you here, touch the apex of this drop to the surface of your labelled slide near its end, and then immediately spread it out by means of the edge of your other glass slip applied to the portion of the blood-drop which adheres to the first slide, and whilst holding slide No. 2 at an angle of 45°, drawing it rapidly along the flat surface of No. 1 in such a way as to leave a faint reddish film equably distributed over the latter. In half a minute or less your preparation dries, and, if protected from dust and moisture, may be examined any time between this and our next Centennial in 1976.

After writing the name of the patient, with the date at which it was obtained, upon the label (and this ought always be done at once), the specimen should as soon as convenient be simply inspected under a power of 200 diameters. This preliminary examination may be made by any one having even a rudimentary acquaintance with the use of the microscope, and by it a mere tyro can determine, on comparing it with a similarly prepared sample of blood from a healthy person, the presence or absence of any marked change in the ratio of the red and white corpuscles. In order, however, to establish the *amount* of alteration, should any exist, the sample of blood thus prepared ought to be submitted to some skilled microscopist for further investigation.

For the purpose of facilitating the enumeration of the colorless globules, and ascertaining their proportion to the red discs, without undertaking the almost interminable task of counting all the latter contained in a given area of the film of blood, I would suggest the following scheme:

Provide, in the first place, a stage micrometer ruled in $\frac{1}{4}$ mm., upon glass about half the thickness of an ordinary slide. Lay your blood specimen upon the stage of the microscope, find an area of $\frac{1}{4}$ mm. in width, by 5 mm. in length, where the corpuscles are spread so thickly as to almost touch, and yet are in no case superimposed upon each other. Such an area as this can generally be met with quite readily, and when discovered lay upon it your $\frac{1}{4}$ mm. micrometer face downwards, so that its lines can be seen (somewhat indistinctly perhaps) at the same time the blood-globules are in focus. Secondly, procure an eye-piece micrometer with very coarse divisions, such as this I here exhibit, the lines of which are $\frac{1}{16}$ of an inch ($\frac{1}{16}$ of a millimetre) apart, and place it in your "A" eye-piece, so that its lines divide the field of view into from 8 to 12 transverse bands, each about the width of 5 red blood-corpuscles, as seen with the aid of a $\frac{1}{4}$ or $\frac{1}{5}$ objective.

These little pieces of apparatus are merely aids to the accurate counting of the red discs, which operation should be performed very precisely with the eye-piece and objective you propose to use in subsequent investigations, and their number carefully recorded as a unit of enumeration for the white corpuscles. This counting I have found to be most readily accomplished by adjusting the camera lucida, drawing on white paper the outlines of the field of view with both the transverse lines of the eye-piece micrometer, and the vertical lines of the superimposed stage micrometer; and then counting the individual globules in a band at a time, dotting each corpuscle as it is enumerated upon your paper with a lead pencil, so that none may be missed, and none may be counted twice.

In order to attain perfect accuracy, it will of course be necessary to count the red corpuscles as well as the white ones in each successive field; but as even such a task would only yield approximative results (on account of the necessary inequality with which both kinds of globules are spread out upon the glass), it is not worth while to undertake it. For practical purposes we may consider the number of red discs in each field of a given lens and eye-piece, where these discs nearly touch, but are not piled upon each other, as identical, and *the sum of the white corpuscles observed in ten successive fields answering this description, divided into ten times the number of red discs counted in one such field, shows us the ratio of the white to the red corpuscles.* For example, with the $\frac{1}{4}$ inch objective and "A" eye-piece of my Powell & Leland's stand, I find the field of such a single layer of blood as that above described shows me 3,000 red discs, and that ten fields display about 100 white globules. Dividing

now 100 (the number of leucocytes) into 30,000 [the number of red discs in ten fields (each $\frac{1}{4}$ a millimetre wide)], I obtain the fraction $\frac{100}{30000}$, or, reducing this to its lowest terms, $\frac{1}{300}$, as the proportion which the white bear to the red corpuscles.

In counting the white globules it has seemed to me advisable to first look carefully at each corpuscle within the upper transverse band, as marked off by the eye-piece micrometer above mentioned, then to scrutinize all those in the second band, and so on until all are inspected. In doubtful instances, the leucocytes may generally be distinguished from the red discs by turning the fine adjustment screw so as to raise the lens a very little, when the white corpuscles usually display a peculiar fatty lustre which suffices for their discrimination. Care must be taken to avoid mistaking unusually large aggregations of the (fatty?) *molecules* of the blood for leucocytes.

Sometimes, in examples of profound anæmia, it is difficult, or even impossible, to obtain satisfactory fields of the kind I have described. In such instances, our only resource is to select an area where there are ten contiguous fields over which both kinds of corpuscles seem equally distributed, and then, counting the red discs in one field, and the white globules in all, proceed as before directed.

This method is most readily applied with the aid of a mechanical stage, but may be employed if sufficient care is exercised by an individual having command of any one of the cheaper forms of the microscope, provided it affords sufficient amplifying power (say 200 diameters), with good definition.

Having thus, by my improved method, determined the true ratio of the white globules to the red discs, it becomes an easy matter to calculate the actual number of the leucocytes in each cubic millimetre of blood, after we have determined by the aid of Hēmatimētre, of Hayem & Nachet, or of Malassez, the number of the red corpuscles in that quantity of the circulating fluid.

This little piece of apparatus, which I here exhibit, is merely a very ingenious contrivance for mingling an accurately measured fraction of a drop of blood with 100 times its bulk of serum, and then counting the red and white corpuscles in the $\frac{1}{4000}$ of a cubic millimetre of this mixed fluid, measured under the microscope with scrupulous exactness. For example, $\frac{1}{20}$ of a cubic millimetre of my own blood, diluted with $\frac{1}{4}$ a cubic centimetre of artificial serum, contains in each $\frac{1}{4000}$ of a cubic millimetre of the mixed liquid about 112 red corpuscles; multiplying this number by 500, we obtain the number of red discs in 1 cubic millimetre of the diluted blood as 56,000. But as the fresh blood was diluted with 100 times its bulk of serum, we must again multiply this sum by 100, to find the number of red corpuscles per cubic millimetre of pure blood, and thus we obtain the product 5,600,000 as the globular richness of this particular specimen.

It is obvious that a determination of the total number of the red discs is, in general, a necessary preliminary to arriving at a definite conclusion in regard to whether the leucocytes of the blood in any particular case are actually increased in number; because if, for example, the red discs are diminished to one-fourth of their usual amount, whilst the white corpuscles are unaltered in quantity, we would be apt to conclude, without this precaution, that four times the normal number of leucocytes were present. In a recent investigation of my own, made upon a case under the observation of Prof. Wm. Pepper, in the Philadelphia Hospital, and which he kindly permits me to refer to here in advance of its detailed publication, the ratio of the white to the red corpuscles was found to be 1 to 56. On this account a previous attendant had diagnosed leukæmia, but upon counting the red discs by Hayem's apparatus I found the circulating fluid so impoverished as to contain only 810,000 corpuscles to the cubic millimetre instead of 5,000,000, which is about the average in health. Such a change is a reduction to about one-sixth of the normal number, and if we could return to this man's blood the 4,200,000 red discs he had lost it is plain that the usual proportion between the white and red corpuscles, viz., 1 to 336, would be restored, and therefore that the actual number of leucocytes was unaltered. It seems to me difficult, by the way, to avoid the deduction, even from this single instance, that the general laws of our organisms which regulate the number of the white blood-corpuscles must be *entirely independent* of those which control the total number of the red discs, because here we have an example of the latter so profoundly reduced as to fall below one-sixth of their normal quantity, whilst the leucocytes remain entirely unchanged in amount.

In connection with this subject of counting the red corpuscles by means of Hayem's apparatus, I desire to put on record my dissent from the claim to strict accuracy impliedly made for it by some recent observers. In my experience, at least, the areas of tenths of a millimetre square vary, in different parts of a specimen of healthy blood, so much that they sometimes—rarely, it is true—contain as few as 104, on the one hand, and as many as 128 on the other. Now those figures represent 5,200,000 and 6,400,000 red discs per cubic millimetre respectively, and since the corpuscles are never arranged in rows, like grains of corn in a field, but are scattered irregularly upon the glass, like wheat sown broadcast, or rather, like chestnuts dropped thinly or thickly from a tree, just as pure chance dictates, I think we must accept the possibility of accidental error (as admitted by Malassez in his original papers) of at least 100,000 corpuscles on either side of the truth. Moreover, unless the observer makes an absolutely honest and impartial examination, rigidly refusing to allow himself to count rich fields if he has a theory of plethora, and poor fields if he has an anæmic theory to support, I do not consider that his results are conclusive within 500,000 corpuscles per cubic millimetre either way—that is, in the direction of deficiency or of excess.

Although my method, as described above, has been chiefly applied as yet to the diagnosis of leukæmia, it has, as I conceive, a far wider application, and may become in the near future a very useful aid, only inferior in importance to the pulse and temperature in the recognition and prognosis of various diseases, particularly those in which active inflammatory processes take a prominent part. Especially will this be the fact if, as is claimed by Malassez, Bonne, and others, in cases of abscess, typhoid fever, scarlatina, in parturient women, etc., etc., rapid increase in the number of white globules (leucocytosis of Virchow) during the febrile excitement, or at least of pyogenesis, followed by an equally rapid decrease during convalescence, occurs.

Finally, it seems probable that extremely valuable facts in the domain of therapeutics may be obtained by investigations into the changes as to number undergone by the red and white corpuscles during the administration of tonics, alteratives, and so forth, as commenced by Drs. Cutler and Bradford, of Boston, in healthy and diseased conditions of human and animal organisms.

MEDICATED COTTON-WOOL IN THE TREATMENT OF EAR DISEASES.

By SAMUEL SEXTON, M.D.,

NEW YORK.

In treating chronic purulent inflammation of the middle ear, it is often desired by the surgeon to apply external medicaments which do not increase the humidity of the parts, as moisture is well known to be a promoter of cell-proliferation and its consequences, namely, suppuration and polypoid growth. This also applies to like conditions of the meatus auditorius externus, which may exist as primary affections, or, as is mostly the case, as a sequence to the middle ear disease. For this purpose powders have long been recommended by aurists, but they are objectionable for many reasons, chiefly on account of the difficulty attending their application and removal; and, furthermore, when saturated with secretions, they become heated and are likely to act as a poultice in the meatus if not frequently renewed.

Such objections do not apply to the use of water-absorbing cotton-wools, and they have, therefore, been gradually growing in favor. After more than a year's experience I have adopted the following method of using wool in the cases under consideration: The cotton-wool selected for use is prepared by such washings as are necessary to free it of oils, etc. When dried, it absorbs water like a sponge, and is known as water-absorbing cotton-wool.

After syringing the ear, the meatus and parts beyond are dried by passing a suitable brush formed by winding some of the wool tightly on the end of a vulcanite carrier made for this purpose.

The meatus being dried is now ready to receive the medicated wool.* This is prepared for introduction into the meatus by being rolled rather loosely upon the end of the carrier, the diameter of the roll being usually a little smaller than that of the meatus, and about two to three centimetres long for adults. It is then gently inserted into the meatus down to the diseased parts, when the carrier is withdrawn with a twisting motion, leaving the wool in the meatus.

It is now frequently advisable to urge the wool farther down, which may be done either with the blunt end of the carrier or by seizing it with Gruber's rectangular dressing forceps. The wool can be left in the meatus as long as desired, as its presence is usually well borne by the patient; but if we use a strong medicament, it is best to leave it but a short time. Mild astringents, however, can remain for ten or twelve hours if the discharge is not great. Where there is much discharge the wool should be removed as fast as it becomes saturated, and this can be done by the patient or his nurse as readily as the thorough instillation of medicines in solution.

The medicated wool can be advantageously used in some acute cases where the secretion is free. I have found the following formulæ convenient:

Borax, 20 per cent.; sulph. zinc, 2 per cent.; sulph. zinc, 5 per cent.; tannin, 5 per cent.; salicylic acid, 5 per cent.; alum, 3 per cent.; alum, 5 per cent.; ferri subsul., 3 per cent.

The salicylic acid preparation has been found beneficial in purulent cases where there was an offensive odor.

In cases where polypoid granulations are a feature I use the ferri subsul.

Iodine, carbolic acid, and other remedies which are difficult to keep ready prepared, may be used by dipping plain wool into solutions of them at the time of using.

These preparations may now be had of Messrs. Caswell, Hazard & Co.

12 WEST 35TH STREET.

* The wool is medicated by saturating it with the proper solution of the medicine to be used. The wool, when dried, is ready for use.

Progress of Medical Science.

INJECTION OF CARBOLIC ACID IN HÆMORRHOIDS.—Prof. J. H. Pooley reports three cases of piles treated by the subcutaneous injection of carbolic acid. Five or six drops of the pure acid were used, and care was taken to carry it well into the substance of the tumor. The immediate effect was a severe but momentary pain, followed by a remarkable shrinking and hardening of the tumor. From this out there was absolutely no pain, the piles quickly sloughed, and the patients made rapid recoveries, all vestiges of the disease being removed in a week or ten days. In the first case but one injection was made, in each of the others four were required. The two last cases were acutely and intensely inflamed, but the only unpleasant effect was the odor of the slough. Prof. Pooley prefers the pure to the diluted acid, because it produces a more thorough coagulation of the blood and consolidation of the tissues, thus lessening the danger from detached pieces of coagulum, which was pointed out when this method was first introduced. Dr. Pooley has heard of a case in which the injection produced a severe spreading inflammation, and he ascribes it to one of two causes: "First, the too dilute and, therefore, irritating rather than coagulating and destructive character of the injection; and, second, the oblique insertion of the needle, thus conveying it into the areolar tissue outside of the pile, rather than into the tumor itself. Therefore, in addition to making use of the strong acid, I was very careful to insert the needle-point vertically to the surface, and to carry it well into the substance of the hemorrhoids." This treatment is recommended for partly internal and partly external piles, and for protruded and inflamed internal piles.—*Toledo Medical and Surgical Journal*, November, 1877.

ICHTHYOSIS, OR PSORIASIS OF THE TONGUE.—Although the connection between ichthyosis or psoriasis of the tongue, and cancer of that organ is now well established, it is useful to return to a question which has so practical a bearing upon surgical treatment. One of the most recent contributions to the subject is that of Nedopil, of Vienna, who, in an exhaustive review of what is known on the subject, adds several facts which are important, if not novel. He believes the ichthyotic condition (or, as he prefers to style it, psoriasis) to be the result of a chronic irritative process in the subepithelial layer of the lingual mucous membrane. Owing to this there is a greatly increased development of epithelial cells from indifferent cell-tissue, so that the layer of stratified epithelium increases greatly in thickness, an increase not owing to the proliferation of cells *in situ*. The transition to actual cancer-growth is easy; it requires only the growth of epithelial elements into the deeper layers of the mucous membrane, instead of upward towards the surface, to transform the simple into the malignant formation. This, in brief, is the sum and substance of this writer's views as to the pathogenic relations of lingual epithelioma and ichthyosis, based upon the examination of fifteen cases. As regards

the etiology, a long-continued use of any active irritant is said to favor the production of lingual or buccal psoriasis, such as highly-spiced foods, strong drinks, and, above all, tobacco, and tobacco-smoke, rather than the substance itself, for, as compared with the smoker, the chewer of tobacco is remarkably free from the complaint. Nedopil asserts, moreover, that cigarette-smoking is the most harmful of all methods of taking the baleful weed, and as tobacco-smoke contains such irritants as butyric, acetic, and phenic acids, as well as carbonate and acetate of ammonia, he thinks that the evidence of local irritation in cases of the tongue in smokers is as marked as that of cancer of the scrotum in chimney-sweeps. The male sex and advanced age are predisposing causes, and as to the duration of psoriasis linguæ before the appearance of the cancer, this author agrees with others in assigning it as long a period as from fifteen to thirty years. As regards treatment, however, he points out that all internal and external remedies are powerless to cure or even to arrest the psoriasis when once developed, and that the abstention from tobacco-smoking, etc., is equally inefficient. The frequency with which the affection is followed by cancer is notorious, and he does not hesitate to advise the excision, at as early a date as possible, of the milky patches of psoriasis, where these are so circumscribed as to permit of such a procedure.—*The Lancet*, Sept. 1, 1877.

ADAMS'S OPERATION IN ANCHYLOSIS OF THE HIP.—This is the third of a series of cases in which Mr. Bryant performed Adams's operation for relief of anchylosis of the hip. The anchylosis resulted from disuse while suffering from necrosis of the tibia. The necrosed bone was removed Nov. 5, 1875, ten months after the accident that led to the disease. The femur was divided on the 23d of the same month. The following is from notes on the case taken by Mr. Poland:

"*November* 23.—Chloroform having been administered, a small incision, half an inch long, was made with a long tenotomy-knife above the great trochanter of the left side, through the soft parts down to the neck of the bone, and then with a saw the neck of the femur cut through, and the thigh straightened. The Sartorius muscle was divided at the anterior superior spine subcutaneously, and the small wounds covered with a pad of lint. A large outside splint, with foot and cross-piece, was applied, and a morphia injection given, which eased the pain, but he was a little sick after the operation." Both wounds did well. He complained of great pain in his back for a few days, but this soon wore off.

"*February* 10, 1876.—He was sent down to Bognor. There was still a little discharge from the right leg.

"When at Bognor the wound over the tibia completely closed. He could walk well, the parts about the hip having firmly consolidated."—*The Lancet*, November 17, 1877.

EXCISION OF THE SPLEEN.—Another case of splenotomy has been put upon record by Mr. H. L. Browne. After all the dangers had been thoroughly explained to the patient, the operation was performed on Feb. 23, 1877, in the West Bromwich Hospital. There were no adhesions, nor was there any distinct pedicle. Four large arteries were met with, which were secured by double ligatures before division, and also their veins. There was no hemorrhage. The lad rallied very well from the chloroform, but five hours afterwards died suddenly. There was no hemorrhage after the operation. The tumor, which was found to be a simple hypertrophy of the spleen, was eighteen and a half pounds in weight.

No theory of the cause of the disease is offered. The lad had leucocythemia. There were no other glandular affections. The youth of the patient (20 years), the almost certainty of a splenic tumor being non-malignant, the absence of other disease, and the fact that the patient was dying, and would have died in a few days from the pressure alone on the viscera and blood-vessels by the weight of the tumor—these are some of the strongest reasons why the operation was and should be performed.—*The Lancet*, Sept. 1, 1877.

SYPHILOMA OF THE KIDNEY.—An extremely rare lesion of the kidney, viz., syphiloma, was met with by Prof. Jäderholm in two medico-legal post-mortems, and the preparations were placed in the hands of Prof. Key for examination. In the first case, that of a syphilitic prostitute who died suddenly, and whose body presented other characteristic specific changes, half the kidney was the seat of between 20 and 30 partly isolated nodules, firm, dry, grayish-white or reddish-gray, surrounded by a gelatinous, grayish-white zone, and sharply separated from the surrounding renal parenchyma. They appeared to be of recent occurrence, though the finer details could not be determined with certainty, as cadaveric changes had already occurred. The larger nodules presented, in general, a centre of cheesy degeneration. Microscopic examination showed the changes usual in syphiloma, as are seen in syphiloma of the liver, with which the nodules also corresponded macroscopically.

In the other case, that of a man 31 years of age, the syphilomatous nodules were quite numerous, and were mostly in the pyramids. (In the previous case the new formations were partly on the surface and partly in the cortex or pyramids.) They were not so firm and dry, but softer, undergoing solution, with a jelly- or mortar-like consistence. External to the syphiloma, the renal substance was undergoing sclerosis, with atrophy.

In connection with the above-mentioned preparations, Prof. Key showed the kidneys and heart taken, by Prof. Bruzelius, from the body of a sailor who died suddenly in the street. There was found complete atrophy of the lower portion of both kidneys, with a sharp line of separation from the remaining portion of the kidneys, which appeared macroscopically to be healthy. This atrophy is thought to be characteristic of syphilis, and the previous syphilomata were useful in elucidating the manner in which such atrophy occurs. The presence of syphilis in this case was also shown by the heart, which was hypertrophied, and its muscular structure replaced, in both halves, to a great extent by cicatricial, broad, ramified connective-tissue formations. In these connective-tissue formations, as well as elsewhere, small, grayish-white or grayish-yellow syphilomata occurred.—*Svenska läkaresellsk. förhandl.* S. 35, 85. *Hygiea*, 1877; and *Nord. med. ark.*

LACTIC ACID AS AN HYPNOTIC.—Lactic acid, originally discovered by Scheele in fermented milk, is one of the products of the metamorphosis of tissue in muscle, and was suggested by Preyer as an hypnotic on theoretical grounds. Dr. Mendel has lately carried the theory into practice, giving from one to two drachms at a dose in the form of lemonade sweetened with sugar, and diluted, or in double those doses as an enema, neutralized with the same quantity of carbonate of soda, since in its pure state it acts as an irritant to the intestine. It is said to act best when the conditions preventing sleep are of a mental nature, whilst it is inoperative if the sleeplessness is occasioned by pain.—*The Lancet*, Dec. 8, 1877.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, March 2, 1878.

INSANE ASYLUM BUILDING IN THE UNITED STATES.

Two striking pamphlets, by Dr. H. B. Wilbur, of Syracuse, N. Y.—the one a paper read before the Conference at Saratoga in September, 1876, on "Governmental Supervision of the Insane," and the other in the nature of a report on "Buildings for the Insane," read before the same Section of the American Social Science Association in September, 1877—form such a suggestive appendix to our recent discussion of "Insane Asylum Management in the State of New York," that no apology is needed for calling the attention of the medical profession to their remarkable disclosures; disclosures which charge insane asylum management in the United States with glaring extravagance of expenditure, as well as with incompetence in the strictly scientific aspects of medical superintendence.

From a tabular statement prepared by Dr. Wilbur, which can be readily corrected if he is in error, it appears that within the last twelve years, twenty insane asylums have been erected in this country, with an aggregate capacity of 9,875, at an aggregate cost of $19,506,000. The table is worth copying, not only as a suggestive exhibit in brief of the finance of insanity, but as a preface to more specific examination of some of the objections to our present system of providing for this unfortunate class, urged by Dr. Wilbur. It is as follows:

Worcester, Mass.	450	$1,250,000
Danvers, Mass.	450	1,600,000
Middletown, Conn.	450	600,000
Hudson River Hospital	600	2,000,000
Buffalo, N. Y.	500	1,800,000
Homœopathic, N. Y.	300	900,000
Morristown, N. J.	800	2,500,000
Danville, Penn	500	1,000,000
Maryland	300	803,000
Kentucky	375	162,000
Ohio State Asylum	900	1,800,000
Athens, Ohio	690	950,000
Kalamazoo	580	653,000
Auer, Illinois	450	584,000
Oshkosh, Wisconsin	500	552,000
Iowa State Asylum	800	600,000
Minnesota	500	480,000
Missouri	250	209,000
Nebraska	80	113,000
California	900	1,000,000
	9,875	$19,506,000

It is evident from this statement that, exclusive of furniture and other appliances, the first cost to the tax-payers of the United States, of providing shelter for the indigent insane, has, for the last twelve years, averaged about $2,000 per capita, which, according to the most recent statistics, is considerably in excess of the amount invested in dwellings by the average householder. Indeed, if a family may be supposed to consist of five persons, the shelter of a single insane pauper costs more than six times the amount per capita necessary to provide that first element of a home for the earning and tax-paying classes of the community. This extraordinary disparity is mainly traceable to extreme extravagance in building in the older and longer established States. In Missouri, for example, the cost of building for the insane has been only about $800 per capita; in California, about $1,100; in Minnesota, $960; in Wisconsin, $1,100; but in Iowa, $2,000. In this State, three asylums have been (or are being) erected, at an aggregate cost of $4,700,000, with a capacity for 1,400 patients. This represents a per capita outlay of $3,357. In New Jersey, 800 insane have been provided for at an outlay of $3.125 per capita; and the two asylums at Worcester and Danvers, Mass., costing in the aggregate $2,850,000, with a capacity of 900, tax that State $3,166 for every indigent pauper admitted to their wards. As, according to Dr. Wilbur—and Dr. Ordronaux as well, by the way—the number of the insane relative to the general increase of population is constantly increasing, and as (which is more to the point) the number of the indigent insane has augmented of late years far beyond the natural increase of population, it is practically impossible that any State should provide shelter for this class at the extravagant rate which has so far prevailed. If, as Dr. Wilbur intimates, the American Association of Superintendents is answerable to the community for such a system of building, and proposes to provide for the insane, curable and incurable, in institutions of which these are the type, that Association has placed itself in a position to become discredited before the people the very moment that potent engine of public opinion, the newspaper press, takes occasion to give publicity to the facts and figures of the pamphlet. Nor can such an issue be long delayed. Already there is a popular murmur of dissatisfaction, led and directed by some of our ablest publicists and physicians,

which must, in the nature of things, soon be caught up and investigated by some clever journalist on the *qui vive* for something of public moment. Fairly to estimate the stupendous extravagance implied in the preceding table, the medical reader has only to select any ten of the most expensive hotels in this country, and to assure himself of the fact that, while these luxurious resorts of the travelling public cost at a liberal calculation not more than $1,500 per guest, our asylums for insane paupers cost more than twice that amount per patient.

Medical protests against such an extraordinary outlay have not, of course, been wanting; for the majority of medical men are not possessed of the expert's idea, that it is the paramount purpose of a State to build expensive asylums, with elegant and luxurious quarters for the medical staffs thereof. At a recent legislative investigation as to the expenditure of public money, in the case of one of these asylums, competent medical experts testified "that buildings at a cost of a thousand dollars a patient, with no expense for mere display, would still afford all that is essential or really desirable for the treatment of the insane, and that not a patient would be cured at one of these expensive hospitals that could not be cured at those built at the smaller cost named." Dr. Wilkins, in his capacity as Commissioner of the State of California, after examining all the leading insane hospitals in this country and Europe, speaks of our own Willard Asylum for Incurables, which was built at a cost of less than $1,000 per patient, as almost an ideal lunatic hospital; and, after describing its magnificent situation, picturesque surroundings, and excellent arrangements, observes that he "failed to discover even the shadow of a reason why a person, becoming insane in the neighborhood of this beautiful asylum, should be sent to Utica because he was considered curable."

Such being the case—and that such is the case there is no good reason to doubt—Dr. Wilbur's observation, that about ten millions of dollars have been worse than wasted in the construction of lunatic asylums during the last twelve years, is justified both by facts and considerations of economical importance, and by science as applied to the recovery of insane patients. The extravagant outlay for the accommodation of a comparatively small number, in a ward, robs a still larger number of benefits that might be derived from intelligent treatment in a well-ordered hospital; necessitates their retention in town and country poor-houses, and thus defeats the humane intention of the liberal State appropriations that have been everywhere made of late years for the comfort and recovery of this unfortunate class. Dr. Ranney, the Superintendent of an Iowa asylum, reports 865 patients in two hospitals in that State intended for only 550, and adds that from three to four hundred of the insane of the State were still uncared for. Now, Iowa has recently finished a new insane hospital for 300, at a cost of $600,000 ($2,000 per patient), but as the overcrowding of her two existing hospitals was 315, and as about 400 were in poor-houses, or badly supported by friends, fully 700 were on hand to be provided for. Another building to accommodate 500, and cost a million of dollars, is consequently in progress, and when this is completed, taking account of their inevitable increase in the meantime, the insane of the State will need another of the same capacity. Hence, as Dr. Ranney observes, this new outlay of a million will have the effect of similar heavy outlays elsewhere—to prevent adequate provision at a reasonable cost for the whole number of the indigent insane having claims upon the State. "It has long seemed to me," he adds, "very inconsistent to provide so expensively for one-half of the insane, and doom the other half, equally deserving, to poor-houses and such receptacles, or to severe struggles with want and privation in the hands of their friends." He concludes with this pertinent observation, which the American Association of Superintendents will find it to their advantage to consider carefully: "I have yet to see reason to believe that a hospital, costing $2,000 per head, will be more conducive to the recovery of patients from insanity than one costing $1,000, or even less." Dr. Andrew McFarland, another eminent Western alienist, describes a similar condition in Illinois, which, since 1851, has erected three State hospitals, at a cost of as many millions, and one very large county hospital, without apparently reducing the number of insane in the poor-houses of the State. "Is it a wonder," he asks, "that intelligent legislators want to know how long this is to continue, and inquire pretty minutely into the reasons for building so expensively?" Dr. Reynolds, of the Iowa State Asylum, at Independence, holds similar but more comprehensive language: "No State west of the Alleghanies has adequate hospital capacity for the insane; and until hospitals are built at a less cost per capita than $1,000, it is useless to talk of providing for all the insane of a community." In Pennsylvania, with her Danville asylum, accommodating 500 inmates at a cost of $1,000,000, "there are" (so says an eminent publicist) "now twice as many insane poor languishing in the dens and dungeons of the poor-houses and prisons as there were thirty years ago." In Philadelphia, for example, with her 1,200 pauper insane, accommodations exist for only 600, and a recent commission found 65 excited patients confined in a ward intended for only 19. A Connecticut commission finds 54 insane persons in the New Haven poor-house, some of them lying upon loose hay, clad in a few rags, covered with vermin, and in an indescribably filthy condition. The committee report that in their opinion the present lack of accommodation is due to the lavish expenditure of public money in providing for a part of the insane poor hitherto, and directly tax the superintendents of asylums with having promoted such extravagance. Mr. Sanborn, a Boston

publicist of note, reports that he found in a town poor-house in Essex County, within sight almost of the Danvers palace, Massachusetts, where $116,000 was expended for grading and roads, and $106,000 for drainage, water-supply, and sewerage, an insane woman, naked and helpless, in a wooden box filled with loose straw, and lacking all the comforts and decencies which our asylums are supposed to furnish. He adds that "hundreds of the insane poor of that State are now lying in town poor-houses and other unsuitable places, because officials insist upon spending millions upon a palace for a few patients, rather than build comfortable asylums for the many." An eminent Baltimore alienist finds that "there are now within the jails and poor-houses of Maryland over 500 insane and idiotic persons, for whom no proper provision exists, and who are utterly cast down and neglected, half-fed and ghastly in their squalor and filthiness." Dr. Conrad, of the Maryland Hospital for the Insane, whose pamphlet was quoted in our recent article on the Utica Asylum, traces the cause of this neglect of a large proportion of the pauper insane in the United States to the fact "that the present system of hospital management and support for this class of our pauper population is expensive beyond the ability of the several States to meet the demand." An illustration in point may be noticed in the significant memorandum that the water-supply for 500 patients at the Poughkeepsie asylum (Hudson River Hospital) has cost the State of New York $150,000, according to Dr. Wilbur, while the whole expenditure for the adjacent city of 20,000 inhabitants, including the large distributing service, was only $550,000. At Morristown, N. J., by the way, where $2,500,000 has been expended for the accommodation of 800 lunatics, the Building Commissioners pacified the Legislature by inviting the members to dinner on two occasions, at a cost to the State of $2,434.50, exclusive of railway fares.

Now, if the five millions in progress of expenditure for three new asylums in this State were really a resolution of the problem, How shall our indigent insane be provided for? criticism would seem ungracious, since the edifices are all of them nearly or fully completed. But such is not the case. From the latest accessible statistics, on the other hand, it appears that of the nearly 8,000 insane here at the end of last year, 482 were in private asylums, supported by friends; 844 in expensive State hospitals, at a weekly cost of nearly $7.00 per week, two-thirds of them supported at public expense; 1,170 taken from county poor-houses, in the asylum for incurables, at a per capita weekly expense of $3.00; 2,840 in asylums provided by the cities of New York and Brooklyn, at $1.80 per week; 1,761 in county poor-houses and other incommodious receptacles, at probably $1.50 a week. As the city asylums of New York and Brooklyn are overcrowded to the extent of nearly or quite 1,000, the three new institutions with a capacity of 14,000, are inadequate to empty the two city asylums of their excess, and the county poor-houses of their ill-provided inmates, and when every ward of the new buildings is full, there will still remain about 1,500 of our indigent insane, for whom five millions more must be expended. Very evidently, therefore, our experts must look to some less expensive system of provision, or submit to be discredited before the public, and to accept the imputation of incompetent and reckless expenditure of the public money.

The outline of the facts that it has been our purpose to present on this occasion will, it is to be hoped, be taken as a kindly intimation on our part that such extravagance of expenditure tends to discredit the judgment and probity of the medical profession, and to justify the bitter secular criticism that must inevitably follow its general exposure. At another time occasion will be taken to discuss the probable effect of State Boards of Lunacy, such as are proposed by Dr. Wilbur. At present it is our preference to leave the issue in the hands of the eminent gentlemen who have raised it, trusting that this fair exhibit of the failure of their system will lead to such modifications as to transform an evident blunder into a source of benefit to the State and to the unfortunate class whose welfare it concerns.

CONTAMINATED WELL-WATER AND TYPHOID FEVER.

One of the encouraging features of secular journalism of late is the great interest taken in sanitary progress and in the causation of zymotic diseases; an interest which is comparatively recent here, but to which the great sanitary reforms of Great Britain have been indebted for the popular attention they have attracted. An instance in point occurs in the recent quotation by the *Times* of this city from the St. Albans *Messenger*, Vermont, of February 12, of the details of a number of cases of typhoid fever in an obscure Vermont village, traceable to contaminated well-water. The village, like most such, has its main street, its little hotel, and the usual inequalities of surface incident to an undulating landscape, the land descending to the east and the north. Two years ago a gutter was sunk on the lower side of the street, running between the roadway and a well, so near that the walls of the latter were laid bare by the excavation. This gutter receives the drainage from several houses on the upper side of the street, none of them having water-closets, however, and only two or three drains that penetrate as far as the sewer. During the thaw which occurred in the latter part of January, the water in this well became turbid, but cleared again in a day or two, and was apparently potable. Shortly afterwards the fever commenced its ravages, almost simultaneously, in all the fifteen families drawing their water-supply from that source. Up to the date

of February 12, the whole number of cases in these fifteen families had been twenty-eight, without the slightest vestige of the disease appearing elsewhere in the neighborhood. The disease was first reported as gastro-enteritis by Drs. O. F. Fassett and J. H. Hamilton, the medical attendants; but subsequent investigation described as a severe form of enteric fever, due solely, in the opinion of the two physicians, to the contamination of the well-water.

Of course, to physicians acquainted with the exact researches which have been carried out by Dr. Letheby and others, in England; by Pettenkofer and the State Board of Health, Mass., in this country, to ascertain the relation of contaminated well-water to enteric fever, there is nothing novel or even exceptional in the facts just recited. It has long since become a settled suspicion—a proximate certainty, indeed—that the typhoid fever prevalent in the towns, villages, and farm-houses of New England, is, in the majority of instances, the direct result of drinking contaminated water. In many cases the well is beneath the house, adjacent to the cellar, which usually contains more or less decaying vegetable matter; in many, it is within a few feet of the barn; in some, indeed, in the barn-yard itself; and in many more the sink-drain discharges within a few feet of it, and pools of stagnant house-waste are permitted to percolate into the surrounding soil. The researches of the State Board of Health, Mass., carefully prosecuted in 1872, with the assistance of local medical assistance, developed the astounding probability that more than half the wells in New England are so situated as to be subject to sewage contamination; and the subject is one that should be thoroughly discussed by the secular press before popular attention can be sufficiently directed to it. Our enterprising daily contemporary, for example, might have added vastly to the value of its item, by pointing out the fact that the case just narrated is typical of thousands that escape attention and exposure, simply because the medical attendant is careless and inefficient, or possibly because he has not kept himself *au courant* with the important series of researches that has distinguished the last ten years of sanitary science.

MEDICAL AND SURGICAL HISTORY OF THE WAR.—Dr. Irving C. Rosse, of Washington, D. C., one of the collaborators of the Medical and Surgical History of the War of the Rebellion, is probably better informed on medical bibliography than any other man in the United States. After several years of tedious labor, he has lately completed an index of the subjects of the Surgeon-General's library, which extends over a range of seventy thousand volumes and pamphlets. This index, a fasciculus of which appeared at the Centennial, will not only be the best of its kind when printed, but will prove an invaluable reference to physicians and others who may wish the fullest information regarding the literature of any subject in medicine.

Reports of Societies.

NEW YORK MEDICAL JOURNAL ASSOCIATION.

Stated Meeting, February 1, 1878.

DR. ROBERT F. WEIR, PRESIDENT, IN THE CHAIR.

EXCISION OF THE HIP-JOINT.

DR. C. FAYETTE TAYLOR read a paper upon the above subject, and stated that he had not seen the advantages to be gained by the operative procedure. He was ready to perform the operation as soon as he became convinced that it was the proper thing to do, but his hesitation in resorting to excision was based upon the fact that he had seen cases far advanced in the disease recover, under conservative treatment, with useful limbs, but with more or less deformity, and others progress to complete recovery. He did not contend that excision was a procedure never justifiable, but that performing the operation as frequently as it was done by some surgeons, was a procedure, the propriety of which was very questionable.

It had been claimed by those who performed the operation with great frequency: 1, that excision cut short the disease and increased the chances of life; and 2, that the patient might, by the operation, hope for a better limb than if the case was left to nature. Both of those reasons were to be regarded as mere assumptions until the results obtained by operative procedure, and those obtained by conservative treatment, were compared with each other in similar cases. But that had not been shown, nor had an effort ever been made in that direction; and until such comparison was made, the statistics given were simply interesting and instructive, but not conclusive with reference to the real merits of the two methods of treatment.

From an analysis of Culbertson's statistics on 472 cases, and a comparison of the result obtained by conservative treatment with those obtained by operative procedure—and also from the results in cases which he had the opportunity to examine, Dr. Taylor reached the conclusion that he had either been permitted to see only unfavorable cases, or else the result obtained by the operation had been less favorable than when the limb had been left in nature's care. Of the 472 cases only 17 per cent. had been observed for more than one year after the operation; a period of time altogether too short to determine ultimate results.

The question was not, whether excision was ever justifiable, nor whether it was not sometimes followed by good results; that was admitted, but the question was, substantially, could excision be depended upon; could any determinate results be expected by its performance?

In answering the questions, the fact must be taken into consideration that the ultimate results of the operation were not well known; hence the opinion of very many prominent surgeons, that the operation at the present time was in a very unsettled condition.

It had been claimed that if the excision did not save life, that it saved the patient from a protracted period of suffering. Dr. Taylor cited cases, however, to show that excision could not be relied upon to cut short the disease. The first, was one presented to the New York Pathological Society by Dr. Erskine Mason, and published in the Society Reports in THE MEDICAL RECORD for December 15, 1877.

The second case was one in which the operation had been performed late in the disease, with unfavorable ultimate results. It might be objected to as an illustrative case, because of the late performance of the operation. The sinuses in this case closed at the end of two years; opened again six years later, and suppurated two years longer.

The third case, however, was one in which the operation was performed before suppuration was established. The incision after suppurating about two years, closed to break open again at the end of another year, and finally closed permanently at the end of four years after the operation. It was only at the end of twelve years, however, that the patient was able to walk. The question arose, how frequently did such cases occur? For it was believed that they were not isolated cases.

Reference was made to the fifty-eighth case in a late work upon Orthopædic Surgery, which was reported as sinuses closed, and that the patient was going about by the aid of a wheel-crutch. In January, 1878, Dr. Taylor had seen the same patient in Bellevue Hospital, where she was in a most deplorable condition, and exhibiting all the appearances of a patient suffering from prolonged joint-disease, and with the wound open.

Reference was also made to the case of Robert Anderson, reported in the same work, who was operated upon in 1862 by the removal of a V-shaped portion of the upper portion of the femur, for the purpose of making an artificial joint and overcoming the distortion due to anchylosis at the hip.

The case was reported as one of recovery, with the formation of an artificial joint at the place of section. A member of Mr. Anderson's family had informed Dr. Taylor that Mr. Anderson, at the present time, could neither sit nor ride, and that his condition in that respect had not been improved by the operation. For, one year after its performance, acute inflammation and suppuration supervened which terminated in union at the point of section.

Fourteen years after, however, the case was held up as one illustrating the triumph of a new principle in surgery, and one in which a real cure had been accomplished by its application. The report of the case was regarded as one having an important bearing upon the performance of excision at the hip-joint, inasmuch as it illustrated the liability of excised bone to take on inflammatory action subsequent to apparently complete reparation, and mention was made of it for the purpose of affording an opportunity for explanation.

Dr. Taylor stated that it was simply in the interests of science that he mentioned the case. In conclusion, he referred to an opinion given by Dr. Timothy Holmes in the *Medical Times and Gazette* for November 3, 1877—namely—that "excision does not afford better results than natural cure."

The paper being before the Association for discussion:

Dr. V. P. Gibney gave an analysis of 80 cases of hip-joint disease which had been under observation at the Hospital for the Ruptured and Crippled. These cases had been subjected to the internal treatment, counter-irritation, etc., measures adopted in the institution, but had not had any treatment by way of operation or mechanical appliances. In that sense, he spoke of them as nature's cures.

In these cases the term "cure" could be safely predicated.

Of the 80 cases cured, 28 were males and 52 females.

AGE OF PATIENTS WHEN A CURE WAS FULLY ESTABLISHED.

Cure was established in

1	before	5	years	of age.
2	"	6	"	"
10	"	7	"	"
13	"	8	"	"
20	"	9	"	"
29	"	10	"	"
47	"	12	"	"
71	"	15	"	"

In 3 cases the patients were 16 years; in 2 cases, 17 years; in 3 cases, 18 years; and in 7 cases, 19 years of age, before cure was established.

DURATION OF THE DISEASE.

In 33 cases the disease ran its course in 3 years.
In 28 cases, the duration varied from 3 to 6 years.
In 16 cases, it varied between 6 and 10 years.
In 1 case, it ran its course in 15 years.

GENERAL CONDITION OF THE PATIENTS DURING THE COURSE OF THE DISEASE.

Two terms were used: "good" and "fair."

By the term fair was meant that there was a slight degree of anæmia present, but not sufficient to militate against recovery.

Of the 80 patients, 69 were in good condition, and 11 in fair condition.

KIND OF RECOVERY WITH SPECIAL REFERENCE TO LOCOMOTION.

In this connection three terms were employed: "well," "fair," and "badly." By the term "well" was meant that the patient could walk and run without discomfort, although there might be a marked limp. Of this class there were 61.

By the term "fair," was meant that the patient could walk short distances without any assistance; but that in walking long distances, the aid of a stick, and sometimes a crutch, was required. Of this class there were 12.

By the term "badly," was meant that the patients were unable to walk well without the aid of a high shoe, a crutch, etc. Of this class there were 7.

DEGREE OF DEFORMITY.

In 2 cases anchylosis took place, with the limb at an angle of 90° with the body. In 3 cases recovery took place with the limb flexed at an angle of 110°; in 3, at an angle of 120°; in 19, at an angle of 135°, which militated but little against good locomotion; in 19, at an angle of 145°; in 18, at an angle of 150°; in 11 cases, at an angle between 160° and 170°; and in 4 cases no estimate was made.

AMOUNT OF SHORTENING.

In 1 case there was no shortening. When it first came under observation, it was a typical case of acute synovitis of the hip-joint.

In	2	cases	there	was	¼	inch shortening.
"	24	"	"	"	1	" "
"	17	"	"	"	1¼	inches shortening.
"	19	"	"	"	2	" "
"	7	"	"	"	2¼	" "
"	7	"	"	"	3	" "
"	2	"	"	"	4	" "

Five of the 7 with 3 inches shortening, and the 2 with 4 inches shortening, were never under treatment at the hospital, but applied for high shoes, and the observations were made.

OCCURRENCE OF ABSCESS.

In 48 cases abscesses had existed.

In 31 cases there was no abscess during the entire course of the disease.

RATIO OF MORTALITY.

The ratio of mortality in 288 cases of hip-joint disease was 4¼ per cent. from exhaustion; 4¼ per cent. from amyloid degeneration; 1¾ per cent. from tubercular meningitis; and 1¾ per cent. from other diseases. See Strumous Element in the Etiology of Joint-Diseases, *New York Medical Journal*, July and August, 1877, Table XI.

RECOVERY WITH MOTION AT THE JOINTS.

Out of the 80 cases, there was unmistakable motion over an arc, varying from 15° to 90°, in 12 cases.

Dr. Lewis A. Sayre remarked that he had never taught that exsection cut the disease short, as might be inferred from what had been said, but he held that the hip-joint disease should be treated as conservatively as possible. If, however, there was progressive caries, notwithstanding such conservative treatment, he held that the surgeon should resort to operative procedure. For, if dead bone was present, it must be removed before the disease could be arrested. If the disease could be arrested in the inflammatory stage by appropriate treatment—that is, before the bone became necrotic—it was the duty of the surgeon to resort to every known means to accomplish that purpose. Dr. Sayre contended that, in a majority of cases, by appropriate treatment and the use of proper mechanical appliances, the progress of the disease could be arrested, and recovery with perfect motion obtained; thereby giving much better results than had been obtained in the cases reported by Dr. Gibney, in the majority of which there was loss of motion and the existence of more or less deformity. He thought Dr. Taylor would coincide with him in that opinion. With regard to exsection, it was not to be performed, except as a *dernier ressort*. It was not to be used as a means to cut the disease short, but was a justifiable method to be employed for arresting the progress of the disease when dead bone was present. So long as dead bone was present, it was a foreign body, was a source of constant irritation, and the case could not be cured while it remained. Unless, therefore, the disintegration and exfoliation of the bone was rapid, and it could readily pass out through free sinuses, it was the duty of the surgeon to cut down and remove it, the same as he would remove dead bone from any other part of the body. If, by making a free incision through the soft parts, perhaps enlarging the opening in the involucrum, the dead bone could be readily removed or rapidly discharged, very well; it might be that, by such procedure, an exsection could be obviated. But when there was imprisoned dead bone, which was a source of irritation, kept up the inflammation, and made the disease *progressive*, it had seemed to him justifiable to make an exsection, and thus in a few minutes rid the patient of a piece of dead bone which, if left to nature, could at best be removed only after the lapse of a long period of time. In a majority of such cases, the operative procedure gave the patient a fair chance for a rapid recovery.

ULTIMATE RESULTS.

With reference to the condition of the cases years after the operation, he could only say that sufficient time had not yet elapsed to enable any one to arrive at definite conclusions. The best that he was able to do at present was to give the condition of the patient at the time a report was made. There were several cases in which sufficient time had passed without recurrence of the disease to enable him to say with great confidence that the recovery was complete. The first patient upon whom he operated had now survived the operation over twenty years; was married, and no one would suspect from her walk that she had been the victim of hip-joint disease. It was believed that her case might be reported as one in which complete cure had been effected. There were several other cases in which the cure had been equally satisfactory. It was to be remembered that the patients upon whom he had operated had nearly all been *in extremis*; that the operation had been consented to, simply because there seemed to be no other channel through which benefit for the patient could be obtained.

Dr. Sayre then related the history of several cases, and also exhibited a patient formerly under treatment at the Hospital for Ruptured and Crippled, in which there was enlargement of the liver, waxy casts in the urine, and a whole retinue of equally unfavorable symptoms, but in which recovery took place to such an extent as to permit the patient to walk about with comfort and with motion in the joint. In some of the cases the sinuses and the wound made by the operation had entirely closed. Such cases, it was believed, proved the justifiableness of the operation, for all the patients would have soon died had it not been performed.

A specimen was exhibited in which could be seen a piece of dead bone imprisoned by a new growth of bony material, thus rendering it impossible for the old bone to escape. Had it been permitted to remain, the disease would have been prolonged for years; but by its removal the patient had been restored to health; apparently at least, as no one could yet tell what might be the result of the case in years to come.

Reference was made to several cases in which like results had been secured.

With reference to the case in Bellevue Hospital to which Dr. Taylor had alluded, Dr. Sayre remarked that he performed the operation of exsection upon the child, and when the case was reported in his book, she was able to be up and to walk by the assistance of a wheel crutch. About that time his services at the hospital ceased, and he saw nothing more of the case until he was reappointed visiting surgeon, two years after, when he found the child still in the wards, and in a bad condition. Her present condition was about the same as one year ago, and how long she might live it was difficult to say.

With reference to the case of Robert Anderson, to which Dr. Taylor had alluded, it was not a case of exsection of the hip-joint at all, but a section through healthy bone; a much more dangerous and serious operation. Exsection of the hip-joint was really a simple operation; but an operation performed for the relief of distortion of a limb dependent upon anchylosis of the hip-joint was an entirely different thing. The statement made in the published report was exact with reference to Anderson's condition when last heard from, which was in 1869 by letter requesting the doctor to forward to him a hand velocipede. [The original letter was read.] At that date he stated in his letter that his "health was good."

Dr. Sayre asked Dr. Gibney how many of the 4¼ per cent. of fatal cases he had reported would have been saved had exsection been performed? Almost every case he had operated upon had been given up to die, yet, of eight cases which had been discharged

from the Hospital for Ruptured and Crippled, as incurable, seven had made good recovery.

Dr. Gibney thought it was impossible to answer the question correctly.

Dr. Weir asked for statistics relating to three questions: 1. What was the ratio of mortality in cases not treated, and in which there were numerous sinuses, suppuration, etc.? 2. What was the ratio of mortality in cases treated by means of mechanical appliances, etc., without the operation? And 3. What was the ratio of mortality after exsection?

Dr. L. M. Yale gave a partial answer to the questions of the President. Statistics on the points asked for were exceedingly slender. In addition to those just given by Dr. Gibney, were those of Billroth, gathered from the Zurich clinic, and those of Hueter, from the Greifswald clinic. Billroth, who followed the history of his cases after they left his immediate observation, gave 20 deaths in 64 cases, or 31¼ per cent. mortality. Hueter, not following up the cases, 23 deaths to 86 cases, or 26⅞ per cent. Together, 43 deaths in 150 cases, or 28⅔ per cent. That might seem an excessive mortality, but if it was remembered that deaths from phthisis, exhaustion, miliary tuberculosis, meningitis, etc., occurring while the hip disease was in existence, were generally all included; and if farther it was borne in mind that our impressions of mortality were likely to be formed from cases brought early under the best surgical care, and treated with the best modern appliances, while probably the cases coming under such treatment early, even in New York, were a minority, Dr. Yale was inclined to think that the statistics quoted were not so far astray.

Another point, regarding which statistics seemed to be altogether lacking, was the relative number of cases of hip disease that passed to suppuration at all. It had been estimated that as many as 50 per cent. suppurated. Now since, with the exception of occasional tubercular disease, the deaths from hip disease occurred in the suppurative stage, the fatality per centum of that stage would be relatively higher; that is to say, about 57 per cent. of suppurating cases ultimately died unhealed. How far this was an accurate estimate, Dr. Yale could not say, but it was based upon the only available material, and it would be interesting perhaps to see how the results thus obtained compared with those obtained by excision. He had assisted at the operation about forty times, and many of the cases had remained under his care for a considerable time. In addition, he had seen a number of cases at a later period in their history. Of all these cases he knew personally of their ultimate or present condition in but twelve, in addition to the case just shown by Dr. Sayre. Many more were doing well when he last had seen them, but had not then reached a definite result. He therefore spoke only of such as he had seen and knew of with certainty. Of the thirteen cases six were dead, three having died within three months, three between one year and two and a half years after the operation. Six were cured, and by cured was meant that there was no discharge, and that all sinuses were definitely healed. They were all cures with free motion, all quite as free as the case present, and in several the motions were quite of the normal degree. Of the six cured, five were Dr. Sayre's cases, and the sixth was operated upon by Dr. A. W. Stein. This last case had absolutely a complete motion of the hip-joint as upon the sound side, the examination having been made upon a table, to avoid mistake, and verified by Dr. Gibney. There was in this case 2⅜ in. shortening, one inch of which only was in the femur, the remainder in the leg. The thirteenth case had just been heard from by letter, and reported a very slight motion, and a sinus still open near the anterior superior spinous process of the ilium; but his general condition was much better than before the operation, 2¼ years ago. These few cases give: cured, 46 per cent.; deaths, 46 per cent.; doubtful, 8 per cent. Counting the doubtful case as death, gave 54 per cent. death, or rather less than the estimate of death among all suppurating cases. These cases, it should be borne in mind, were of the worst character, many of them having resisted treatment by mechanical means in the best hands for a long time.

In his experience, then, mortality was not increased by the operation. He had never seen a recovery with a useless limb. His belief was that cases, if cured, were cured more speedily, and in much better condition than if left alone; and if not cured, could scarcely be said to be in worse condition. Until he saw reason to change his belief, he should feel it his duty to advocate the operation on the same surgical grounds, and under the same restrictions as he would a like operation elsewhere, knowing no reason why the hip-joint should in any sense be made an exception to general surgical rules. Farther, in certain very bad cases, where the suffering and the constitutional disturbance were very great, he would feel bound to propose the operation, even with the certainty of its failure, on the ground that it would, by diminishing these symptoms, render life more tolerable, and probably prolong it.

Dr. Sayre thought that Dr. Yale should have embraced the results in the total 40 cases, in order to make his statistics of any value; for, as the question remained, the result in 28 cases was not mentioned. One of the twenty-eight cases not referred to, had first been exhibited, and showed a good result for the operation.

Dr. C. T. Poore remarked, that a table of ultimate results, both after excision of the hip-joint and after mechanical treatment in any great number of cases, sufficient for scientific statistical purposes, did not exist. etween those who were strong advocates of mechanical treatment carried to its utmost limit, and those who advocated exsection in a certain class of cases, or when the disease has reached a certain stage, there seemed to be an almost irreconcilable difference of opinion—and until we had reliable statistics from both sides we must remain in doubt.

There were some cases of hip disease that recovered without any treatment; others recovered after rest or mechanical support; others recovered only after excision; while some progressed from bad to worse, no matter what plan of treatment was adopted.

The usual mode of reporting cases, both of excision and after mechanical treatment, made them of no value. He would throw out all cases of reported cure, unless the condition of the limb was explicitly stated; if an exsection had been performed, the statement of a physician should be included as to the amount of shortening, and whether there existed any sinus or not. The ability to walk without support should not be regarded as proof of a cure. For, he had seen patients go about without pain, and without any support, when the femur was extensively diseased, and who ultimately died from a continuance of suppuration.

During the past few years he had excised twelve hip-joints. Two of these were thrown out; one done this week, the other still under treatment, although he thought that a good result would be obtained. Of the ten cases, five died: two from amyloid degeneration of the liver, etc.; one from meningitis; one from phthisis, and it was supposed that one died from heart-clot.

The death from meningitis, and that from phthisis, Dr. Poore thought should not be reckoned as deaths from hip disease.

Of the five remaining, one was *cured*.

In one case, at the time of the operation, there was albumen in the urine, no casts could be found, and there was enlargement of the liver. The femur was extensively diseased, and was divided about 1½ inches below the trochanter minor. The patient had been examined very recently, and his general health was good. All sinuses were closed, except one, through which exposed bone could be detected on the ilium. He could flex, rotate, and extend the thigh on the pelvis with considerable freedom, but he was unable to raise his foot from the bed; he could bear his whole weight on the limb, which was 3¼ inches shortened. He had no albumen in his urine after the operation, and when the examination was made only very slight enlargement of the liver could be detected. That was not a very flattering record, but it was to be added that all his cases give a bad family history. Four of the cases had developed extensive abscesses before coming under operation, and four after. In six cases the shaft was diseased below the point of section, and in some a lower division of the bone failed to find healthy tissue. In four cases the bone was healthy below the point of section.

It seemed to Dr. Poore that a hereditary diathesis had much to do with the result, if not the cause of joint-disease. The fact that exsection in some, if not most of his cases, has not given good results, was not an argument against the operation, as the cases did not come under his care until all chance for cure by mechanical means had long since passed. When should mechanical treatment give place to operative procedure? was a question that each surgeon had to decide for himself. Dr. Poore thought that it was not the duration of the disease, but the pathological changes in the joint, that should form the basis of our decision. Dead or carious bone in a joint should be treated in the same way as diseased bone elsewhere. If, after careful examination under ether, he was satisfied that the joint was disorganized, that the cartilage had been destroyed, he thought that the question of excision should be seriously considered; and if the patient belonged to a family whose history was bad, he should consider it an additional argument in favor of that operation. He had never excised a joint when, in his own opinion, or in the opinion of those gentlemen present, a cure by rest and mechanical treatment was probable. There was nothing peculiar in hip-joint disease; the same general rules of surgery applied to that joint as to any other—and, perhaps, with more force, when we considered the structure of the joint. Dr. Poore very much regretted that those gentlemen who were so ardent advocates of mechanical treatment, and who held views different from some others, had not given statistics of hip disease treated in the third stage, and the results in a way that would be of some scientific value; for, until they did, all discussion on the subject was useless.

That disease might again be lighted up in the end of the femur, or in the acetabulum after a successful excision, was not improbable. He had, however, never seen or heard authentically of such a case, and doubted very much whether a return of disease after excision was as common as after spontaneous cure, or one after mechanical treatment. He was as strong an advocate of the mechanical treatment of joint-disease as any one, but he did not believe in holding out hopes of cure in cases where the joint was disorganized, and when abscess had been formed with burrowing of pus under the muscles. Dr. Poore believed that more lives would be saved with a useful limb by not trusting too long to mechanical treatment. There was almost no dangers from the operation itself, and the relief to the patient had in all his cases been very marked.

Dr. Weir remarked, that while in the service at St. Luke's Hospital, the operation of exsection of the hip-joint was forbidden in that institution. Consequently, in many cases he had made an incision as if for exsection, removed the dead bone as far as possible, perhaps made an opening through the involucrum for that purpose, and those cases did very well. The discharge diminished, and the general condition of the patient was improved. In proper cases he favored complete exsection.

Dr. Sayre remarked, that such operative procedure was what he had called partial exsection, and in certain cases was an operation that might with perfect propriety be first resorted to. If, subsequent to such an operation, the caries was progressive, exsection should be resorted to, and it was then not only a justifiable operation, but it was the duty of the surgeon to perform it. The partial operation he had performed many times, and in some cases with very satisfactory results.

The Association then adjourned.

NEW YORK THERAPEUTICAL SOCIETY.

Stated Meeting, February 8, 1878.

Dr. James R. Leaming, President, in the Chair.

REPORT OF COMMITTEE ON NEUROTICS.

I.—*Results of the Use of Chloride of Potassium in Epilepsy.*

II.—*Preliminary Report on the Use of a Mixture of Bromides and Chloral in Epilepsy.*

Dr. E. C. Seguin, Chairman of the Committee, made the report, of which the following is a brief summary. The experiments in the first instance were made by noting the number of epileptic attacks occurring in a certain number of patients during a certain period of time.

First.—Noting the number of attacks which occurred in a certain number of patients while receiving a placeboic treatment, during a certain period of time, and also the number of attacks occurring in the same patients while under the bromine treatment for a corresponding length of time.

Second.—Noting the number of attacks occurring while under the chloride of potassium treatment, and comparing it with the number of attacks occurring in the same patients during treatment by bromides for a corresponding length of time.

The following were among the conclusions reached:

I.—That bromide of potassium had a positive restraining influence over epilepsy, both in reducing the number and the severity of the epileptic attacks.

II.—That chloride of potassium was almost inert as an agent in the treatment of epilepsy.

It was inferred that the potassium could not be the efficient element in controlling the epileptic attacks, because the chloride of potassium contained more potassium than did the bromide of potassium.

PRELIMINARY REPORT ON THE COMBINED USE OF BROMIDES AND CHLORAL IN EPILEPSY.

The formula employed by Dr. Seguin and two of his clinical assistants was as follows:

℞.

Potas. bromid	ʒi.
Chloral hydrate	ʒss.
Aquæ	ʒvii.

M.

Of that mixture from four to six teaspoonfuls were administered daily.

The observations were made by Dr. A. McLane Hamilton, of New York; Dr. J. C. Shaw, of Brooklyn; Dr. E. C. Seguin and two of his clinical assistants, Drs. T. A. McBride and N. B. Emerson. The combination of chloral with bromide of potassium had been used in twenty-eight cases, and it was shown that the epileptic attacks were warded off by the new solution quite as well as by the bromides alone (bromide of ammonium in the same quantity being used instead of the chloral hydrate). The reflex irritability of the throat was reduced equally as well as by the use of the bromides alone.

In all the cases there was a remarkable immunity from the bad effects of the bromides, especially in the psychic sphere, and little or no acne had been produced. In no case was more than forty-five grains of each drug given daily, and really no bad results had been realized under the new treatment.

It had been hoped that the admixture of the chloral with the bromide would diminish the evil results produced by the bromide, such as general depression of the system, irritation of the skin, etc., and those advantages had been partially, if not fully, realized. The good results obtained had encouraged the committee to make more extensive trial of the new mixture.

Dr. W. H. Thomson thought it quite probable that the apparent good effect obtained by the use of chloral as indicated would prove but temporary.

He always used phosphorus and cod-liver oil with the bromides in the treatment of epilepsy; relying upon the phosphorus to prevent the bromic acne.

Dr. E. R. Squibb remarked that he had not yet found any one who had seen an attack of *grand mal* occur when the patient, at the time of its occurrence, was suffering from bromism. The history of four cases of epilepsy was referred to, which had been treated by the use of bromide of potassium alone. The manner of administration had been to give the drug in gradually increasing doses until the attacks were arrested. Little or nothing had been seen of the bad effects produced by the bromides. Intermissions in the use of the bromide had been given the patient, varying in length from two to ten days, and to these a good deal of the absence of the bad effects of the remedy was attributed.

Dr. F. A. Castle remarked that he had employed chloral and bromide of potassium in combination in the treatment of other conditions than the epileptic, and had found that a less quantity was required than would have been necessary had either drug been used alone.

Dr. E. C. Seguin remarked that his experience was against the omission of the bromide for even a single dose in the treatment of epilepsy.

Dr. Thomson endorsed Dr. Seguin's experience in that particular. He also referred to impressions on the surface nerves as a means for diminishing the quantity of bromide required to control the epileptic attacks. It was his habit, therefore, to produce surface irritation on epileptic patients by the use of a drachm of red pepper to a pint or quart of water, and applying it with a sponge.

Dr. H. T. Hanks remarked that although the effect of the chloral combined with the bromides in the treatment of epilepsy might be merely palliative, yet in that way it assisted nature in affecting a cure of the disease, or gave other remedies an opportunity to operate.

Dr. Squibb referred to the use of nitrite of amyl for the same purpose. It was a remedy which produced effects much more evanescent than those produced by chloral, yet it had been successfully used for preventing the occurrence of epileptic attacks. Although not directly curative, it had proved in many cases a valuable adjuvant in the treatment of the disease, because it obviated the retarding influence produced by a convulsion.

Dr. H. G. Piffard exhibited a proposed

NEW DOVER'S POWDER,

made by substituting sugar of milk for sulphate of potash in the old formula. He also exhibited *pilocarpin*, put up in a convenient form for preservation by triturating the alkaloid with one hundred parts of sugar of milk.

A specimen of Calcutta flaxseed was also exhibited, which had been suggested as a substitute for cod-liver oil.

Dr. E. C. Seguin objected to the use of the term "trituration," because of its immediate association with a fraudulent school in medicine.

After a brief discussion upon this point, the Society adjourned.

Correspondence.

LIBERALISM IN HOMŒOPATHY.

To the Editor of The Medical Record.

Sir:—As the one who offered the first resolution, a modified form of which has recently been adopted by the Homœopathic Societies of the County and State of New York, I beg to say a few words suggested by your editorial in The Medical Record of Feb. 16th.

The resolution does not indicate, and was not intended to imply, that those sustaining it had changed either belief or practice; it was not offered, hat in hand, to any school or faction; its sole purpose was to correct an error which, to a greater or less extent, prevailed both within and outside the profession—that is, the erroneous impression that we practically excluded everything in medicine outside the segment of homœopathy.

This supposition is entirely at variance with fact; indeed, we claim to be the medical practitioners in the broadest acceptation of the term, inasmuch as we have never declined to avail ourselves of any source of knowledge or practical experience—homœopathy included.

There are those, opposed to our resolution, and who do believe in and who endeavor to practise exclusive homœopathy, but they are exceedingly few in number.

By homœopathy is meant a principle upon which remedies are selected. The question of the amount of the remedy used is a matter of personal experience, and the mode of its preparation purely a question of pharmacy; it has necessarily no more connection with homœopathy than has the silver bill.

The intent of the resolution was to formulate our platform, and to say that it should be vast enough to include for examination every pertinent fact and theory in the universe; that every member of our body should possess absolute freedom to believe or disbelieve, according to his sincere convictions, and that he should be master of his own professional administration: that he shall not be bound to one moment's perpetuity of belief, changing with each hour, if he so wills, in compliance with new facts and the progressive evolution of science.

E. P. FOWLER, M.D.

38 W. 40TH STREET.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from February 17 to February 23, 1878.

WATERS, W. E., Captain and Assistant Surgeon. In addition to his present duties, to examine recruits and attend the artillery command in camp near this city (San Antonio). S. O. 33, Dept. of Texas, February 12, 1878.

WINNE, C. K., First Lieutenant and Asst. Surgeon. Granted leave of absence for one month on surgeon's certificate of disability, with permission to leave the Department and apply for one month's extension. S. O. 14, Dept. of the Platte, February 13, 1878.

TURRILL, H. S., First Lieutenant and Asst. Surgeon. To accompany recruits from San Antonio to Fort Clark, Tex., and on arrival report to the Post Commander for duty. S. O. 31, Dept. of Texas, February 9, 1878.

BARNETT, R., First Lieutenant and Asst. Surgeon. Relieved from temporary duty at Little Rock Barracks, Arkansas, to proceed to Lake Charles, Calcasieu Parish, La., and resume his duties as Post Surgeon. S. O. 22, Dept. of the Gulf, February 12, 1878.

THE NORTH CAROLINA MEDICAL JOURNAL.—This journal is a revival of the *Medical Journal* of North Carolina, which ceased in 1862. In certain respects it is an old friend in a new dress, and is welcomed accordingly. It contains original articles, selected papers, correspondence, editorial articles, reviews, and news; is published at Wilmington, Ohio, and is under the editorial charge of Dr. M. J. De Rosset (formerly of Baltimore, and now of this city) and Dr. Thomas F. Wood, of Wilmington, N. C. This number is well presented, and if it is a specimen of what is to follow, we have no doubt that the journal will be well received by the medical profession of the State.

ALUMNI DINNER OF MEDICAL DEPARTMENT OF UNIVERSITY OF NEW YORK.—The seventh annual dinner of the Alumni Association of the Medical Department of the University of the City of New York took place on the evening of February 22d, at Delmonico's. The annual business meeting preceded the banquet, and resulted in the choice of the following ticket of officers for 1878:

President, James H. Anderson; Vice-Presidents, William A. Hammond, John R. Dickson, Josiah Gautier, S. Fleet Speir, J. J. Peterson, Thomas S. Bahan; Secretary, for three years, Frederick R. S. Drake; Treasurer, C. Dixon Varley; Executive Committee, D. B. St. John Roosa, Stephen J. Clark, F. Le Roy Satterlee, A. E. MacDonald, Edward L. Pardee, Andrew Otterson, R. A. Witthaus, W. C. Lutkins, L. Goldschmiedt, Newton M. Shaffer, M. J. Moses, J. H. Hobart Burge.

Dr. James H. Anderson, the President of the Association, presided, and had on either side of him Mayor Ely, Chancellor Crosby, Rev. Dr. John Hall, Rev. Stephen H. Tyng, Jr., Mr. John Taylor Johnson, Mr. Joseph H. Choate, Mr. Chauncey M. Depew, Commissioner of Charities Townsend Cox, and ex-Commissioner Isaac H. Bailey. Dr. Anderson announced the toasts, and called upon Mayor Ely to speak for the City of New York. His Honor made some remarks, and was followed by Chancellor Crosby. The toast to the Council of the University was responded to by Prof. D. B. St. John Roosa, M.D., who urged that the University should receive aid so as to become a real university, in which all branches of knowledge should be taught. He denounced the manner in which it is neglected, and urged that New York and New Yorkers should not assist in building up a university in Massachusetts, when one ought to exist in this city, where there is good foundation for it. In conclusion, Prof. Roosa declared that the policy of founding small detached colleges for the purpose of teaching special branches was wrong, and claimed that such institutions should be embraced in the University of the City of New York.

Rev. Stephen H. Tyng, Jr., made a long and very earnest address, claiming that the medical and clerical professions were kindred, had been conjoined in the earliest age, and should always assist one another. He insisted that the clergyman, by calming the mind of a patient, helped the doctor to make a cure, and admitting that physicians often become the custodians of secrets such as would be kept from the preacher, he urged that they should never forget that theirs are sacred obligations. The Bar was responded to by Hon. Joseph H. Choate, in his usual graceful and witty style, which kept his hearers in continual good-humor. He declared that lawyers were kindred to doctors and clergymen, and that their relations should never be inharmonious; but complained that while upon a man's death the clergyman claimed his soul, the doctor his body, and the lawyer his estate, the last named got less than the others. They were continually profiting by the man in his life, but the lawyer had but one chance at him, and that only after his death.

Dr. W. H. Draper and Dr. James R. Wood being unable to be present and respond to the toast of "our sister colleges," sent letters of regret. Isaac H. Bailey responded to the toast of "Our Public Charities," Dr. George K. Smith, of Brooklyn, and Prof. A. E. Macdonald, N. Y., to the "Alumni," and Hon. Chauncey M. Depew to "the press."

About two hundred guests were present, and as usual the affair was a brilliantly successful one. The

speeches were excellent and to the point, and were listened to with the greatest attention.

The following burlesque on the toasts was circulated during the evening, and created much amusement. As will be seen, the quotations are made from some of the well-known certificates of certain mineral waters:—

The City of New York, "Well suited for cases of acute disease." *The University*, "Not only a luxury but a necessity." *The Council*, "Very mild in its action." *Sister Colleges*, "Most agreeable, alone or mixed." *Public Charities*, "Prompt and efficient." *Our Alumni Association*, "Impregnated with its own gas." *The Pulpit*, "I always recommend it—to my patients." *The Bar*, "I often have recourse to it." *The Press*, "Specially adapted for daily use."

THE LATE DR. E. R. PEASLEE.—At a stated meeting of the New York Academy of Medicine, held February 7, 1878, a committee consisting of Drs. Fordyce Barker, James L. Banks, and Austin Flint, Sr., presented, and the Academy unanimously adopted, the following resolutions to the memory of Dr. E. R. Peaslee:

Resolved, That by the death of our late Fellow and ex-President, the Academy of Medicine has lost one of its most distinguished and useful members, who was ever zealous for its interest, usefulness, and reputation; who by his great success as a teacher of various departments in several Medical Colleges, has done much for the education of a large class of medical practitioners in all parts of the country, now working in the interests of humanity; who, by his important papers, either read before the Academy, or published in different medical journals, and by his learned and able works, has added much to the science of medicine and greatly improved its practice in many important departments, and has left an imperishable name, greatly to the honor and reputation of this Academy and of the profession of this city and of this country; and who, by his personal character, won our warm esteem and high respect.

Resolved, That these resolutions be entered in the minutes of the Academy, and be sent to the medical journals of this city for publication, and that an engrossed copy be sent to the bereaved family.

H. T. HANKS, *Recording Secretary*.

SUSPENSION IN SPINAL DISEASE.—Dr. Bernard Roth (*Lancet*, Feb. 2d) says that the "so-called newly introduced method of suspension by the 'gallows' has been largely employed for many years past in several orthopædic institutions on the Continent;" that he saw last spring nearly the identical kind of apparatus used by Dr. Klopsch, of Breslau. "Here a strong horizontal beam is supported at its middle on a vertical mast fixed in the ground, and from the two extremities of the former depends exactly the same kind of gallows as is attached to the apex of Dr. Sayre's tripod. The patient's head having been fixed in the way now so well known here, the cord is shortened till the toes can only just touch the ground; the patient is now told to walk round and round, the horizontal beam being made to turn on a pivot. There are usually two or three cross-beams, and I have seen as many as six patients, walking round simultaneously as best they could on tip-toes, while their spines were being extended by the weight of their bodies. Complete suspension in the air is also employed very often. Even the shoulder-loops are quite identical with those now said to have been invented by the American professor. I saw a similar apparatus and treatment at the orthopædic institution of Dr. Schildbach, at Leipsic. This gentleman is a *privat docent* of, and has an orthopædic outpatients' department (*Policlinic*) in connection with the University of Leipsic. It is a curious fact that in Germany the gallows is called Glisson's swing (*Glisson'sche Schwebe*), after Francis Glisson, an English physician, who wrote a book, 'de Rhachetide,' a second edition of which appeared here in London in 1660. He quotes at page 868 a description of the swing, with an illustration, and explains the principle on which it is used. I have no wish to depreciate the great debt of gratitude we owe to Dr. Sayre for his introduction of the plaster-of-paris bandage for spinal disease, especially malum Pottii; but I do not think it is quite fair that no acknowledgment has been made of the real inventor of the suspender, nor of the fact of its having been so long in common use in Germany."

DEATH FROM CHLOROFORM.—We have made inquiries as to the death from chloroform, reported last week to have occurred at the Devon and Exeter Hospital. From a communication kindly made to us by Dr. H. Gordon Cumming, House-Surgeon to the Hospital, we gather the following outline of the facts. The patient, a well-developed and healthy-looking lad, aged about eighteen, was about to undergo the ordinary operation for the removal of an elongated and indurated prepuce following soft sores. The administration proceeded satisfactorily for two or three minutes, and the boy was becoming anæsthetized. A severe spasmodic stage then supervened; a change being noticed in the patient's appearance, the chloroform was at once withheld. This change consisted in a sudden lividity of the countenance and sudden dilatation of the pupils. Every effort was at once directed to restoring the patient: cold water was dashed on the face and chest, air freely admitted into the room, and artificial respiration kept up for a long period. Only about one drachm of chloroform was found to have left the drop-bottle, and the portion sprinkled on the mask, just before its removal, still remained, so that the lad could not have been exposed to the vapor of one drachm. The heart had been previously examined, and nothing found to contra-indicate the anæsthetic. No *post-mortem* examination could be obtained, in spite of much persuasion with the friends. —*Brit. Med. Jour.*, Feb. 2.

TELEPHONIC AUSCULTATION.—A correspondent in the *Student's Journal* of Saturday has the following: "In my last letter I suggested that the telephone might be used for the purpose of diagnosing heart and lung diseases. I scarcely expected to be called upon just yet to announce that the idea has been carried out, but I observe that a correspondent of the *Medical Press and Circular* states that he has been able, with the telephone, to hear the sounds of the chest, distinctly, at a distance of thirty yards. The time may come when our fashionable physicians will have consulting-rooms in the large provincial towns, each having telephonic communication with his London consulting-room, where he will sit, examine, and prescribe for those patients who would find it inconvenient to come up to town to consult him. Of course, patients would have to attend at the provincial consulting-room at such times as he would appoint. Bristol patients could attend at 10 o'clock A.M., Birmingham at 10.30, Oxford at 11, and so on. There would probably be some difficulty about the fees; they could not be transmitted by telephone. But these could be paid to an agent or secretary."—*Dublin Press and Circular*.

NOW READY.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS

By SIDNEY RINGER, M.D.,

Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price, - - - - - $4.50

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"The author, as we have said, designed the book simply as an introduction to Therapeutics for the use of students and young practitioners. That to such it will be found most useful there is no doubt; but we are also sure that, from the mass of valuable, readable, and well-arranged information it contains, and the numberless minor practical hints scattered throughout its pages, the work will be almost equally useful to the busy practitioner; and that it will receive from the profession generally the warm welcome which it deserves."—*British Med. Journ.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on Therapeutics."—*St. Louis Med. and Surg. Journal.*

IMPORTANT TO PHYSICIANS.

Physicians practising in the Southern and Western States, are usually careful in designating (WARNER & Co.,) when writing prescriptions for Pills, as they have derived the most beneficial and uniform results from the use of these preparations. It would be well for physicians everywhere, to exercise this same caution when prescribing pills, of Quinia and Phosphorus, as well as other kinds.

Twenty years experience has demonstrated that the covering of pills with sugar, affords the acme of perfection, when the coating is properly applied, and for this reason, WARNER & Co's, are superior to all other sugar-coated pills in the market. They possess advantages in every respect, over those coated with gelatine. Sugar is more soluble than gelatine and when necessary, is applied to pills, so soft as not to retain their form uncoated.

They are beautiful in appearance, more acceptable to the patient, more readily swallowed than the oval or pointed shaped pills, with their sticky coating.

Doctors who had formed a prejudice which caused them to favor gelatine-coated pills, on account of their much vaunted merit for solubility, write us, that their delicate patients revolt at their ugly color and shape. Physicians throughout the country have it in their power to disprove their claim for greater solubility, as samples of gelatine-coated pills, in small paper boxes, have been extensively distributed within a comparatively recent date.

After being kept for a time, they become hard and brittle. The enclosed mass, as well as the gelatine coating, losing all its moisture. This proves that gelatine is not non-pervious, and is certainly not the proper material with which to protect medicinal substances, especially Phosphorus in pilular form.

The original manufacturer of gelatine-coated pills, conveys the information that two coats of shellac varnish were applied before the covering.

Prof. Remington, of the Philadelphia College of Pharmacy, demonstrated long ago, by practical experiments, that sugar-coated pills are more soluble than those gelatine-coated.

ALWAYS SPECIFY "K. & M." GRANULATED EFFERVESCENT SALTS.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen,—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KEEN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

K. & M.

Granulated Effervescent Preparations

Of Magnesium Citrate, Potassium Bicarb., Citrate, Benzoate, and Bromide; Lithium Benzoate and Carbonate; Cerium Nitrate and Oxalate; Bismuth Citrate (SOLUBLE), Pepsin, and Bismuth; Pepsin, Bismuth, and Iron, etc., etc., etc.; also the following

K. & M.

GRANULATED EFFERVESCENT

MINERAL WATER SALTS:

Vichy, Kissengen Seltzer, Carlsbad, Congress, Crab Orchard, Pullna, Friedrichshall, etc., etc.

SHADY LAWN,

GOTHIC STREET, NORTHAMPTON, MASS.

ENLARGED NOVEMBER, 1876.

A MEDICAL HOME FOR INVALIDS:

Diseases of the Mind and Nervous System;
Medical and Surgical Treatment of Ailments of Women.
The Alcohol and Opium Habits.

A. W. THOMPSON, A.M., M.D. (CANTAB.)

Formerly of Northampton Lunatic Hospital. Ex-President Hampshire Medical Society.

THE FOLLOWING COURSE OF INSTRUCTION —IN— **Ophthalmology and Otology**

WILL BE GIVEN AT THE

N. Y. Ophthalmic and Aural Institute,

No. 46 East 12th Street,

From March 1st to the beginning of June.

1.—**Histology of the Eye and Ear.** By Dr. E. GRÜNING.
2.—**Physiological Optics and Acoustics.** By Dr. H. Knapp.
3.—**Ophthalmoscopy and Otoscopy.** By Dr. T. R. Pooley.
4.—**Functional Examination of the Eye and Ear.** By Dr. E. GRÜNING.
5.—**Practical Exercises in Operating.** By Dr. H. KNAPP, assisted by Dr. T. R. POOLEY.
6.—**Ophthalmic and Aural Clinics.** By Dr. H. KNAPP.

The first five courses will be given once a week; the clinics three times a week. The students will have the privilege of attending the daily Dispensary and witnessing the operations.

Fee for the whole course, $30; for each course taken separately, $10.

PRACTICAL INSTRUCTION IN

CUTANEOUS AND VENEREAL DISEASES,

AT CHARITY HOSPITAL, BLACKWELL'S ISLAND, N. Y.,

By H. G. PIFFARD, M.D.

Course, 20 Lessons. Class limited to Three. Fee, $50.00 each.

For information and reference, apply at 10 WEST 35TH STREET, CITY.

A PHYSICIAN of eight years' experience, a M.R.C.S. L., is desirous of entering into an arrangement with another Physician, practicing in New York or Brooklyn, either as his partner or assistant, or with a view to purchase of practice in the event of his retirement. Excellent references. Address F. A. H., 27 Great Jones Street, N. Y.

SUNNYSIDE.

A PRIVATE MEDICAL HOME FOR NERVOUS INVALIDS.

Washington Heights, New York.

This Home, unsurpassed for its beauty of location and surroundings and with handsomely furnished apartments, receives a limited number of cases of either sex, of *Mental* and *Nervous Diseases, Dipsomania* and *Opium Habit,* and offers to such patients all the attentions, comforts and attractiveness of a home, together with medical treatment. Applications may be made either by mail or personally at 183d St., bet. 10th Ave. and Boulevard.

Twelve trains daily from Hudson River Depot, 30th St. and 10th Avenue. DR. EDWARD C. MANN, M.D., late Medical Superintendent N. Y. State Emigrant Insane Asylum. DR. WM. H. B. POST.

THE PRIVATE INSTITUTION FOR

FEEBLE-MINDED YOUTH,

AT BARRE, MASS.,

Established June, 1848.

Offers to parents and guardians, superior facilities for the improvement of this class of persons, and the comforts of an elegant country home.

A few cases of *Insanity,* of mild type, have always been received.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,	**With Hops (Plain),**		**$1 00**
"	"	**Pyrophosphate of Iron (Ferrated),**	**1 00**

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL, and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist,

Explanatory Circular mailed on application.

(P. O. Box 4,517), 2 and 4 Platt Street, New York

LOEFLUND'S EXTRACT OF MALT

Is recommended to physicians for its **purity** and **superiority** over all others. It is perfectly free from **Alcohol, Carbonic Acid and Empyreumatic Products**, which can only be attained by the **most careful manipulations** in its manufacture, **long experience**, and by means of **unexcelled apparatus**. Mr. Ed. Lœflund, of Stuttgart, Germany, manufactures only Malt preparations, devotes his whole time to these; and being a thorough Chemist, makes a preparation based upon **scientific principles**. For this reason his Preparations were awarded a **prize** at the **Centennial Exhibition**. **Lœflund's Concentrated Extract of Malt** is a **Resolvent Emollient** and most powerful **Nutritient**. It is used for diseases of the **respiratory organs, pulmonary complaints**, and for diseases originating in **imperfect digestion**. **Price per bottle, 75 cents.**

Lœflund's Extract of Malt with **Pyrophosphate Iron.**
" " " **Citrate Iron and Quinine.**
" " " **Iodide Iron.**

Lœflund's Extract of Malt with **Hypophosphite Lime.**
" " " **Pepsin.**
" " " **Hops.**

Each of these **$1.00 per bottle.**

Lœflund's Concentrated Leibig's Food for Infants (Leibig's Soup for infants in a concentrated form), **ready for use**, has been pronounced by the Judges of the Centennial Exhibition: **A perfect Substitute for Mother's Milk**, and therefore awarded a prize. Price, 75 cents per bottle.

Circulars giving full particulars will be mailed to all parts upon application.

CAUTION TO THE TRADE AND PUBLIC.—The labels on Lœflund's Preparations should be carefully examined. The signature of ED. LŒFLUND appears on the right lower corner of the genuine label; in the centre, the *Trade-Mark*; and on the *left lower corner*, the words: Sole Agent for America, ALBERT C. DUNG, Druggist, 61 Bowery, New York.

The genuineness of these only is guaranteed. All labels are printed in the *English Language*.

Lœflund's Extract of Malt Lozenges contain a large proportion of **Extract of Malt**, and are **very efficacious**, as well as highly agreeable **Cough Lozenges**. Price 25 cents per package.

All the above preparations are kept by the leading druggists. Orders by mail promptly filled by

ALBERT C. DUNG, 61 Bowery, New York.

VACCINE VIRUS.

In order to meet properly the continued demand upon us for **Animal Virus,** we have established stables for its propagation upon carefully-selected heifers. The lymph used is of the well-known "Beaugency" stock, imported by ourselves expressly for this purpose. The result of several years' experience in supplying this lymph leads us to believe that its excellence is unsurpassed. The establishment is under the care of a competent physician, who will spare no pains to produce a perfectly **reliable** and **pure** article, which we are prepared to furnish **fresh, daily.**

We can also furnish, to those who prefer it, **Humanized Virus,** from healthy children, procured for us by physicians of undoubted reliability.

All our Virus is put up in strong, *air-tight, sealed packages,* for safe conveyance by mail or express, and will be sent (postpaid if by mail) upon the following terms:—

From the Heifer, 10 large Ivory Points, well charged on both sides	$1.50
5 large Ivory Points, " "	.80
Large Ivory Points, less than 5, " " each	.25
1 Crust, new method, in air-tight Glass Capsule	2.00
From Healthy Infants, 10 small Ivory Points	1.50
1 Crust from Unruptured Vesicles	2.00

Directions for vaccinating with either form of Virus, derived from methods successfully employed, will be furnished with Virus if requested.

We will warrant every package of Points and every Crust, giving a fresh supply in case of failure reported within fifteen days for Points, thirty days for Human, and ninety days for Kine Crusts. We can usually furnish Crusts one remove from the heifer if preferred.

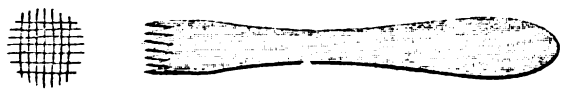
On account of their unreliability, we have hitherto furnished the usual form of Kine Crust unwillingly. Under our new method of taking and preserving them, however, after careful tests and an experience extending over several months, the results obtained have been so satisfactory that we now offer them as not less active and reliable than other forms of Virus, while less liable to become inert with lapse of time. We now offer them on very favorable terms, and recommend them for transmission to a distance, and in all cases where it is desired to preserve Virus for some weeks or months, or to keep a supply at hand for emergencies.

We also furnish **Uncharged Ivory Points,** for physicians' use, at the following rates:—

Small	per 100, 25 cents; per 1,000, $2.00
Large	per 100, 50 cents; per 1,000, 4.00

Orders by mail or telegraph answered by return train.

Liberal discounts upon large supplies for Cities, Towns, and Institutions.



Scarifying Vaccinator, Steel Nickel-Plated. See Cut. Each 25 Cents.

TO THE MEDICAL PROFESSION.

MALTINE.

(EXTRACT OF MALTED BARLEY, WHEAT AND OATS.)

THIS PREPARATION CONTAINS FROM THREE TO FIVE TIMES THE MEDICINAL AND NUTRITIVE ELEMENTS FOUND IN EXTRACT OF MALT.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat* and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST: In the manufacture of ***MALTINE*** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates and Albuminoids on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity possessing little virtue aside from the saccharine matter which it contains.

SECOND: *Carbon*, *Hydrogen*, *Nitrogen*, *Phosphorus*, *Sulphur*, *Iron*, *Magnesium* and *Potassium* are essential elements in the food of man; and it is only in ***MALTINE***, containing the combined properties of malted *Barley*, *Wheat* and *Oats* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD: *Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. ***MALTINE*** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH: LIEBIG says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley in the manufacture of ***MALTINE*** is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of ***MALTINE****, and would request a trial and comparison of merits with any article offered for similar uses.*

MALTINE AND ITS COMPOUNDS

Can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, Imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULAS AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**
This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOS. IRON AND QUINIA:**
A powerful general and nutritive tonic.

***MALTINE* WITH PHOS. IRON, QUINIA AND STRYCH.:**
A powerful nutritive, general and nervous tonic.

***MALTINE* WITH HYPOPHOSPHITES:**
This preparation is specially indicated in Phthisis, Rickets and deficient Ossification.

***MALTINE* WITH PEPSIN AND PANCREATINE:**
One of the most effective combinations in Dyspepsia, Cholera Infantum and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE***. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**
One of the most valuable combinations in cases of general Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH COD LIVER OIL:**
The most perfect emulsion, and most agreeable and effective mode of administering this nauseous but valuable Oil yet discovered.

***MALTINE* WITH COD LIVER OIL AND PHOSPHORUS:**
In this combination the Phosphorus has no irritant effect upon the stomach.

***MALTINE* WITH COD LIVER OIL AND IODIDE OF IRON:**
This is prepared with the tasteless Iodide of Iron, which undergoes no chemical change from contact with the Oil, and does not blacken the teeth.

***MALTINE* WITH ALTERATIVES:**
In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.
Each fluid ounce contains: *Chloride Calcium*, 10 grains; *Chloride Magnesium*, 10 grains; *Bromide Sodium*, 5 grains; *Iodide Potassium*, 1 grain; *Iodide Iron*, ½ grain. DOSE, One teaspoonful to one tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only*.

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in amber bottles holding sixteen fluid ounces; each bottle inclosed in a folding paper box.

THE BEST IS THE CHEAPEST.

"IN Burr's improved Nursing Bottle all objections have been successfully overcome."

BURR'S Nursing Bottles

have been recommended and indorsed by all the leading Physicians and Druggists for the past ten years.

They are made of the very best and purest material, and by the most skilful workmen.

Nursing bottles and tubes should be thoroughly cleansed immediately after using. This is of the greatest importance, as the life of the infant depends on it.

It is almost impossible to get at the tube of the imitation Nursing Bottles in order to clean them. Carelessness in this respect is to be carefully guarded against, and the mother should look to it that this advice is followed. Restlessness, gastric irritation, griping pains and fits of screaming are the consequences of neglecting this matter, and ignorant people blame the bottle, when these results should be attributed to the carelessness of the nurse and want of cleanliness of the bottles and tubes.

The genuine BURR'S IMPROVED NURSING BOTTLE, the nipple-holder, tube-connector and mouth-guard are all ingeniously combined in one piece of hard, polished wood. It is so constructed that the nipples are firmly held, yet they can be easily taken off for cleaning the tubes, and replaced in an instant.

AVOID DANGER

Among nursing bottles where the nipple-holder, mouth-guard and tube connector are of metal, or in more than one piece.

The genuine Burr's Improved Nursing Bottles are made in eight different styles, and retail at from twenty-five to seventy-five cents.

See that the patent stamps are on the mouth-guard and stopper, and the words "Burr's Patent Nursing Bottle" are blown in each bottle.

NEAVE'S FOOD

FOR
INFANTS
AND
INVALIDS,

Is pre-eminently rich in albumenoids and phosphates, and the starch which it contains is in a state readily assimilated by the infantile digestion.

NEAVE'S FOOD has received the high and unqualified approval of eminent medical men for many years past. It usually commands a ready sale, both in Great Britain and in the States, for it is strongly recommended by mothers to the notice of their lady friends; and infants often give it a preference, refusing other foods. As a natural result, the sale has extended rapidly, especially during the past four years, necessitating the erection of extensive premises, again enlarged in December, 1876, where the preparation is carried on under the personal supervision of Mr. Neave.

NEAVE'S FOOD is sent in large quantities to the Colonies and to the United States. It is prepared with special reference to exportation.

NEAVE'S FOOD is sold in tins and tinfoil packets by chemists and storekeepers at home and abroad.

For terms, apply to any wholesale or export house, or to manufacturers,

JOSIAH R. NEAVE & CO., Fordingbridge, England.

☞ Doctors and Medical Practitioners wishing to try Neave's Food are requested to apply for a Sample Packet (gratis) at the undermentioned Agency.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of CASWELL, HAZARD & CO., New York, and of all respectable Chemists throughout the world.

EVER BROUGHT TO THIS COUNTRY,

STRICTLY FOR MEDICINAL USE,

Respectfully informs the members of the Medical Profession that he has opened an office at

13 West 11th St., New York.

Those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES**, which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:

This is to Certify, that I have examined Mr. L. REICH'S TOKAYER AUSBRUCH, TOKAYER MASLAS, and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.

Prof. of Chemistry and Toxicology in Bellevue Hospital Med. Col., and Prof. of Chemistry and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. Reich and his Wines to our professional brethren.

J. MARION SIMS, M.D.,
Late Surgeon to the Woman's Hospital, N. Y.

ALFRED L. LOOMIS, M.D.,
Prof. of Pathology and Practice of Medicine, Univ. of City of New York.

STEPHEN SMITH, M.D.,
Professor of Orthopœdic Surgery, University of the City of New York.

HENRY B. SANDS, M.D.,
Professor of Anatomy. College of Physicians and Surgeons.

JAMES R. WOOD, M.D., LL.D.,
Professor of Surgery, Bellevue Hospital Medical College.

LEWIS A. SAYRE, M.D.,
Prof. of Orthopœdic Surgery and Clinical Surgery, Bel. Hosp. Med. Col.

W. H. THOMPSON, M.D.,
Prof. of Materia Medica and Therapeutics, Univ. of City of New York.

LOUIS F. SASS, M.D.,

C. HEITZMANN, M.D.,

J. L. LITTLE, M.D.,
Professor of Surgery, University of Vermont.

J. LEWIS SMITH, M.D.,
Late Clinical Lecturer on Diseases of Children, Bel. Hosp. Med. Col.

MONTROSE A. PALLEN, M.D.,
Professor of Gynæcology, University of City of New York.

JOHN SWINBURNE, M.D.,
Professor of Fractures and Dislocations and Clinical Surgery.

ALBERT VAN DERVEER, M.D.,
Professor of the Principles and Practice of Surgery.

JACOB S. MOSHER, M.D.,
Registrar, and Professor of Medical Jurisprudence and Hygiene.

JOHN M. BIGELOW, M.D.,
Professor of Materia Medica and Therapeutics.

LEWIS BALCH, M.D.,
Professor of Anatomy.

SAMUEL R. WARD, M.D.,
Professor of Surgical Pathology and Operative Surgery.

EDWARD R. HUN, M.D.,
Professor of Diseases of the Nervous System.

JAMES P. BOYD, M.D.,
Professor of Obstetrics and Diseases of Woman and Children.

THOMAS HUN, M.D.,
Dean of the Faculty, and Emeritus Professor of the Institutes of Medicine.

S. O. VANDER POEL, M.D.,
Professor of Theory and Practice, and Clinical Medicine.

DANIEL M. STIMSON, M.D.,
Formerly Prof. of Surgery in Albany Medical College.

The Wines will be shipped to any part of the United States.

Physicians wishing to test these Wines will, on application, be furnished with an original bottle at half price.

Western Electric Manufacturing Co.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,

GALVANIC BATTERIES,

BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8½ x 7¼ x 4½. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

WESTERN ELECTRIC MANUFACTURING CO.

20 New Church St., NEW YORK. 220 to 232 Kinzie St., CHICAGO.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 8¼ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

LAZELL, MARSH & GARDINER'S POWDERED MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts.*

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.		per oz.
Powd. Ext. Aconite Leaf	.40	Powd. Ext. Jalap	.40

NELATON'S CATHETERS,

Sometimes called Jacques', but really the invention of Dr. Nelaton, Surgeon to the late Emperor Napoleon III., have, by their decided advantages over every other kind, become a necessity in the practice of the leading Physicians and Surgeons of Paris, London, and other European Cities.

Their introduction here has been so successful that imitations are already in the market, much inferior in quality. Having secured a large stock from the original manufacturers during my stay in Paris, I am enabled to offer the genuine at a reasonable price.

These are made of *pure brown rubber*, with a smooth, soft surface, delicately flexible; and if the simple directions on the box are followed, their introduction will cause little or no pain, and effect their purpose much more easily and effectively than any other kind.

Sets of nine sizes, numbered and with wire, the whole neatly boxed, will be sent by mail on receipt of $6.00. THEO. RICKSECKER, 146 & 148 WILLIAM ST., NEW YORK.

Please mention MEDICAL RECORD.

CHAMPION SPOUTING SPRING NATURAL WATER
FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast.

and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

FOOD IS THE BEST TONIC!!

TRADE MARK.

MENSMAN'S

PEPTONIZED

BEEF TONIC.

The great necessity for a fluid food that would possess **all the elements necessary for the support of the system**, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared after a thoroughly tested and scientific method.

PROPRIETORS,

PHOSPHORUS COMPOUNDS

AND OTHER NEW ADDITIONS TO

McKesson & Robbins' Gelatine-Coated Pills.

PHOSPHORUS, DIGITALIS & EXT. HYOSCYAMUS,

Phosphorus	1-50 gr.
Pulv. Digitalis,	1 gr.
Ext. Hyoscyami,	1 gr.

Pronounced a valuable medicine as a heart tonic. The tonic effect of Digitalis on the involuntary muscular fibre is claimed to be analagous to that of Strychnine on the involuntary muscular system. Dose, 1 pill two or three times a day, at equal intervals, which should be ommitted when effect is produced upon the head, stomach, pulse or kidneys.

PHOSPHORUS & EXTRACT ACONITE,

Phosphorus,	1-50 gr.
Ext. Aconiti Alc.,	1-16 gr.

A combination recommended by an eminent English physician in the treatment of Phthisis with Pyrexia. Dose, 1 pill every four hours.

PHOSPHORUS & EXT. CANNAB INDIC.,

Phosphorus,	1-50 gr.
Ext. Cannab Ind.,	1-4 gr.

A good narcotic, when Morphia should not be administered, and recommended as an aphrodisiac in the place of Nux Vomica. Dose, one or two pills two or three times a day with food.

PHOSPHORUS, Ext. NUX VOM. & Ext. ALOES,

Phosphorus,	1-50 gr.
Ext. Nucis Vomicæ,	1-4 gr.
Ext. Aloes Soc.,	1-2 gr.

A good dinner pill, useful in atonic dyspepsia, hypochondria and other nervous affections accompanied by habitual constipation. When, in administering, for some time, Phosphorus and Iron, or Phosphorus and Quinine, constipation is induced, this pill may be substituted with advantage once a day between doses. Dose, one immediately after dinner.

PHOSPHORUS, Ext. NUX VOM. & CARB. IRON,

Phosphorus,	1-50 gr.
Ext. Nucis Vomicæ,	1-4 gr.
Ferri Carb,	1 gr.

Dose, one or two pills at each meal with food.

PHOSPHORUS IRON & ALOES,

Phosphorus,	1-50 gr.
Ferri Sulph. Exsic.,	1 1-2 grs.
Ext. Aloes Soc.,	1 gr.

PHOSPHORUS, MORPHIA & VAL ZINC.

Phosphorus,	1-50 gr.
Morphiæ Sulph.,	1-12 gr.
Z nzi Valerianas,	1 gr.

Recommended as a quieting influence in Phthisis when there is hysterical irritability and hacking cough without much fever. Dose, one pill two or three times daily, or two upon going to bed.

PHOSPHORUS, NUX VOMICA & CANTHARIDES,

Phosphorus,	1-50 gr.
Pulv, Nucis Vomicæ,	1 gr.
Tinct. Canthar. Conc.,	1 minim.

Recommended as a gentle stimulant to the genito-urinary organs, a useful remedy in incontinence and retention of urine, and in premature loss of sexual power. Also successfully prescribed in some cases of Amenorrhœa and Leucorrhœa. Dose, one or two pills two or three times a day with food,

PHOSPHORUS & QUININE,

Phosphorus,	1-50 gr.
Quiniæ Sulph.	1 gr,

Physicians can readily see the value of this pill as a nutritive tonic.

PHOSPHORUS, QUINIA, IRON & STRYCHNIA,

Phosphorus,	1-100 gr.
Quiniæ Sulph.,	1 gr.
Ferri Redact.,	1 gr.
Strychnia,	1-60 gr.

By some preferred to Pills of Phosphates Iron, Quinine and Strychnine.

PHOSPHORUS & STRYCHNIA,

Phosphorus,	1-50 gr.
Strychnia,	1 60 gr.

PHOSPHORUS SULPH., ZINC, & LUPULIN,

Phosphorus,	1-50 gr.
Zinci Sulphas,	1 gr.
Lupulina,	1 gr.

***ALL* of McKesson & Robbins' Gelatine-Coated Pills can be found at my Pharmacy.**

T. H. SAYRE, Dispensing Chemist, 6th Av., cor. 46th St., New York.

On receipt of $1.00, I will mail to Country Physicians Samples of ANY or ALL kinds of the above pills as they may direct.

NOTICE.—See our Advertisement, page 8.

Extract of Malt

WITH

COD LIVER OIL.

Our Improved Extract of Malt with 50 per cent of our fine Norwegian Oil, is pre-eminently THE emulsion of Cod Liver Oil, since it *has double the nutritive effect of any other emulsion of oil.* It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or gramineous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that IT UNITES PERFECTLY WITH WATER IN ANY PROPORTION, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

DOSE.—A Dessert to Tablespoonful immediately after Meals.

Prepared with the most scrupulous care

" Ferri Pomate, " " " "					$1 00

Prices inclusive of jars and bottles.

MATHIAS ROZSNYAY,

Arad, Hungary,

Begs leave to inform the Medical Profession that he has given his sole agency and the exclusive control of his prenaration of

TASTELESS QUININE,

Neutral Tannate of Quinine,

To Mr. F. ALFRED REICHARDT, who keeps full stock of his preparations.

The discovery of Mr. Math. Rosanyay to make an *absolutely tasteless and reliable* preparation of Quinine is one of the most important in modern therapeutics. The ordinary Tannate of Quinine, as made in chemical works, is obtained by precipitating the mother liquor, of which Quin. Sulphate has crystallized out, by an addition of Tannic Acid. First, this is an acid or bi-tannate, and contains likewise all the other Cinchona Alkaloids, Quinidia, Cinchonidia, Cinchona, Quiniodin, etc., the little intrinsic value of which is best proven by the price lists of large German manufacturers who quote this salt at only one-sixth of the value of the Sulphate. The *neutral* Tannate of Quinia has also great advantages over the Sulphate, as it does not cause the same cerebral and digestive troubles, as has been fully proved by the report of the commission appointed by the Academie de Medicine, in Paris, on a memoir presented by Mr. Bonesiere. The commission consists of Messrs. Orfila, Bussy & Bouvier; their names are sufficient proof for the thoroughness of their researches.

I guarantee that this Neutral Tannate contains in 2½ grains the same percentage of pure Quinine as is contained in 1 grain of the Sulphate, and that its effects in equivalent doses are the same as that of the Sulphate. In treatment of diseases of children and persons of delicate taste, it is of the highest value. It is also put up in Chocolate Lozenges, containing each 2½ grs. of Tannate, 2 doz. in a box. Pamphlet sent free on application. Price per box, $1.00. Per ounce, $3.00.

FRANCIS J. GEIS,

Brewer and Maltster, Dobbs' Ferry, N. Y.,

PURE EXTRACT OF MALT.

Sole Agent for the U. S. and Canada, F. ALFRED REICHARDT.

This extract is absolutely pure and superior to **any other** make, foreign or domestic. Made without addition of hops, ginger, and guaranteed to be free from any substance whatsoever foreign to the best barley malt and distilled water. It is also the *cheapest* in the market. Put up in neat 1 lb. jars at 50c. per jar, or $3.75 per gallon, jar inclusive.

F. ALFRED REICHARDT,

Late Helmick, and Helmick & Co.,

Fluid Extract of Damiana.

The most effective preparation made under this name. It is a very efficient uterine tonic of the highest value in Impotency, Prostatitis, Spermatorrhœa, Suppressed Menses, and Catarrh of the Bladder. Its tonic action is as certain as that of Quinine. Put up in bottles of 6 oz. $2.00 per bottle. $16.00 per doz. Pamphlet sent gratis on application.

NITRITE OF AMYL PEARLS.

Made from Dr. E. Squibbs' Nitrite of Amyl. The only ones in the market of correct dosage. 2 and 3 drop, 75c. per doz. 5, 8 and 10 drop, $1.00 per doz.

IODOFORM, CRAYON'S.

Dr. Leblond's formula for Ulcerations of the Cervix. $1.00 per doz.

APIOL CAPSULES,

Absolutely pure. Containing 6 drops. The *only pure* of domestic make. $5.00 per 100.

BRUSH-HOLDING RUBBER STOPPLES.

90c. per doz.

F. ALFRED REICHARDT, Pharmacist and Importer, 404 Fourth Ave., N. Y.

GANOT'S PHYSICS.

An Elementary Treatise on Physics, Experimental and Applied. For the use of Schools and Colleges. Translated and Edited from Ganot's "Eléments de Physique," with the author's sanction. By E. ATKINSON, Ph.D., T.C.S., Professor of Experimental Science, Royal Military College, Sandhurst.

In one thick large 12mo volume of over 900 pages, profusely illustrated by Chromo-lithographic Plates, and 762 fine wood engravings. Price $5.00.

The Publishers take pride in offering this beautiful work of Prof. Ganot. It has no rival, we believe, in the English language. It is fully up to the times in every particular, and no expense has been spared to make it typographically a model text-book. As a book for the library of the scholar and gentleman it is invaluable, giving concise information on every branch of Physical Science.

Sent by mail, post-paid, on receipt of price.

WM. WOOD & CO., Publishers, 27 Great Jones Street, New York.

SPECIMENS OF THE ILLUSTRATIONS.

In corresponding with Advertisers please mention **The Medical Record.**

A FEW FACTS.

It is generally conceded, that, although the Drug Stores are usually well supplied with numerous styles of Enema Syringes, yet, it has heretofore been impossible for Physicians, or those requiring instruments of this kind, to obtain a really first-class Syringe; although exorbitant prices have been paid for several of the more prominent bulb Syringes, simply because the patents of certain manufacturers, were supposed to grant an entire monopoly, in the manufacture of this article.

When we consider the very just prejudice against lead pipes, for conveying or holding a liquid intended to be taken into the system, it seems strange, that an instrument so exceedingly useful as the Syringe, should have been heretofore made with Lead pipes and attachments; simply brushed over the polished surface, with a thin Alcoholic Varnish, or "*Laquer*," to prevent them from tarnishing, until sold or used. A prominent Physician recently remarked, "that he would as soon think of wearing artificial teeth made with lead or britannia plates, as to recommend a metallic Syringe subject to the same poisonous corrosion."

Therefore we arrive at the fact, that a Syringe should not only be mechanically perfect in its construction and action, but the tubes and attachments, should certainly be made of either Gold, Hard Rubber, Platina or Nickel.

Dr. De Henrie's **"Gold Favorite"** and **Nickel Plated** Syringes, answer all these requirements.

A GOLD SYRINGE,

The constantly increasing favor with which the medical faculty and the public have received DR. DE HENRIE'S improved Nickel plated Syringes, has induced us to introduce a new and valuable novelty in Bulb Syringes to which the attention of physicians and the trade is respectfully solicited. "DE HENRIE'S GOLD FAVORITE" is certainly the most elegant syringe yet manufactured. The metal attachments are made of the purest white metal and nickel, heavily plated with 24 *carat gold*. This substantial plating extends throughout the inside of the tubes, and renders the syringe as pure and valuable for all practicable purposes as though the parts were solid gold. We wish it clearly understood that the "Gold Favorite" is not merely gilded, but substantially plated with pure gold, done in our own factory under the personal supervision of our Mr. Sutton. The rubber bulb and tubing is the finest made, and will not become hard or lose its elasticity, purity and durability being the object obtained.

The "Favorite Syringes," whether gold or nickel-plated are a decided improvement over those made with two elastic tubes extending from each end of the bulb, as the "Favorite" possesses all the merits claimed for a bulb held horizontally, while the valves work vertically which insures a perfect and easy action of the Syringe.

The rigid inlet pipe is conveniently held in the fluid to be injected; operating as a hand-rest, a great convenience to invalids.

De Henrie's "GOLD FAVORITE" Syringes are warranted perfect in every respect, and are justly entitled to rank as the *leading instrument* among Syringes both in this country and abroad

The "GOLD FAVORITES" are all furnished in our patent polished walnut cases, lined with silk velvet, and are sold by leading druggists throughout the world.

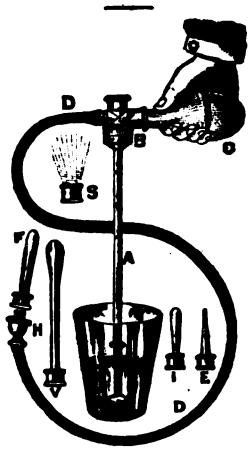
Wholesale price, $30.00 per dozen

Dr. DeHenrie's Favorite Syringe.

Practical experience, and an earnest desire to overcome the many faults found in the construction and operation of the syringes heretofore sold, resulted in the invention of the "FAVORITE" which was introduced to the trade in April, 1877. It immediately became, as the name implies, a "Favorite" with the profession and the public, being ordered by the United States Government for use in the medical department of the United States army, and endorsement and praise of the authorities both here and in France, while the sales have been unprecedented This Syringe was introduced for favor entirely upon *its own merits*, and has achieved these results simply because of the following points of superiority. It possesses all the merits of a syringe with two elastic tubes—that of drawing liquid from a deep vessel, and the convenience of operating the bulb horizontally, while the *serious objections* to syringes of this style, such as the difficulty of keeping the rubber inlet-tube in the fluid (particularly when it becomes bent to the shape of the box), and the absence of a hand-rest making it fatiguing to pump with an extended hand, are all overcome in the FAVORITE, as the rigid suction pipe maintains a perpendicular position in the fluid, and can be easily handled, while it serves as a hand-rest, a comfort to ladies and feeble persons. As the outlet valve is located at the end of the elastic tube (*not at the bulb*), the fecalized fluids from the rectum are prevented from passing into the rubber tube, therefore it cannot become offensive. The valves work vertically, and are carefully fitted, so that every valve works snug and true, and are not liable to clog or get out of order. The bulb discharges the fluid in a direct line with the discharge pipe; being the only syringe having this valuable improvement of a bulb operating horizontally at right angles to the inlet tube, thus making it the easiest syringe known for an invalid to operate, never tiring the hand; while the old style, having the bulb standing upright on top of the suction pipe, must necessarily require more exertion, as the fluid is pressed against the valve and forced around an acute angle, requiring strength to operate it. One trial of De Henrie's Syringe is convincing that it is the best to recommend to an invalid or to ladies.

De Henrie's Favorite is elegantly NICKEL PLATED; making the metallic parts pure as glass for use. Each syringe is packed in a handsome polished walnut case, fitted with compartments for each part. As a syringe for family use it has no equal, being composed of tubes for the injection of male adult, female vagina, children, eye, ear, and a spray for inflamed surfaces. Wholesale price, $12.00 per dozen.

Explanation of Dr. De Henrie's Improved Favorite Syringe.

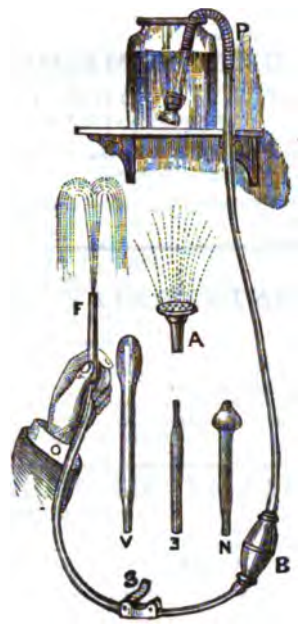


A—Suction Pipe, with Valve at **B**. **C**—Rubber Bulb, connects with A at **B**. **D**—Flexible Tube of the Finest Rubber. **H**—Outlet Valve Chamber. **F**—Injection Tube for Bowels of Adults or Children. **V**—Vaginal or Female Tube. **I**—Infant Tube, **E**—Ear Tube. **S**—Spray Cap for the Eye or inflamed Surface.

All enclosed in elegant, polished Walnut Boxes fitted with our patent compartments for keeping the tubes in place, and prevent them from rattling when carried.

The metalic parts are thickly plated with Gold or pure Nickel. The Rubber Bulb and Tubing is the *finest made*. The action is easy, and the valves fit perfectly, therefore the Syringe injects no air.

THE DE HENRIE SIPHON.



P, Spiral Coil, prevents the rubber tube from slipping out of the vessel; **B**, small rubber bulb, one compression starts the flow; **S**, improved stop cock; **F**, male tube; **V**, Vagina or Female Tube; **E**, Ear Tube; **N**, Nasal Douche; **A** Spray for inflamed surfaces.

This already famous Syringe is conceded by physicians to be the most convenient and useful article yet introduced; our cut is a fair illustration of its actual merits.

It acts automatically, dispensing with the pumping attendant upon the use of Bulb Syringes, and is designed as a decided improvement on the well-known water bag or "Fountain Syringe." In this Syringe we dispense with the rubber bag, which is so liable to crack or become leaky, and instead we use any convenient vessel for holding the liquid to be injected, simply placing the vessel upon the washstand bureau or mantel or suspended above the head, for injecting any quantity of fluid, from an ounce upward. A single compression of the small bulb **B** (see cut) starts the flow which continues whenever the stop-cock **S** is open. The hydrostatic pressure is invariably sufficient for vaginalor ordinary injections of the rectum or bowels, or a slight compression of the bulb increases the force when necessary to remove hardened feces from the rectum. As a nasal douche it has no equal. Each syringe complete with tube for male, female and infant, ear, nasal tube, and sprinkler. The metalic parts are manufactured of the purest white Britannia. nickel plated, all enclosed in a polished patent walnut case.

Wholesale Price, $15 per dozen.

Complete Price List of De Henrie's Syringes.

De Henrie's Gold Favorite (patent velvet case).....$30.00 per dozen.
De Henrie's Nickel Favorite (patent walnut case).....$12 00 per dozen.
De Henrie's Siphon Syringe (patent walnut case).....$15.00 per dozen.
De Henrie's No. 101 Syringe 3 pipes, $6.00 "
De Henrie's No. 93 Syringe 3 pipes, $5.00 per dozen.
De Henrie's No. 75 Syringe 2 pipes, $4.50 per dozen.
" No. 57 Syringe 2 pipes," $4.00 per dozen.

Sample Syringes to the Trade or Physicians at dozen rates.

Our Syringes are protected by letters patent of May 15, 1877, May 22, 1877, January 18, 1878.

OF THE
UNIVERSITY OF BUFFALO,
BUFFALO, N. Y.

Session of 1877-78.

Preliminary Term begins.....Oct. 3.
Regular Term " .....Nov. 7.

FEES.—Matriculation, $5.00. Faculty, $100.00. Perpetual Ticket, $150.00. Graduation Ticket, $25.00.

THOMAS F. ROCHESTER, M.D., Dean,
Buffalo, N. Y.

MIAMI MEDICAL COLLEGE
OF CINCINNATI.

Next Session will commence October 3d, 1877. Professors' Tickets, $40.00.

FACULTY.—JOHN A. MURPHY, M.D., Dean; E. WILLIAMS, M.D.; WM. CLENDENIN, M.D.; WM. H. TAYLOR, M.D.; J. B. HOUGH, M.D.; W. H. MUSSEY, M.D.; T. H. KEARNEY, M.D.; J. C. MACKENZIE, M.D.; W. B. DAVIS, M.D.; BYRON STANTON, M.D.

For Circulars, address JOHN A. MURPHY, M.D.,
No. 163 West 7th Street.

STARLING MEDICAL COLLEGE,
COLUMBUS, OHIO.

The Thirty-first Session of Starling Medical College will commence October 4, 1877, and continue until March, 1878. It will be preceded by a preliminary course beginning September 1, 1877. Extensive additions have recently been made to the Museum and other teaching facilities of the College.

Francis Carter, M.D., Emeritus Professor of Obstetrics and Diseases of Women and Children, and Dean of the Faculty.
H. G. Landis, A.M., M.D., Professor of Obstetrics.
Sam'l D. Turney, M.D., Professor of Diseases of Women and Children.
Theo. G. Wormley, M.D., LL.D., Ph.D., Professor of Chemistry.
James H. Pooley, M.D., Professor of Surgery.
Starling Loving, M.D., Professor of Practice of Medicine.
John M. Wheaton, M.D., Professor of Anatomy.
R. B. Fullerton, M.D., Professor of Materia Medica and Therapeutics.
W. J. Conklin, M.D. (of Dayton), Professor of Physiology.
W. J. Wolfley, M.D., Professor of Opthalmology and Otology.
Alex. Dunlap, M.D., Professor of Surgical Diseases of Women.
Hon. J. W. Baldwin, M.A., Professor of Medical Jurisprudence.
D. A. Morse, M.D., Professor of Nervous Diseases and Insanity.
Otto Frankenberg, M.D., Professor of Pathology.
T. C. Hoover, Prosector to the Chair of Surgery, Lecturer on Minor Surgery and Demonstrator of Anatomy.

College, corner of State and Sixth Sts.; Dean's Office, 181 East State St.; Secretary's Office, 72 East Gay St.

Letters of inquiry should be addressed to the Dean.

PROF. FRANCIS CARTER, M.D., Dean, Columbus, Ohio.

UNIVERSITY OF MICHIGAN.
DEPARTMENT OF MEDICINE AND SURGERY.

The 29th annual course of lectures will commence on Oct. 1, 1878, and continue *nine months*.

Course separate but equal for women.

Matriculation Fee, *paid but once*—Residents of Michigan, $10; non-residents, $25

Annual Dues—Residents of Michigan, $20; non-residents, $35.

Graduation Fee—For all alike, $10.

Send for Circular and Catalogue.

IOWA STATE UNIVERSITY,
IOWA CITY, IOWA.

MEDICAL DEPARTMENT.—SESSION OF 1877-'78.

The next regular course will commence on Wednesday, October 24th, 1877, and continue until the first Wednesday in March, 1878. The preliminary term will begin on Wednesday, October 10th, and continue until the opening of the regular course. Clinical instruction in Mercy Hospital gratuitous. Advanced students will be intrusted with the care of cases. Applicants for graduation will be required to perform operations upon the cadaver. An abundant supply of dissecting material constantly on hand.

FEES.—For the entire Course, $80.00. Matriculation Ticket, $5.00. Demonstrator's Ticket, $5.00. Graduation Fee, $25.00. For further information, address W. F. PECK, M.D., Dean, Davenport, Iowa,

OR, ELMER F. CLAPP, M.D., Sec'y, Iowa City, Iowa.

N. H. MEDICAL INSTITUTION AT
DARTMOUTH COLLEGE.

The *Eighty-second* Annual Course of Lectures begins Aug. 1, 1878, and continues fourteen weeks. Recitations from Dec. 5 to June 20.

FACULTY:—E. R. Phelps, M.D., LL.D., Practice Emeritus; A. Smith, M.D., LL.D., Therapeutics Emeritus; C. P. Hubbard, M.D., LL.D., Chemistry; E. R. Peaslee, M.D., LL.D., Gynecology; J. Ordronaux, M.D., LL.D., Medical Jurisprudence; C. P. Frost, M.D., Practice; P. S. Conner, M.D., Surgery; E. S. Dunster, M.D., Obstetrics; H. M. Field, M.D., Therapeutics; L. B. How, M.D., Anatomy and Physiology.

FEES:—Matriculation, $5; Lectures, $77; Graduation, $25; Recitations, $40.

For Circular, address C. P. FROST, M.D., Dean, Hanover, N. H.

MEDICAL DEPARTMENT OF
HARVARD UNIVERSITY,
BOSTON, MASS.

NINETY-FOURTH ANNUAL ANNOUNCEMENT. (1877-78.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 27th, 1877, and ends the last Wednesday in June, 1878. Persons who hold no degree in arts or science must hereafter pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 24th.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. R. H. FITZ, Secretary, 106 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins February 14, and closes June 25, 1878.

Winter Term begins October 3, 1878; closes January 30 1879.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $5.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar,

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1877, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

MICROSCOPES.

QUEEN'S STUDENTS',

R. & J. Beck's London Microscopes,

AND A LARGE LOT OF

Microscope Accessories and Mounting Materials

ALWAYS ON HAND.

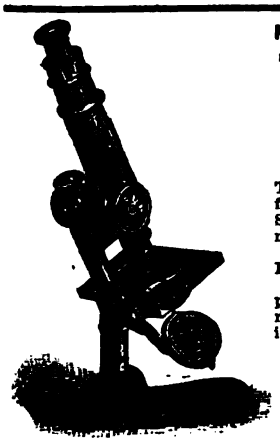
The attention of *Students* is especially called to *R. & J. BECKS' ECONOMIC MICROSCOPES*, similar to those furnished by me to the *University of the City of New York, Medical Department*, and used by Dr. J. W. S. ARNOLD in his lectures.

G. S. WOOLMAN,

116 Fulton Street, New York,

AGENT FOR J. W. QUEEN & CO.

Send for Illustrated Catalogue.



THE NEW MODEL PHYSICIAN'S MICROSCOPE,

Manufactured by the BAUSCH & LOMB OPTICAL CO.,

Under the direct supervision of MR. GUNDLACH.

While elegant in design, it is low and compact, a great advantage for medical and histological purposes The Stage is large and firm, resting on two strong brass arms. The mirror has a very wide range of motion for oblique light, and may be brought above the Stage for the illumination of opaque objects. There is a Sub-Stage, with Diaphragms, which may be placed close to the object or at some distance below it, as the microscopist may wish. Draw tube for increasing power.

The Coarse Adjustment is by rack and pinion, of the best workmanship, and the Fine Movement is by Mr. Gundlach's new device, which has given universal satisfaction.

The Optical Part is of the best quality, and has been specially designed for histological and medical purposes. There are two Eye-pieces, A and C; two Objectives, 3-4 and 1-5, giving eight magnifying powers, ranging from 50 to 375 diameters—sufficient for all ordinary work. There is also a Camera Lucida for drawing, and an eye-piece micrometer with scale and rules for accurate measurement.

PRICE, in Neat Black Walnut Case, with Drawer for Accessories, Lock, Key and Handle, $60.00.

INDUSTRIAL PUB. CO., 176 Broadway, N. Y

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

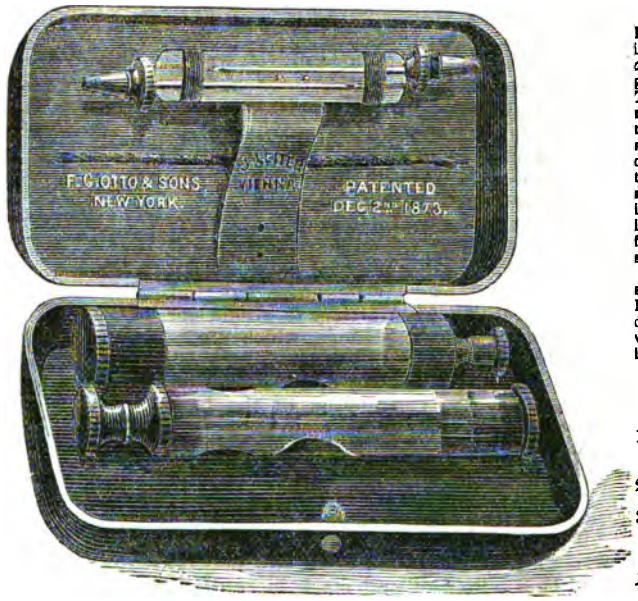
LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.



The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

Durel's Syrup of Tar and Iron.

Prepared by DUREL, Pharmacist, Paris.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron, is a desideratum which has at last been attained in this preparation. The indications for such a remedy are many, but it has been found especially useful in ***Chlorosis, Bronchial Catarrh, Catarrh of the Bladder, Chronic Uterine Discharges***, depending upon an enfeebled or relaxed state of the system.

It is sold by chemists generally.

E. FOUGERA & CO.'S
MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for **administering liquid preparations** or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of **Ether; Chloroform; Oil of Turpentine; Apiol;**
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

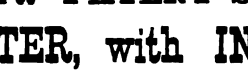
The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

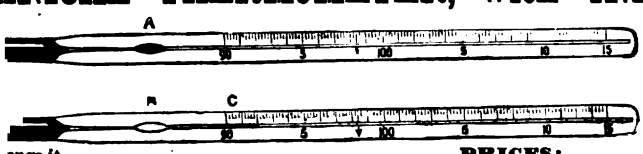
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of



Pharmacien, No. 40 Rue Bonaparte, Paris,
without which none are genuine

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING
CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in travelling, can possibly d ange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $6 00
also offer:
No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 3 50

t free by mail on receipt of price. Manufactured by L. CASELLA, London.

Clinical Professor of Surgery.

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 19, 1877, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Third of October, 1877, and end about the 1st of March, 1878.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals, with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge.*

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Demonstrator's fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

For further particulars and circulars, address the Dean,

Prof. CHAS. INSLEE PARDEE, M.D.,

University Medical College, 410 East 26th St., New York City.

Medical Pictures and Portraits

For PHYSICIANS' OFFICES.

Harvey Demonstrating the Circulation of the Blood

A fine photograph, from a valuable engraving.

Size, 7x9 inches, on fine white mount, 13x16. Price, $1.50
Size, 15x18 " " " 22x28. " 4.00
The engraving of the above is entirely out of print.

THE ANATOMICAL LECTURE.

(After Rembrandt.)

A fine photograph, in both size and price same as Harvey, making a fine companion picture.

THE ANATOMIST.

From a painting by the great artist Max of Germany.

It represents a Professor in deep study, sitting by the side of a female subject of great beauty.

A Fine Etching. Price, $1.00
Or, Proof Copies. " 1.25

JENNER VACCINATING A CHILD

Photograph.

Size, 8½x10 inches, on fine white mount . Price, $1.50.

AMBROISE PARÉ.

To this celebrated French surgeon is attributed the introduction or first use of Ligatures, instead of the old mode by the actual cautery. It represents an operation on the leg of a soldier on the battle-field, surrounded by several eminent men who are looking on with great interest. This engraving, now very scarce and rarely found, has been published in fine Photograph, in three sizes, viz.:

7x9 inches, on white mount, 13x16. Price, $1.50
15x18 " " " 22x28. " 4.00
7x13 " on granite " 11x19. " 2.00

HIPPOCRATES.

A fine photograph from an old and valuable engraving.

Size, 11x14 inches. Price, $1.00.

PHOTOGRAPH PORTRAITS OF

(Imperial Size)

SIR ASTLEY COOPER,
DR. JOHN HUNTER,
DR. RICHARD BRIGHT. } Price, 50 cents each.

THE LUNATIC ASYLUM.

This remarkable picture by KAULBACH, represents a scene in the yard of a Mad-House. A group of unfortunates, each one occupied with the ideas of his own fancy. One as a king, another as a miser, and so on. As a composition and study, it is one of great interest.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

ANDRÈ VÈSALE.

A picture of this celebrated anatomist, at work in his attic, listening to approaching footsteps.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

Prof. CHAS. A. BUDD.

A photograph from life of the late Prof. C. A. Budd, and the only portrait approved of by himself and family. A fine likeness.

Imperial size, from life. Price, 50 cents.

OTHER PHOTOGRAPHS ARE IN PREPARATION.

Sent by mail, post-paid, on receipt of price.

WM. WOOD & CO., 27 Great Jones Street, New York.

FOUGERA'S COMPOUND IODINIZED

COD LIVER OIL

Since the introduction of this oil in 1858 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DORFMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

McKESSON & ROBBINS' GRANULES, Gelatine-Coated.

Aconitia.....1-60 gr.	**Mercury, Proto-Iodide**....1-5, 1-4, 1-2 gr.
Arsenious Acid.....1-50, 1-40, 1-30, 1-20 gr.	**Morphia, Acetate**.....1-8, 1-4 gr.
Atropia.....1-60 gr.	**Morphia, Sulphate** 1-16, 1-10, 1-8, 1-6, 1-4 gr.
Belladonna Extract.....1-4 gr.	**Morphia, Valerianate**..... 1-8 gr.
Calcium, Sulphide.....1-10 gr.	**Podophyllin**.....1-8, 1-4 gr.
Codeia.....1-16, 1-5 gr.	**Quinia**.....1-2, 1-4 gr.
Corrosive Sublimate....1-40, 1-30, 1-20 gr.	**Strychnia**.....1-60, 1-40, 1-30 gr.
Digitalia.....1-60 gr.	**Sulphur, Iodide**.....1-25, 1-10 gr.
This is prepared in our own laboratory and can be confidently relied upon.	**Tartar Emetic**.....1-100, 1-20, 1-4 gr.
Mercury, Bin-Iodide.....1-25, 1-16 gr.	**Zinc, Phosphide**.....1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

Quote MEDICAL RECORD.

BEDFORD (VA.) SPRING WATER AND MASS.

Standard Natural Remedies endorsed by Medical profession for Throat, Skin, Stomach, Blood and Uterine Diseases. Efficiency attested by results in thousands of cases during the last 25 years. Full proof, with analysis and directions, sent with each package. Prices: Water, $4.00 case; Mass. $1.00 package, or $10.00 a dozen. Liberal terms to the trade. Special rates to physicians. "Successfully used for Dyspepsia, Diarrhœa and Female Complaints."—Prof. Sam'l Jackson, M.D., Univ. of Penn. "Invaluable for Neuralgia and Nervous Diseases."—Geo. T. Howison, M.D., Women's Hospital, N.Y. "Unequaled for diseases peculiar to females."—John P. Mettener, M.D., LL.D., of Va. "Specific for Scrofulous and Cutaneous Affections."—J. M. Allen, M.D., of N. C. "Excellent Tonic Alterative and Diuretic—one of Nature's greatest remedies."—Medical Asso. of Va., Lynchburg. Address, **A. M. DAVIES, Prest. of the B. A. & I. S. Co., Lynchburg, Va.**

Sold by CASWELL & MASSEY, New York City.

CARNIER, LAMOUREUX & CIE.,

213 RUE ST. HONORÉ, PARIS,

Beg leave to inform the profession that Mr. F. ALFRED REICHARDT, 404 Fourth Avenue, N. Y., is their Sole Agent, and keeps a full stock of their Sugar-Coated Pills and other goods on hand.

Referring to above, I beg leave to call the attention of the profession to the goods made by Messrs G., L. & Co., of Paris. They are the first house which made Sugar-Coated Pills a specialty, and their goods were introduced twenty-five years ago into the United States. Their goods are superior in finish and quality to any other made. They use no coating between pill mass and sugar, and all their pill masses are easily soluble. **Their list prices to physicians are lower than other makers,** and their goods more reliable.

The latest additions to their list are: Dragees of Crystal: Valerianate of Ammonia, without taste or smell, 2 grains; Citrate of Codein, ½ grain; Monobromide of Camphor, 2½ grains; Codeia, 1-5 grain: Crotors Chloral (Liebreich's), 2½ grains; Cynoglosse or Pil. Nepenthe; Diascardium; Extract Eucalyptus, 2½ grains; Malate or Pomate of Iron; do., with ¼ grain Extr. Nux Vomica; Extr. Gilsemium: Drag-Meglin; Quin. and Ferri Citras, (20% Quins.) 2 grains; Tonic Aperient: also the already well-known Granil Proto-Iodide Mercury, 1-5 grain, and Dr. Francis' Triplex Pills.

Goods sent free by mail on receipt of list price. Please send for Price List and Descriptive Pamphlet, mailed free on application.

F. ALFRED REICHARDT, Pharmacist and Importer, 404 Fourth Avenue.

Original Lectures.

FRACTURES OF THE NECK OF THE FEMUR IN THE ADULT.

A CLINICAL LECTURE DELIVERED AT BELLEVUE HOSPITAL, DECEMBER, 1877.

By FRANK H. HAMILTON, M.D.

GENTLEMEN:—Before I speak on the special subject selected for to-day's clinic, I wish to say a word upon another matter. Since my last lecture I have received a note from a gentleman asking whether I had not done an injustice to Dr. Buck, in saying that he did not first suggest or practise elevation of the foot of the bed as a means of making counter-extension in fractures of the thigh. I shall not hesitate to mention the name of the gentleman who wrote me the note. I do not think he would object to my doing so, for, although a pupil of Dr. Buck's, and naturally jealous of his well-earned reputation, he is not only one of our best surgeons, but a liberal man, and he would be unwilling to sacrifice truth to friendship. The gentleman of whom I speak is Dr. Weir, of this city.

In an interview which I had with Dr. Weir subsequently, he stated that, while a pupil of Dr. Buck's, and one of the house-surgeons to the New York Hospital in 1859, Dr. Buck directed him to elevate the foot of the bed in the manner that we now do, and that he dressed a fracture of the thigh in this way; and this, he feels certain, was the first time Dr. Buck tried this method. I was then able to show Dr. Weir that I had published this method in 1857, in the third part of my "Report on Deformities after Fractures," at pp. 436–7 of the "Transactions of the American Medical Association" for that year, a description of the method being accompanied with three woodcut illustrations; and I speak there of the method as having been suggested by Dr. James L. Van Ingen, of Schenectady, N. Y. I was engaged several years in the preparation of the consecutive numbers of this report, and they were published in the Transactions for 1855, 1856, and 1857. My impression is, that these woodcuts were received from Dr. Van Ingen several years before they were published, but this is not material; they were published in 1857, and Dr. Buck made his first experiment in 1859, according to Dr. Weir.

It will be seen, if you look at the report alluded to, that the foot of the bed was placed at different heights in the three woodcuts, but in all of them it was higher than we now raise it; and the first time I ever tried the method I followed Dr. Van Ingen's practice, and found it very uncomfortable. It is worth your while to notice that Dr. Van Ingen calls attention to the necessity of keeping the pillow under the head, so as to "leave the neck and shoulders quite free;" that he places a pad under the knee, and under the leg above the heel, as I have recommended to you before—showing that he had practical experience in the matter. In one of his woodcuts the extension is made by a gaiter, and in another by adhesive strips.

NOTE:—I find that there are two other errors to be corrected in this connection, one or both of which I may, perhaps, have contributed to propagate.

First.—Dr. Buck was not the first to employ the pulley and weight as a means of extension. The earliest account of this method of which I have any knowledge is furnished by Dr. L. A. Dugas, of Augusta, Ga., and will be found in my report to the Amer. Med. Association, vol. x., pp. 434–5, for the year 1857 illustrated by two woodcuts. As will be seen, directions are there given for making extension by a weight and pulley—the rounded top of the foot-board serving as the pulley. Dr. Dugas used a loop of bandage instead of adhesive plaster, to take hold upon the foot and leg. "A two or three pound weight should then be fixed to the foot and hung over the foot-board of the bed, as indicated in the annexed figures, so as to keep up extension, while the resistance of the patient's body will effect counter-extension," etc., p. 434. The weight was much less than we now use, but the idea of a weight and pulley is clearly stated. Dr. D. had even thought of and practised making counter-extension by the weight of the patient's body, but he had not elevated the foot of the bed. The apparatus as thus constructed was far less perfect and efficient than that now employed.

Second.—I was not the first to suggest the long side-splint as I have once publicly stated, to make certain that the body and upper fragment of the broken thigh were kept in line with the lower fragment. It was suggested and practised by Dr. Dugas, as will be seen by a reference to the same report. He used it to keep the body in line, but not to prevent eversion. His apparatus was also shown in the first edition of my book on Fractures and Dislocations, p. 414, but it was dropped in subsequent editions, and Dr. Buck's substituted. Dr. Buck used the same round ball for extension as was used by Dugas, but he substituted a pulley for the round top of the bedstead.

I will add a paragraph from a letter written by Dr. Dugas, and sent to me by Dr. F. G. Smith, Secretary Amer. Med. Association, not heretofore published. Perhaps the profession may have very little interest in these questions of priority, but as the questions have been raised it seems proper to state the facts once for all:

"AUGUSTA, GA., June 27, 1857.

"DR. F. G. SMITH:—

"DEAR SIR—In compliance with the request of Dr. Frank H. Hamilton, of Buffalo, I now send you a couple of sketches, with a brief description of the method I have *long adopted* in treating fractures of the thigh."

Then follows a description of the apparatus, and an allusion to his well-known mode of diagnosticating dislocations of the shoulder, which I shall omit. It is my impression that the apparatus will be found in some of the earlier numbers of the *American Jour. of Med. Sciences*, but I have no time to look for it.

The "American method," then, as I have chosen to call it, is indebted especially to the following gentlemen for its present state of perfection.

In 1851, Dr. Josiah Crosby published his method of extension by adhesive strips.

In 1857, and probably many years before, Dr. L. A. Dugas recommended the weight and pulley (the round top of the bedstead), and suggested the weight of the body as a means of counter-extension, and the long splint to keep the fragments in line, which I also used many years before I published any account of my method.

In 1857, or earlier, Dr. James L. Van Ingen elevated the foot of the bed to increase the weight of the body as a means of counter-extension.

Dr. Buck substituted a pulley proper and an upright board to carry the rope. He did not use the long splint, and for a long time after 1859 he used and recommended a perineal band

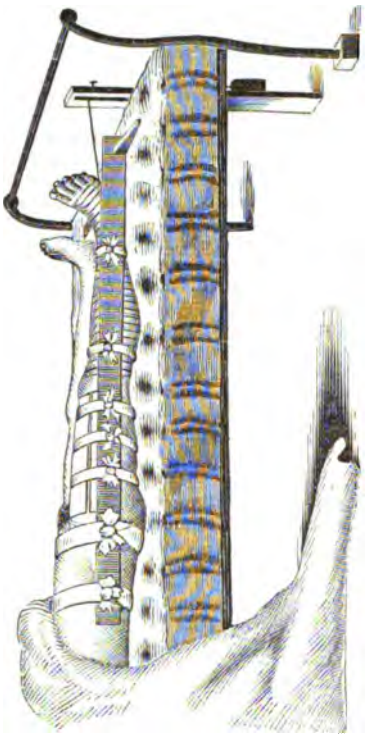
If I have contributed anything myself, it has been by the combination of the various improvements, by the addition of certain minor modifications, and by giving to the whole the test of extensive and comparative trial.

We will now consider *fractures of the neck of the femur*, of which we have several examples before us. I shall confine myself to these fractures as they occur in adult life. Fractures of the neck in early life are exceedingly rare, and the few cases which

have been recognized clinically have all left a doubt as to their exact character.

I do not propose to speak particularly of the pathology of these accidents, or of their causes or signs. I shall assume that you have studied all these matters. My present purpose is to speak only of the treatment.

It is necessary to say, however, that a fracture may occur within the capsule or without the capsule, and that the latter are almost always impacted, the neck being driven into the shaft, and being there more or less firmly fixed. We have these two kinds of fractures in old people mostly, and although they differ considerably as to their causes, their symptoms and



Dr. Hamilton's Dressing for Fracture of the Neck of the Femur.—*From General Treatise on Surgery.*

their results, the proper treatment in the two cases differs very little.

Let us see. If the fracture is within the capsule, it may not shorten at all at first; but inasmuch as in almost every such case, perhaps in every case, the neck will be in part or in whole absorbed, generally within a few days or weeks—for this process of absorption goes on very rapidly after the fracture has occurred, as I have proven by several observations upon the cadaver,—for this reason a shortening must soon occur, and in the end the upper end of the shaft will become attached by fibrous tissue, perhaps to the head of the bone, remaining in the socket, perhaps to the capsule and other parts about the joint—perhaps to both; and the shortening is apt to be very great, being probably greater in proportion as the upper end of the shaft and the portion of the neck attached to it is drawn farther from the head by the action of the great muscles of the thigh and hip. You see, therefore, that in this case it might be an object to hold the limb extended for a time with a weight and pulley, and thus to make the fibrous bond as short as possible; in other words, to secure for the limb as much length as possible. I do not speak of this as an ascertained fact, namely, that by permanent extension maintained for a few weeks, the limb, in case it has been broken within the capsule, will be in the end longer than if no such extension had been used. It is a theory only, which to me seems plausible, but which I have not proven. If, as some have thought, and perhaps some still think, a bony union is occasionally effected after this fracture, then certainly the extension would be useful for this purpose. I do not deny that such a thing has ever occurred, but I have never seen it, and I think its occurrence very improbable, even under the very unusual and the most favorable circumstance, namely, when the intracapsular fracture is at the same time an impacted fracture. I do not discuss that now. All I wish to say is, that my treatment would be proper in any view of the case.

There is another reason for extension in this case, if it can be employed. In my experience it has given the patient great comfort. It has arrested the contraction of the muscles and the constant motion of the fragments; and if the fragments are already displaced, this contraction and motion causes great pain by pricking and goading the inflamed capsule and the adjacent soft parts. The patient is easier the moment extension is applied. This is not speculative, but actually proven. I have observed it so often that no doubt remains in my mind as to its value in this point of view.

Let us consider now for a moment the *extracapsular*, impacted fracture; and these are almost always impacted.

These all unite readily by bone, and being impacted they unite very quickly. They are almost always found shortened from the very moment of the accident. Sometimes very little and sometimes a good deal—the shortening varying in different cases from one-quarter of an inch to one inch, possibly more or less in exceptional cases. This shortening has very little tendency to increase; but sometimes, if left to itself, it does increase quite perceptibly. The continued action of the muscles push the neck farther and farther into the broken, comminuted, and softened trochanter; softened after a few days by the inflammation.

At the same time and for the same reason that there is a tendency to shorten, there is also a tendency in the fragments to incline outwards laterally, and to cause a projection in that direction. In addition to all this the limb is apt to become everted, and this is partly owing to the action of certain muscles.

Now, with this brief explanation of certain peculiarities in these two forms of fracture of the neck of the femur, we will be able to understand what are the indications of treatment in each.

When speaking of fractures of the shaft of the femur in the adult, I said the first indication of treatment was to overcome the shortening caused by the contraction of the muscles, a shortening which we find present in these cases from the first. It is present immediately or very soon after the fracture has occurred, and it has to be overcome by energetic means. The second indication was to keep the fragments in line; and the third and least important, or least difficult to accomplish, was to prevent eversion.

When speaking in my next lecture of fractures of the shaft of the femur in children, I said the indications were in some sense reversed; the first or most difficult, being to keep the limb in line, and the second being to overcome the shortening in case any existed.

Now, in both of the forms of fractures under consideration to-day, the first indication is not to "overcome," but to prevent shortening, and incidentally to subdue or prevent pain; the second is to maintain

the fragments in line, and the third is to overcome or prevent eversion. The greatest difference is found in the fact that now shortening is inevitable, but we have the means of making it less than it would be if left to itself. At least in the case of the extracapsular fracture we can keep it where we find it, while in the case of the intracapsular fracture we can make the patient more comfortable and may hope to make the limb longer than it would otherwise be.

The treatment is then essentially the same as for a fracture of the shaft in the adult, except that instead of eighteen or twenty pounds we use eight or ten,—no coaptation splints are required—and the extension is seldom useful after about four weeks.

In the case of the patient before you, Catherine McCloud, the fracture is extracapsular. The patient is forty years old. She fell in the street, striking upon the left trochanter, and was on the same day brought to the hospital. Dr. Halsted, my chief house-surgeon, who is remarkably careful and accurate in his management of these cases, found the limb shortened and everted. The dressing was at once applied. Extension with a weight of eight pounds; the foot of the bed being slightly elevated, and the long side-splint being secured to the body and the left thigh. Now, at the end of four weeks, we permit this apparatus to be removed, and I find the limb shortened half an inch and slightly everted. The treatment is essentially completed, but she ought to remain in bed a week or two longer and then go about upon crutches.

The tendency to eversion in this case was marked from the first, and has not been overcome. My own long splint has failed to accomplish this; but Dr. Monroe, house-surgeon, has employed also in this case two pulleys instead of one, with the two lateral adhesive strips separated below the foot widely. This evidently has some effect in preventing eversion, but it has failed here. In addition to all this, there has been added an apparel devised by Volkman, a German surgeon, and described by Billroth; but you see this has failed equally. In short, you may learn from this that, in a certain number of cases of extracapsular fractures, and for reasons which I cannot now stop to explain, it will be found impossible to prevent eversion, but you ought always to try to make it as little as possible, and we think we have done so in this case.

The second example is in a woman much older, sixty-five years old. For your convenience in recording your notes I will give you her name also—Mary Stafford. She has been under treatment three weeks, and we find the limb shortened three-quarters of an inch, but with less eversion than in the preceding case.

Here is a third case; Pat Nugent, forty years old, fell thirteen feet, striking upon his trochanter, December 1, 1877. He was admitted on the same or following day, and was examined by me. The left leg was found shortened three-quarters of an inch, but he then informed us that this limb was always just three-quarters of an inch shorter than the other, and that his tailor always made this difference in the length of his pants. There being no eversion or other sign of fracture, I directed that no apparatus should be applied, but that the limb should be measured from time to time, and that he should be kept in bed. On the 10th day we found half an inch additional shortening, in all one and a quarter inches, and as this determined the question of fracture, extension was at once applied. The result is that we have prevented any further shortening. The limb being now one and a quarter inches shorter than the other, or one-half inch shorter than natural. There is now the characteristic enlargement about the trochanter, showing that it is an extracapsular fracture.

I cannot say positively that this limb was not some shortened at first, as I have nothing but his statements to rely upon; but it certainly shortened after he was admitted, and this is a new and important point. I believe, from my later experience, that this happens pretty often when extension is not employed.

My fourth case is of unusual interest, because the same fracture has occurred in both thighs at different periods of time, and the treatment and the results have been different. In all, I am able to present you then with five cases of extracapsular fracture. This last case is as follows:

Dennis Kelly, then seventy-two years old, was admitted to Bellevue in November, 1873, with an extracapsular fracture of the left leg. On the ninth or tenth day after admission, and after the fracture, the limb was done up in plaster-of-paris bandages, and soon after he walked about. The plaster remained on several weeks, being once renewed.

On the 30th of October last he fell upon the right side, breaking the neck of the femur on the right side, outside of the capsule, and was admitted at once to this hospital. On the following day Dr. Halsted applied my dressings, with eight pounds of extension. The man says: "From the moment the extension was applied I had no pain." This is the usual testimony. The apparatus was continued about five weeks, and we have now to note the results of the two fractures The left leg—treated with plaster-of-paris—is half an inch shorter than the right—treated by extension. The left trochanter and upper part of the left femur is bowed out, causing an ugly projection; the right trochanter and shaft have their natural form and position. In short, the left limb is in the same situation it would have been if nothing had been done, perhaps worse. In the right leg the result is certainly better. I am going to have the patient photographed.

Intracapsular Fracture.—Finally, I wish to show you, gentlemen, this old lady, Catharine Daly. She says she is seventy years old. This is an intracapsular fracture; the only intracapsular fracture out of six fractures of the neck which I have shown you to-day. In my Treatise on Fractures, fifth edition, I have spoken of the relative frequency of intra- and extracapsular fractures as still in dispute. In my experience, however, the extracapsular have been made the most frequent.

Observe now the points of difference. This patient is the oldest of them all, but none are younger than forty. The accident occurred, not from a fall on the trochanter, but from a slip of her foot while trying to drive flies from the room; there is no enlargement about the trochanter, although three or four months have elapsed since the accident; the limb is shortened one inch; and this is more than in either of the other cases; the toes are turned out strongly.

During the first three weeks she was under the care of Dr. Mott, and extension was employed by my apparatus with eight pounds. Since then she has been encouraged to get up and use her crutches, which she now does to some extent daily. While the extension was on she was very comfortable, but a long confinement would have made her bed-ridden, and it was removed as soon as the stage of inflammation was passed.

This completes my analysis of these cases. The result is in no case perfect, but we have reason to believe that all of those have been benefited, and their limbs rendered more useful, in whom moderate and continued extension has been employed for a period of from three to five weeks.

Original Communications.

DOSE-DISPENSING SIMPLIFIED.

AN EASY, ECONOMICAL, AND ACCURATE METHOD OF DISPENSING MEDICINES IN A COMPACT AND PALATABLE FORM.

By ROBERT M. FULLER, M.D.,

NEW YORK.

(A paper read before the New York Academy of Medicine, Feb. 21, 1878.)

MR. PRESIDENT AND FELLOWS OF THE ACADEMY:—The inability frequently experienced by physicians to obtain certain medicines, in separate doses, of a desired formula and mode of preparation, led me, some time ago, to undertake a series of pharmaceutical experiments with a view of contriving some simple, inexpensive and readily available method of preparing the medicines so desired.

After a number of varied and careful experiments, I succeeded in devising four methods of preparation, which, thinking that they might prove of interest as well as utility to the profession, I have ventured to present to you very briefly, and, I fear, somewhat imperfectly, this evening.

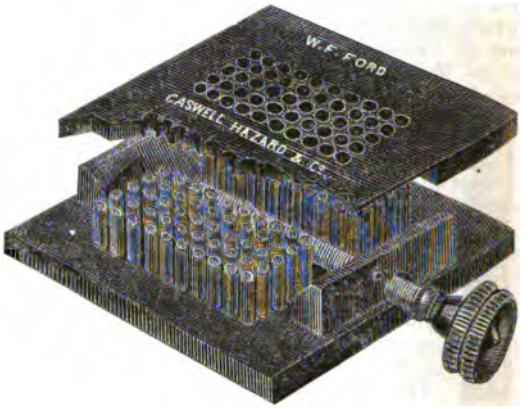
The preparations in question I have named *soluble tablets*, *tablet triturates*, and *pill* and *tablet saturates*, the former being designed for any powders which are to be administered in certain required doses, and the latter for certain of Squibb's fluid extracts, or other standard concentrated solutions. Of course, in the case of physicians practising in the city, where pharmacies are both so numerous and convenient, the application of these methods would be necessarily limited. They are mainly intended for physicians practising in the country, to whose use they are adapted by reason of their economy, dose-accuracy, compactness, and palatable form for dispensing.

The SOLUBLE TABLETS generally consist simply of certain medicines made into soluble paste with the aid of sugar of milk and alcohol, or water. In some instances, however, it is found necessary to employ an excipient more adhesive than sugar of milk. But in such cases, of course, as little of such excipient as possible should be used, in order that the tablet may be readily soluble in the mouth or stomach, or diffusible in a spoonful of water, and thus administered.

The tablets are intended to embrace any medicines that can be made into a paste which is not too tenacious, such as fluid extracts, or sugar of milk containing any per cent. of chemical, such as arsenious acid, sulphate of morphia, muriate of ammonia, etc. Both preparations can be made with alcohol of eighty-five per cent. or over, and pulverized acacia, according to the adhesiveness required.

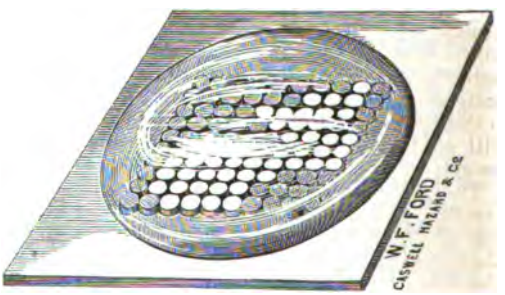
When fluid extracts are used, one minim or less may be mixed with a compound of two grains or less of sugar of milk and pulverized acacia, allowed to partially dry, and then be made into a paste with alcohol of eighty-five per cent.

The apparatus used in preparing the soluble tablets just described consists of a small bed-plate three-eighths of an inch in thickness, and five to seven inches square, made either of hard rubber or gold-plated metal, with a companion perforated plate, of similar dimensions, made adjustable and registering, and containing one hundred circular holes, more or less, as desired. The bed-plate is furnished with a number of small cylindrical projections, corresponding with, and fitting into the perforations of the upper plate. At each corner of the bed-plate is also fitted a short rod for the purpose of keeping the upper plate in position, and, at the same time, insuring its proper working. The upper plate is adjusted for the tablet mass, in accordance with the size of the tablet required, by a simple device of a screw, wedge, or lever. The paste, when of a proper consistency, is then introduced into the perforations of the upper plate by spreading it over its surface by means of a spatula. By the turning of the screw, or the removal of the wedge, the plate is next forced downward upon the projections of the bed-plate, which, in turn, force the tablets out in perfect shape. They are then removed and allowed to dry, after which they are used as has been described.



TABLET-MAKING APPARATUS.*

The TABLET SATURATES, which are similar to the pill saturates, to be described later on, are merely porous troches, or tablets designed for saturation. The difference between the tablets and the pills, beyond the difference in shape, being that the former will absorb a much larger quantity of fluid extract, or other standard concentrated solution, than the latter. The porous quality is secured generally by mixing *finely pulverized* sugar of milk with alcohol of eighty-five per cent., and then forming the paste into tablets of any desired size, and allowing them to dry. The tablets as thus made would be adapted for fluid extracts and certain solutions of great consistency, while a paste made of sugar of milk, mixed with water, would be found better suited for fluid extracts and certain solutions of less density.



METHOD OF TABLET SATURATION.

The method of medication consists of arranging any

* Mr. W. F. Ford, of Messrs. Caswell, Hazard & Co., has kindly furnished the above figure of the tablet-making apparatus, combining the screw and wedge principle, and also the wood-cut illustrating the method of tablet saturation.

number of tablets upon a glass plate, either together, in consecutive parallel rows, as shown in the accompanying wood-cut, or, in some instances, separated.

In the former case the fluid extract, or solution, is poured over the tablets, in the proportion of one minim to two grains, or a sufficient quantity for complete saturation, while in the latter a corresponding quantity of the solution is dropped upon each tablet by means of an improved minim dropping-tube. A funnel or glass may be loosely placed over them. They are then allowed to dry, after which they are ready for use.

MINIM PIPETTE.

The apparatus used in preparing the tablet saturates is similar to that used for making the soluble tablets. It consists of a similar bed-plate, provided with similar projections, and a perforated upper plate, the thickness and the diameter of the perforations of which are made with regard to the numb r of grains to be contained in the tablet desired.

The paste for the tablets is introduced into the perforations by spreading it with a spatula over the surface of the plate, while the latter rests on a square of glass. The under surface is then smoothed over, and the plate placed into position upon the corner rods of the bed-plate, and the apparatus operated as when making the soluble tablets.

The TABLET TRITURATES consist of triturations of metallic, mineral, and vegetable medicines, such as were mentioned in the paper recently read before the Academy by my friend Dr. Piffard, and found in the MEDICAL RECORD, vol. xii., p. 756. These preparations can be mixed with alcohol of any per cent., or water, according to the adhesiveness required, and the paste thus formed is then readily made into tablets of any size, with either of the above apparatus, as may be desired. They may also be made very inexpensively with a less elaborate apparatus, consisting of a single plate of hard rubber, containing two hundred holes of any dimension required, drilled as close together as possible. These being filled with the paste, the tablets, when not too tenacious, may readily be removed in proper shape by holding the plate in one hand, and with the other tapping it with a spatula, when most of them will fall out, those that may remain being easily removed by pushing them out with a small rod. Dr. Piffard has found that a plate three millimetres in thickness, containing holes six millimetres in diameter, will produce tablets of about one decigramme in weight, while a plate four millimetres in thickness, with holes eight millimetres in diameter, will produce tablets of about two decigrammes in weight.

The PILL SATURATES possess two favorable qualities, namely: they are made easily, and at an extremely low cost, those made with fluid extracts costing only about twenty-five cents per thousand. But little time is needed in their preparation, and the only apparatus required is a dispensing vial and a minim measure, or pipette. In the numerous experiments I have made, I have found that solutions in alcohol of eighty per cent., and aqueous solutions concentrated, were best adapted to the purpose of saturation. I have, however, used various other liquids and solvents with equally satisfactory results.

The process of saturation is very simple. Sufficient sugar globules of uniform size are introduced into a square dispensing vial of either four, eight, or sixteen ounce capacity, according to the number of pills designed to be saturated, to nearly cover one of its sides when it is placed in a horizontal position. I have found that No. 60 pill, which is six millimetres in diameter, is of suitable and convenient size for the purpose. [These globules, which are made of refined cane-sugar, are numbered as to their size upon a basis of measurement of *ten diameters* in millimetres.] The vial is inclined, and sufficient liquid—in which has been dissolved the required amount of medicine for each pill—is introduced by means of a minim pipette or measure, to completely saturate the globules. The vial is then held in a horizontal position and the pills agitated to equally moisten them, care being taken to avoid spreading the liquid on the other sides. While in this position, the vial is corked and allowed to rest until the pills are thoroughly saturated, which requires twenty-four hours or more. The vial remaining in the same position, the cork should be removed and the pills allowed to dry by evaporation.

MINIM MEASURE.

Where alcohol of eighty per cent. or more is the solvent, the solution to be introduced into the saturate can be of any strength. This principle applies also to the other solvents, such as ether, in which sugar is insoluble, and which will evaporate on standing. When water, or alcohol of less than eighty per cent., is the solvent, the solution should be concentrated to avoid the dissolution of the pills. The capacity of absorption possessed by the pills is varied, the maximum being one minim to about 15½ grains when the solvent is alcohol of eighty per cent. and over. The proportion, however, is not so large where concentrated aqueous solutions, or alcoholic solutions of less than eighty per cent. are used.

When these saturates contain volatile medicines, such as camphor, etc., it is expedient to give them a thin coating of albumen, or some similar transparent substance. While this prevents volatilization, it also enhances the appearance of the saturate. The method of coating, like the process of saturation, is also simple. The saturates are agitated in a little albumen, and, when covered, are placed on a glass plate, separated, and allowed to dry. A second or third coat may be given if necessary.

This constitutes the salient features of the four methods. They are given to the profession now at the personal solicitation of several of its members, and with full consciousness that there is still much room for improvement in them. They have at least a justification for their presentation at the present time, however, in the fact that, if applied to the field for which they are designed, they will be found practical.

The application of the principles is necessarily limited; but if, in the future, it shall have been found that its adoption by the profession resulted in the increased utility of a certain class of remedies, or the simplification of the method of administration, the purpose of the presentation of this paper will be more than fulfilled.

Thanking the members of the Academy for the honor and privilege conferred upon me in the granting of this hearing before them, and for their kind attention, I respectfully submit for their inspection a few preparations made by the method described:

TABLETS.

Acid. arseniosi	1-20, 1-50 and 1-100 gr.
Aconitiæ	1-50 "
Aconiti rad. ext. fl (Squibb's)	½ and 1 ♏.
" " tinct. "	½ and 1 "
Ammoniæ muriat	3 and 5 gr.
Antimon. et potass. tartrat	1-50 and 1-100 "
Atropiæ	1-60 "
Belladonnæ fol. ext. fl. (Squibb's)	1-2 and 1 ♏.
Calomel	½, 1 and 2 gr.
Digitalin	1-60 "
Ergotæ ext. fl. (Squibb's)	½ and 1 ♏.
Ferri lactat	1 gr.
Hydrarg. biniodidi	1-32 "
" chlor. corros	1-10 "
Ipecac. ext. fl (Squibb's)	½, ½ and 1 ♏.
Morphiæ sulphatis	1-8, 1-6, ¼ and ½ gr.
Nucis vomicæ ext. fl. (Squibb's)	½, ½ and 1 ♏.
" " tinct. "	1 "
Potass. bicarb	3 and 5 gr.
" chlorat	3 and 5 "
Quiniæ bisulphat	½, 1 and 2 "
Sodæ bicarb	3 and 5 "
Strychniæ	1-60 "

PILLS.

THE ANTECEDENT TREATMENT OF THOSE EXPOSED TO ZYMOTIC DISEASES.

BY E. M. HUNT, M.D.,

METUCHEN, N. J.

AN address before the American Medical Association (1877), and two articles on individual sanitation (MEDICAL RECORD, N. Y., Nos. 359, 370), have brought me letters from individuals—some of whom are personally unknown by me—sufficient to show that the subject is one eliciting much inquiry. I am asked to state definitely the theory of prevention, and the details as applicable in practice.

First of all, let it be understood that the proposal to prevent or abate zymotic diseases by antecedent medication is based upon two views:

I. That the contagium vivum is introduced into the human system from without, and mostly through inbreathed air. The proposition is so to surcharge the mouth and nostrils with substances inimical to the lodgment, propagation, or absorption of the contagium as to render the breath and the tissues more immediately exposed to inspiration unfriendly to the development of the contagium. When the floating infective particle presents itself, either for local manifestation or for absorption, it may take but slight unfriendliness of reception to prevent morbid result. I know not how little sulphur, or even lard alone, will prevent the egg deposit of the acarus scabiei or its incubation. The same is true as to the attachment of fungi, spores, etc. What we know as to both plants and animals shows how condition of surface, and even odors, determine choice of location, and the "instinct" of "infectants" shows choice and interruption not less wonderful than that which occurs in animal and vegetable (parasitic) life. In diseases such as diphtheria and scarlet fever, which have, at the start, such marked local manifestation as to lead to the hypothesis that they are local before they are constitutional, there is indication for special localization of protective methods besides the constitutional prevention or treatment.

In an article on diphtheria in your journal of Jan. 23, 1875, we therefore insisted upon the value of local medication, although aware of the disposition of some good authorities to ignore it. Local applications to the membrane and its edges, local ablution of the fauces to prevent the adherence or absorption of infected particles, avoidance of swallowing the spittle or secretion, and frequent rinsing of the mouth, were advised. Our design and method is not to leave the mucous membrane of the air-passages without the presence of the antiseptics. We even value the muriatis ferri chlorid. the more because of its corrugant or mechanical effect, as it thus disturbs the apposition of surfaces. In an article on scarlet fever in the RECORD, June 19, 1875, the same frequent cleansing of the throat, with a view to local effect, is insisted on. It somewhat surprises us to hear one of your recent contributors speak of his new method of frequent local medication.

Our second proposition is so to introduce substances into the blood, and through it into the body, as to prevent those fermentive, defibrinizing, or destructive processes which come to constitute the peril of these diseases. The article just alluded to sufficiently presents the method as adopted for early treatment. But we believe further that certain substances, thus introduced into the blood, and mingling with the secretions before the prodroma are manifested, are still more operative for prevention or limitation of the infective diseases. We thus not only protect the portals of entrance, but so infuse the fluids, glands, etc., as to have present in them an agent which will resist such morbid action as the disease toxic seeks to set up. How much may be due to the local hindrance to fertilization, and how much to the constitutional resistance established, may not, in each case, be easy to determine. But when we find how readily chlorate of potassium, after being administered, is found in the secretions, how soon a few grains of pure protochloride of iron increase by count the red globules of the blood, how defibrinization of the blood—so constant an occurrence in some of these diseases—is retarded by certain additions to the vital fluid, we are very hopeful that our power to suspend the action of disease poisons will be greatly augmented.

With quinine the experiment has been sufficiently sustained. It is taken—and taken successfully—as a prophylactic, by persons who have not had ague, but who are compelled to traverse miasmatic districts. The ratio of escape, and the value of such treatment to prevent recurrence, simply mean that somehow such resistance of the system is established as prevents the usual manifestation of morbid power. The miasm is inbreathed, but the receptivity of the system is suspended. We would experiment in the same direction in reference to all diseases the causes of which enter by atmospheric conveyance. The principle, too, is applicable to some of the diseases conveyed by imbibition. It will be a great gain if, in addition to seeking and finding the contagium vivum, or the conditions of its propagation by external nuisances, we can also exercise upon the individual prophylaxis, which means "*to defend beforehand.*" The doctrine of the incompatibility of certain substances with the development of zymotic diseases is quite in accord with views which have been entertained or illustrated by facts. The influence of the sulphites, as shown by Prof. Polli, of Milan, we have before noted. The interference of vaccination with the progress of whoop-

ing-cough has long been asserted by various reputable practitioners.

Dr. E. J. Syson, one of the English Medical Officers of Health, in a paper noticed in the *London Sanitary Record*, November 28, 1877, as of great importance, advocates the antagonistic treatment. He was led by some facts coming under his notice "to infer that it was impossible to vaccinate successfully a patient who was at the time under the medicinal influence of arsenic." In other words, it is possible to put the system in a condition temporarily unsusceptible to the "contagium vivum." He applied this mostly to the use of arsenic as an antiseptic in cases of actual attack. So important do the facts seem to the reviewer, that he says, if they are corroborated by other trials, the value of such treatment will be but little less than that of the discovery of vaccination. The paper of Prof. Hodgen, on Antiseptic Surgery (Int. Med. Congress, 1877), is worthy of reading in its bearing on antiseptic medicine. The third conclusion is, "It is possible that the living solids and liquids of the body may be so altered that they shall not furnish the conditions necessary to putrefaction." So, as to zymotic diseases, I believe we are yet to come to a recognition of our power by the use of medicines in advance to protect from prevalent epidemics. One class of agents may do it by the action of presence, another by chemical reaction; another by such antiseptic action as suspends excessive metamorphosis, or so deals with débris as to render it innocuous. Others, as is claimed for ammonia and liquor potassæ, retard the coagulation of fibrin. We are no longer confined to chemical antidotes, although these may operate upon disease toxics as well as others. Ergot and nitrate of amyl affect the calibre of blood-vessels, on a plan different from that of gallic acid.

Oxygen, electricity, ammonia, etc., are showing powers quite different from those of an alkali upon an acid. Just now we are not so much concerned about the theory of action as about the fact. The need is to accumulate evidence by those whose trials are exact in the details of method and in the record of results. We cannot at present be decisive as to all the agents which interfere with zymotic infections, or as to those which are especially adapted to each particular form. We need only now indicate those upon which we have relied, and the method of their use. The articles themselves are not new, but they are claimed to be preventives, to be used before any manifestation of disease in the individual. We shall here merely outline the method of individual sanitation adopted in diphtheria and scarlet fever as a specimen of the general course of management.

In the case of all children in the family beside the one attacked, give the skin a washing or wiping each day with lukewarm carbolic wash of the strength of Squibb's 2 per cent. disinfectant solution of the mixed phenols. As we have always inclined to the view of a localized planting or absorption, we use frequent local treatment. A gargle of chlorate of potassium three grains, tinct. chloridi ferri three drops, water three drachms, is to be used frequently in the mouth, and some of the same is used about the nostrils. Frequency at first is far more important than quantity. Employ both what is used as gargle and for administration every two hours in the day, and every two or three hours between 10 P.M and 6 A.M. We give internally every three hours the same amount as named above for a gargle, and every two hours if there has already been more than two days of exposure. After one or two days the chlorate of potassium and the iron can be detected in the secretions. So the buccal cavity and fauces have a share from this source, and the local use may be lessened one-half in frequency. The design is not to leave the mouth or the system without the indicated presence of these two articles, during what would be the prodromal stage of the disease. In diphtheral exposure we give in addition two grains of quinine twice each six hours apart. It is important to have the tinct. muriatis ferri of that made several months, and in its purest form, in which, and in which only, it contains the "sesquichloride of iron, muriatic acid, and alcohol, and from the reaction of the last two ingredients muriatic ether." "It is," says Wood, "possessed of peculiar properties, probably in some measure owing to the ether which it contains." In the preventive method for scarlet fever we do not use quinine. In addition to the diphtheral treatment we use Calvert's carbolic acid in a weak solution twice per day, and cleanse the teeth and mouth with a tooth-powder of equal parts of chlorate of potassium and powdered gum arabic. More attention is to be paid to a restriction of animal food with children who are full habited, and if the iron produces any constipation, as it generally does not, a mild cathartic is of service. Fuller particulars as to these or other diseases are not needed beyond those given in previous articles, and until more observations from others are accumulated. Reports either of failure or success need to be explicit as to the length of medication and the precise frequency, and the whole amount of preventive used; also as to the degree of severity in cases in which attack is not avoided. Our position as to the plan of prevention is not that of dogmatism, but only that of an impressed inquirer. Sir Thomas Watson has ably written on the abolition of zymotic diseases, from the standpoint of outside sanitation. There is internal sanitation as well. We do not fasten our faith to any one remedy, but believe there is a field of observation in the area of personal disinfection and antiseptic provision which may yet show us how to invalidate the title and so take possession as to dispute the occupancy of many an infective disease. It is not by large dosing or inadvertent medication, but by that intelligent supervision and timely contravention which make the ounce of prevention more potent than the pound expended for attempted cure—too often failing just because the vicious poison has already so affected fluids and functions and organs as to impede those processes which are not less indispensable for the physiological effect of medicines, than for that of all vital repair.

If "antiseptics may alter the tissues of a wounded surface so that, though septic matters are present, they may not be absorbed," and if living solids and liquids may be so altered that they shall not furnish the conditions necessary to the development of disease, we will not despair of "prohibiting," of "having beforehand" in the system unsusceptibility to the invaders, such as will not respond to their attempt at sovereignty.

LECTURES ON COOKERY TO MEDICAL STUDENTS.—Lectures upon sick-room cookery were recently given by Miss Dodds to the medical students of Edinburgh. As might have been expected, the attendance was large and the audience highly appreciative.

DR. FLEETWOOD CHURCHILL, the late distinguished professor of midwifery in the School of Physic in the University of Dublin, etc., died recently in County Tyrone. He will be recollected by the most of the older medical men as the author of a very popular treatise on midwifery.

Progress of Medical Science.

ENDOCARDITIS AS A COMPLICATION OF TYPHOID FEVER.—Endocarditis is a sufficiently rare complication of typhoid fever to render interesting the following case, observed on the service of M. Desnos, *Hôpital de la Pitié*. The patient was admitted to the hospital with typhoid fever, from which he was recovering when he suffered a relapse; while convalescing from this, undue exposure brought on a severe attack of bronchitis, accompanied by diarrhœa. This left the patient in a very reduced condition; and predisposed to the attack of phlegmasia alba dolens which shortly afterwards appeared in the left leg. Œdema of the other leg was soon observed at the same time, with marked dyspnœa, and auscultation revealed endocarditis, characterized by a double murmur at the base. As, during the progress of the disease, frequent and careful examinations had failed to reveal any affection of the heart, M. Desnos did not hesitate to consider this a recent attack dependent on the fever from which he had been suffering. Typhoid fever, like variola, and scarlatina, and some other fevers, may now be looked for in the previous history of those subjects of heart disease in whom the cardiac affection cannot be traced to some previous attack of rheumatism.—*Journal de Médecine*, December, 1877.

ENDOCARDITIS AS A COMPLICATION OF GONORRHŒA.—Gonorrhœa is so generally looked upon as a benign affection, that the possibility of such a complication as endocarditis is but rarely considered in the prognosis. In the following case, however, M. Desnos is confident that he had an endocarditis clearly traceable to gonorrhœal rheumatism. The patient was admitted to the hospital for acute bronchitis, and shortly afterwards was seized with persistent pains, accompanied by redness and swelling in the shoulder and in the sterno-clavicular articulation. Up to this time he had never suffered from articular rheumatism, but he was then suffering from gonorrhœa. A little later he was attacked by intense dyspnœa, accompanied by palpitation; the action of the heart became tumultuous and irregular, and it was soon easy to show all the signs of endocarditis, with mitral stenosis and insufficiency. Grave interference with the circulation occurred, and a general bronchitis supervened, which carried off the patient. The autopsy verified the diagnosis of endocarditis, which was found to extend as far as the aortic orifice. M. Desnos considered the endocarditis as evidently connected with the gonorrhœal rheumatism.

When presenting the pathological specimens obtained from this patient to the *Société médicale des hôpitaux*, M. Desnos remarked that endocarditis might complicate gonorrhœa under two circumstances: either no articulation is involved, the endocarditis appearing alone in the course of the disease; or, as is much rarer, it is developed simultaneously with the gonorrhœal rheumatism. M. Desnos has already observed a case of this. It is well to add also, that before the endocarditis had been manifested by the general symptoms, the heart had been carefully examined, on account of the persistence of the bronchitis, and had been found perfectly normal. There had been, besides, in the course of the rheumatism, two phenomena very characteristic of gonorrhœal rheumatism: first, the localization of the disease in the sterno-clavicular articulation, and second, the absence of profuse sweating, except perhaps towards the end, when it could be explained otherwise than by depending on the rheumatism.—*Journal de Médecine et de Chirurgie.* Dr. Marty has collected ten cases in which disease of the heart or pericardium has been developed within four or five weeks of the commencement of a gonorrhœa. (See MEDICAL RECORD, No. 353.) In eight of these cases gonorrhœal rheumatism had preceded the cardiac complication.

BALSAM OF GURJUN IN GONORRHŒA.—Balsam of gurjun, or wood-oil, is an abundant product of some of the resinous trees of India, resembling copaiba in appearance, and said by some to exceed it in its specific effects. M. Vidal was the first to experiment with it in France, and he looks upon it as being possessed of such remarkable properties, that it will rapidly come into general favor. In India it has been used with success in the treatment of leprosy; and, in one case of this disease under the care of M. Vidal, good results have followed its administration. It is in the treatment of gonorrhœa, however, that the most brilliant results have been obtained, the time of treatment varying in seventeen cases from ten to twenty days, it being shorter in those cases in which it was begun after the inflammatory stage had passed. M. Vidal uses the following formula:

℞.
Wood-oil,
Syrup.....āā 4 grammes.
Inf. aniseed..... 40 "

This draught was administered twice a day, at the beginning of meals. It is seldom necessary to exceed this dose, which is well tolerated, and of which the only effect on the intestinal track is the production of one or two stools within two hours after the meal; the maximum dose was eight grammes. At first, a certain amount of nausea is produced, but it passes off very rapidly. A quarter of a glass of wine administered after the potion renders it better tolerated. One of the advantages of the medicine is that there need be no change in the diet; wine was given during the whole treatment without producing any ill effects. Employed with the same care as copaiba, gurjun presents marked advantages. Its action is more rapid and certain, for it has frequently succeeded where copaiba has failed; it gives rise to no erythema; it gives no unpleasant odor to the breath or urine, which is one of the inconveniences of copaiba; locally, it succeeded well in vaginitis and balanitis; lastly, it costs less than copaiba.—*Journal de Médecine et de Chirurgie*, December, 1877.

UNEQUAL LENGTH OF LOWER LIMBS.—The equality in length of the opposite limbs has hitherto been but little questioned; but Dr. Jarvis Wight, of Brooklyn, made a series of sixty observations, which show that inequality of the lower limb is not only common, but the rule. Dr. Hamilton questioned the accuracy of these observations in one of his clinical lectures, and called forth in reply a paper read by Dr. Wight before the Kings County Medical Society. In this paper forty-two additional cases were recorded, giving results very similar to the first series. Some interesting measurements were given, which tended to show that differences existed both in the femora and the tibiæ, and also in the humeri, but no extended number of observations have as yet been made in this direction. Combining these two series of cases, Dr. Wight found inequality in more than three-quarters of the number, varying from one-eighth inch to one inch, averaging one-quarter inch. This explains the great variation in the amount of shortening occurring after fracture of

the femur, for, if the longer femur be broken, the "natural inequality" must be subtracted from the actual shortening; or, if the shorter femur be affected, the "natural inequality" must be added to the actual shortening to give the "accidental inequality" of the limbs. This would also explain those rare cases in which the fractured femur is longer than its fellow. The fact that these latter cases are not more common than they are, Dr. Wight explains in the following manner: The average shortening after fracture is probably not affected by the natural inequality, for the shorter limb is presumably broken as frequently as the longer; this average shortening he places at five-eighths inch, and, of course, the natural inequality must be greater than this to give lengthening to the fractured femur, and this great inequality is so exceptional that he estimates the changes of lengthening as one in two hundred cases. The article concludes with a letter just received from Dr. Hamilton, from which the following is an extract: "I have done you and science an injustice, and I make haste to repair the wrong. Yesterday I, for the first, found time to verify, by actual observation, the correctness of your statement and that of Dr. W. C. Cox, of Philadelphia, that the femora of most adults are unequal in length. In a dozen or more measurements, made with great care by my house-surgeon and by myself, a large majority were found of unequal length, and the left limb was generally the longest. I propose to extend my observations and to give them more precision, but I have made enough to satisfy me that you are correct." —*Proceedings of the Medical Society of the County of Kings.*

The Strong Elastic Bandage.—The treatment of varicose and other chronic ulcers of the leg is so generally unsatisfactory, that any new method promising favorable results is to be hailed with delight. The latest novelty is the use of the strong elastic bandage, with which Dr. Henry Martin claims to have cured over six hundred cases without a single failure. The bandage is of "pure rubber," ten and a half feet long, three inches wide, and thickness of number twenty-one "Stubs' wire gauge." The length and breadth may vary with the size of the limb, but this is the most desirable thickness. It is applied by winding one turn just above the malleoli, then one around the instep and sole, then spirally up the leg to the knee, where it is fastened by tapes attached to the end of the bandage for that purpose. If it is desirable to apply it as far as the groin, a bandage eighteen to twenty feet long will be necessary. At night the bandage is removed and the ulcer protected by a piece of oiled linen, or some equally simple dressing. In the morning all traces of oil or cerates must be carefully removed, as fatty matters tend to injure the rubber, and the bandage should be reapplied before leaving the bed. It should be applied with just sufficient snugness to prevent it slipping down, and the increase of blood in the veins on standing will cause it to become of the exact degree of tightness. The bandage keeps the leg warm, moist, and air-tight, conditions most favorable to granulation and cicatrization, and in addition the gentle, even pressure so supports the distended and weakened vascular coats as to prevent that venous congestion so frequently the cause of the malnutrition of skin. For the first one or two weeks a papular eruption appears under the bandage, caused by obstruction to the cutaneous follicles. The bandage is their best treatment. In non-specific ulcers no other local treatment is necessary. The circulation of the limb is not stopped, but, owing to the support given to the vessels, is facilitated; thus there need be no fear of causing œdema of the foot—on the contrary, the œdema which so constantly accompanies varicose ulcers is rapidly absorbed. The occurrence of œdema indicates the improper application of the bandage.

The use of this apparatus is not confined to the treatment of ulcers; injuries and diseases of the joints, especially of the knee and ankle, are equally benefited. In sprains, the strong elastic bandage wound around a joint affords a constantly present substitute, externally, for the disabled ligament. The constant pressure induces a rapid absorption of the exudation among the tissues about the seat of injury, and the gentle, equable warmth and moisture, which always accompany its application, have a most favorable effect in alleviating and preventing inflammation. In diseases of the joints marked by effusion, the application of the bandage after aspiration has been followed by complete success. In these cases the bandage should be applied day and night for six to eight weeks. Its use is also recommended in disease of bursæ mucosæ, œdema, erysipelas, and erythema, cutaneous affections, and as a radical cure for varicose veins; in the latter case it is supposed to act by causing adhesion of the walls of the vessels, and their consequent obliteration.

Carbolate of Soda in the Treatment of Nervous Affections of the Respiratory Passages.—Dr. Pernot, of Lyons, has employed the raw carbolate of soda extensively during the past year, and regards it, when properly used, as a very valuable remedy in the treatment of the above-mentioned affections. It has two principal actions, viz.: it is disinfectant and antiseptic, and it exerts a modifying and curative influence on bronchial affections, and particularly on pertussis, for which it is almost a specific. He calls it raw carbolate of soda, because, in addition to the soda and carbolic acid, it contains many of the constituents of tar. When coal tar is distilled at a temperature of from 170° to 220° C., a heavy oil is obtained which contains forty per cent of phenol. On treating this with a solution of caustic soda a heavy brown liquid is thrown down, which is the carbolate of soda along with certain impurities derived from the tar. According to Dr. Pernot, all nervous and spasmodic affections of the bronchi—asthma, catarrh, influenza, and simple colds at the outset—are markedly influenced by the vapor of this raw carbolate of soda. On whooping-cough its action is most striking. He has found from numerous observations that after from two to ten days of treatment the paroxysms of coughing become much less frequent, less prolonged, and less severe, the vomiting diminishes or ceases, and the respiration becomes easier. He has never seen the symptoms become worse after his treatment was begun. The treatment consists in volatilizing the liquid by means of heat in the sick-room two or three times a day. About 3 x. of the liquid are placed in a porcelain vessel and exposed to the flame of an alcohol lamp. It volatilizes almost completely. The patient is allowed to breathe a purer atmosphere for two or three hours between each sitting, but a saucer containing some of the liquid is constantly kept under the bed. Dr. Pernot reports a few cases of pertussis and one of asthma, which illustrate well the action of the remedy, and certainly seem to justify all that he claims for it. Where a porcelain cup and an alcohol lamp cannot be got, a heated fire-brick may be used to volatilize the drug.—*Lyon Médical*, Sept. 23, 1877.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, March 9, 1878.

COMMITMENT OF THE INSANE.

THE proper method of committing lunatics to the asylum is just now the subject of some discussion. The interest which apparently centred in the Dickey case—in which a lady was alleged to be confined in an asylum for years, and without cause—has extended itself so as to involve a question of special legal enactment. The very case in point proves, however, that there is very little, if any, danger of being committed to an asylum without cause. As we have before remarked, the patient was undoubtedly insane, and by the generality of medical men would have been deemed a proper object for asylum treatment. This part of the case seems to be clear enough, notwithstanding the testimony to the contrary of two of the medical experts. The physicians who constituted the original commission were perfectly competent to examine such cases; both were gentlemen of large experience, and one had special facilities for the study of cases of insanity by an experience of several years as medical officer in an asylum. Their diagnosis was confirmed by the medical officers in charge of the asylum to which the patient was sent, and the treatment adopted was in all respects justifiable and orthodox.

It happened, however, that the question of money was intimately associated with the freedom of this patient, and on that account the case became one of judicial inquiry.

The verdict, although scarcely warranted even by the skilful adaptation of the scientific facts brought out in the trial, was nevertheless quite a natural one under the circumstances. A great deal of mystification was thrown upon the question of insanity by the counsel, and the jury simply gave the plaintiff the benefit of the doubt, especially as an endeavor was made to prove that the members of her family had a pecuniary interest in the committal.

That the same routine is not gone through with other cases similar to the one in question, is perhaps so much better for them and for the State. We have no doubt that many such females are now in asylums, and are likely to remain there because they have no friends who may be pecuniarily interested in getting them out, or relatives who for the same motives are interested in keeping them there. But after all, is this a calamity? The very circumstances that a patient has sufficient money and plenty of friends to institute legal proceedings to obtain liberty, implies a capability for a careful guardianship afterwards. The latter was secured in this case. So far, then, as the money element is concerned, the evil corrects itself, and in a case where there was no money, the evil would not as such exist.

We might say, in passing, that the very appointment of a guardian so effectually stultifies the ruling of the court that the case, as a leading one, must certainly have a short life.

The real harm done in this case was the creation of distrust and alarm in the community concerning the methods of committing the insane, causing asylums to be looked upon as the veriest "mad-houses" of old times, and their medical officers as common jailers. Although the possibility of great wrongs in this direction may be allowed, their probability can hardly be entertained with sufficient seriousness to warrant any great concern, either from the people at large, the bench, or the legislature. The laws as they now stand are not perfect, but more is required in the direction of enforcing them than in creating new ones.

It is perfectly absurd to presume that there is no hope for a supposed lunatic when once under asylum influences. There are plenty of safeguards for such an unfortunate, be he rich or poor. The boards of inspection of our asylums, the States Charity Aid Association, and the Commissioner of Lunacy, all stand between the patient and the medical superintendent of any of the institutions for the insane. In regard to these privileges, the rich and the poor are on the same level. Cases of doubt do occasionally arise and are duly examined, but the rule is almost invariable that a decision is in favor of the asylum. Miss Dickey's case is a notable exception, but her discharge under the circumstances will hardly be an argument in favor of any change, except that which would necessitate the existence of a jury of experts for such trials. In fact, this is the only way in which a reform could be effected regarding the protection of persons committed to asylums. There would then be no chance of misunderstanding the true significance of the medical testimony offered on either side, and no reason to doubt the ability of the jury to draw just conclusions. If such a jury had tried the case in question there is but little doubt as to what the verdict would have been. Although the idea of a jury of experts is by no means new, it has recently gained in currency by the admirable paper of Dr. M. A. Pallen, on "Insanities in

Females."* He made the suggestion that such a court or jury of experts should be formed for the trial of all cases of insanity. Although the plan suggested is good, it is not practical. We cannot suppose that every case of insanity is a doubtful one and needs such inquiry; and if it did, how could time be obtained or opportunity gained to look after the multitude of cases in our asylums? The truth is, we must allow that but a very small proportion of these cases are at all doubtful, and still fewer would demand more than the ordinary safeguards which are now already thrown around them. This is a broad statement, it is true, but one which is amply borne out by experience of medical men in our asylums. The present bill before the legislature contemplates such a provision; but so far as it has an application to every insane person in an asylum, just so far will it be unpractical and defeat the real object for which it should become a law. Such reforms overreach themselves. Let us have a jury of experts, a lunacy commission, to pass judgment upon doubtful cases, but let their work be confined to such cases only. They will then not be overburdened, and all the requirements of ordinary justice will be met. The necessity for this jury is not only apparent in the case of Miss Dickey, but will be equally so in similar ones, the trial of which may be conducted in a like manner. The fact is, the jury under such circumstances cannot expect to obtain absolutely impartial expert testimony so long as such experts are retained by the respective parties in the suit. It is expecting too much of ordinary human nature to rule out the possibility of a mental bias in favor of the side represented. This may be expected of an ordinary witness, when it should never be entertained of an expert. Under the circumstances, the two situations are not convertible, or at least should not be.

THE CASE OF EX-SURGEON-GENERAL HAMMOND.

THE Committee on Military Affairs in Congress, to whom was referred the bill for the relief of Dr. William A. Hammond, late Surgeon-General of the Army, has made a favorable report thereon, and recommend its passage. This is a bill which provides that the President shall be authorized to review the proceedings of the court-martial convened by Special Order No. 24, War Department, A. G. O., Washington, D. C., January 16, 1864, and by which W. A. Hammond, then Surgeon-General of the Army, was tried, and to annul and set aside the finding and sentence of said court-martial, approved by the President, Aug. 18, 1864, if, after such review, the President shall deem it proper so to do. In the event of the latter, the bill further provides that the President shall be authorized to place Dr. Hammond's name on the retired list of the army as Surgeon-General without pay or allowances, past, present, or future.

The circumstances attending the trial of Dr. Hammond are still fresh in the minds of the profession of the country, and no detailed reference thereto is necessary. The impression at the time was, that the charges were made more for political than for other purposes, and the ability of substantiating them was very generally doubted. The very satisfactory manner in which the medical department of the army was managed, the many important reforms which were initiated by him, and their subsequent brilliant consummation, strengthened such an opinion. It was a matter then of general surprise that he should have been found guilty of the charges, and much more so that he should have received such a sentence. That such a view was fully justified, subsequent events now prove, for, after many years, when an appeal is made from the terrible verdict, the committee of Congress make this explicit and gratifying statement:

"A careful, unbiassed, and searching scrutiny of the evidence adduced upon the trial, as presented and reviewed by Dr. Hammond, as well as mature consideration of the argument of the distinguished counsel who represented Dr. Hammond on the occasion of his trial, forces irresistibly the conclusion that the gravamen of all the charges, save one, was either disproved by the defence, abandoned by the prosecution, or eliminated by the findings of the court. The single charge of which the gravamen was not found wanting by the court, was in itself trifling if not frivolous, and certainly insufficient in character and importance to arraign, try, convict, and pronounce sentence thereupon, in the manner and form as are in the records of the court-martial set forth."

The profession never believed that Dr. Hammond was guilty of corruption in office, or that he committed any offence which could have been considered, under the circumstances, as grave enough to merit his sentence. There were times when his authority overreached itself, when extraordinary measures had to be adopted, but these were generally justified by the exigencies of the situation. At the worst, however, they were errors of judgment which, although amenable to the strict letter of military discipline, were intended to be on the side of the sick and wounded soldier. Such an end would justify almost any means when backed by a conscientious appreciation of the responsibilities of the occasion. The profession has never been backward in giving credit to Dr. Hammond for such intentions, and in judging him accordingly. It is a matter of congratulation that the time has at length arrived when justice can be done him, and some amends can be made for the terrible disgrace under which he has so long suffered. The prompt passage of the bill, and its endorsement by the President, is the least that can be done to remedy a monstrous wrong to a man now proved to be innocent, and to correct one of the many blunders committed during the late war.

* Some Suggestions with Regard to the Insanities of Females, by Montrose A. Pallen, M.D. *Amer. Journ. Obstet.*, April, 1877.

MEDICAL CERTIFICATES IN THE DAILY PAPERS.

THE New York correspondents of some of the medical journals of the large cities here and abroad have devoted considerable space to the subject of medical certificates as connected with the advertisement of certain mineral waters. THE MEDICAL RECORD is very kindly mentioned as the means to the end of the withdrawal of the names in question. There is considerable difference of opinion as to the wisdom of the course which we pursued, and some exceptions taken to the arguments which we offered in favor of our position. Various reasons are also assigned for the stand taken, but none of the real ones are given. We are sorry so much misunderstanding exists upon the various points in this discussion, and take the opportunity of correcting it. We do not care to claim any particular credit for the result attained, and only mention it in connection with the RECORD as showing that, after all, we were on the right side and correctly interpreted professional opinion. We rebuked the practice of publishing or allowing these certificates to be published in the daily papers, claiming that it was undignified, unprofessional, and in direct violation of the spirit of the Code of Ethics. At first we stood alone; the County Medical Society was without the necessary machinery to carry on any work of reform, and there was no tribunal before which the matter could be legitimately brought. The New York Academy of Medicine waited for the County Society, and the latter waited for the Academy. In the meantime the advertising was going on, and many openly declared that the Code was virtually a dead letter, as there was no power to enforce it. Still, the RECORD kept up its protests, asked for the withdrawal of the names, and demanded, in the name of the profession, that a Committee of Ethics should be formed in the County Society, and that the whole matter of medical certificates should be brought before it. The formation of the committee followed, and then its report recommending the withdrawal of the names. In the meantime the gentlemen who had given the certificates took active measures in the matter, and their names disappeared from the advertisement. When the Committee on Ethics next reported through the Comitia, although the names were no longer attached to the advertisements in question, the practice was formally condemned, and the request made that the gentlemen whose names had appeared should officially notify the Committee of their withdrawal. The report was adopted at a full meeting and without a dissenting voice. Due notification of the withdrawal of the names has now been made, and thus the matter has ended. Now if, as some of the correspondents declare, this was all unnecessary, we were wrong from the beginning, the Society was wrong throughout the whole affair, and the gentlemen who wrote the certificates were wrong, not only in heeding the demands, but in acknowledging their error in an official manner. In any event, we do not believe that any respectable medical gentlemen can be found, in this city, at least, who would be willing to run the risk of writing medical certificates for publication in the daily papers.

THE CORONERS' BILL.

DR. ISAAC I. HAYES' bill, relating to coroners in this city, has passed the State Assembly and now awaits the action of the Senate. It provides that each coroner shall receive a salary of five thousand dollars per annum in lieu of all fees or compensation. Provision is made for *post-mortem* examinations. When an autopsy is to be made the coroner shall subpœna only one physician to make it. No jury shall be summoned unless the physician shall deem it necessary. The Board of Coroners shall, within five days after the passage of the Act, appoint four physicians, residents of New York, to be called upon for *post-mortem* examinations and medico-legal investigations. The Board of Estimate and Apportionment shall fix the pay of the physicians, but the pay of each shall not exceed three thousand dollars per annum.

In this shape the bill is shorn of most of its purely political elements, which is so much of a recommendation for it. At present the office of coroner is one the pay of which is out of all proportion to the services rendered, and it is time that some change should be made in cutting down the enormous fees.

The salary proposed in the new bill is quite reasonable, but is still sufficient to command the services of good men in all the departments. Each coroner is allowed two thousand dollars extra for office and clerk hire, which is more than sufficient to meet all his probable demands in those quarters; but this is one of those compromises with the evils of our political system which it is impossible to avoid on any work of reform. The amendment appropriating three thousand five hundred dollars for a general clerk is absolutely unnecessary, in fact, is a palpable attempt to create a sinecure for political purposes. But there is no doubt that this portion of the bill will be defeated in the Senate. On the whole, then, the bill is a good one, and is calculated to correct many of the gross abuses connected with the office of coroner.

PRIZE ESSAYS.

THE Prize Committee of the Alumni Association of the College of Physicians and Surgeons, in its present annual report, declined to award the prize to any of the competitors, giving as an excuse therefor, that neither one of the three essays presented was up to that standard of excellence it was the intention of the college to establish. The amount set apart for the purpose was two hundred dollars. From the foregoing facts it is safe to conclude either that the judgment of the Committee is at fault, or that there is not enough of inducement on the part of our best men

to write such essays as may be considered worthy of the reward. The former is by no means so probable as the latter.

There are many faults connected with the Prize Committee system which might explain this in a measure, but when the ground is taken that none of the theses come up to a given standard, there is a significance about the position which must not be lost sight of. That there is not a sufficient incentive on the part of the able men to compete for these prizes is quite evident, if for no other reason than that only three out of the large number of alumni of this college entered the lists. We think, then, that Dr. W. C. Livingston touched the key-note of reform and progress when he moved to increase the prize-fund so that an annual income of five hundred dollars might be secured as a reward for the successful competitor. We have no doubt that this will effect the object for which it is intended. Dr. Livingston very pertinently remarked that such a prize would stimulate the older men to work, men whose time was more valuable than that of fresh graduates, and who could give the results of their experience and researches rather than anticipate such by blind theorizing or useless and impracticable experimentation. Then again, the prize being a large one, and the competition being proportionably active, the honor of being the winner is correspondingly great, and independent even of the pecuniary consideration, will be calculated to stimulate first-class talent.

Reviews and Notices of Books.

A Treatise on the Pathology of the Urine. By J. L. W. Thudichum, M.D. 2d edition. Philadelphia: Lindsay & Blakiston. 1877.

It is nearly twenty years since the first edition of this work earned for its writer a distinguished position among the urinologists of the world. Of late years, though still holding an honored place, its usefulness has been supplemented by the more recent works of German and other English authors. This second edition, therefore, will be examined with interest by all who are interested in its subject-matter. Those familiar with the author's later labors, more especially the ones that have seen the light in the "Reports to the Medical Officer of the Privy Council," are fully aware of the industry and originality that characterize them. These qualities, then, we have a right to expect in the volume before us, and upon consulting its pages we are not disappointed.

After discussing the general characters of the urine, the author considers first its organic ingredients, as urea, kreatine, uric and other organic acids, coloring matters, etc., to the number of twenty or more. The inorganic acids next claim attention, followed by alkalies and alkaline earths, and iron. Then come the substances that appear as abnormal constituents of the urine in consequence of disease. Succeeding these are several chapters devoted to the consideration of various medicinal and other substances, which after ingestion appear in the urine, with methods for their detection and analysis. The whole concludes with a scheme for the systematic analysis of the urine and of urinary calculi.

While the work on the whole is a wonderful collection of useful information—in fact, the most complete in existence on the subject which it treats—there are certain omissions that impair its value to the practitioner. The most important of these is in connection with the quantitative determination of urea. Liebig's method is alone given. This method, when practised with the modifications and corrections rendered necessary under varied circumstances, is doubtless capable of yielding very correct results in the hands of a skilled chemist like the author; but for ordinary clinical purposes in the hands of a physician, the method, when practised with ordinary precaution, is troublesome, and too often deceptive and unreliable. The more convenient gaso-volumetric and gaso-gravimetric methods devised of late years yield much more accurate results in ordinary hands. The author's *penchant* for the invention of new terms and long words has been fully indulged, though not to the extent met with in some of his other writings.

The microscopical features of the urine receive scanty attention.

Reports of Societies.

NEW YORK STATE MEDICAL SOCIETY.

Adjourned Meeting, held in Albany, January 15, 16, 17, 1878.

Vice-President, Dr. A. L. Saunders, in the Chair.

LACERATION OF THE CERVIX UTERI AS A FACTOR IN CERTAIN UTERINE DISEASES.

Dr. Walter B. Chase, of Windham, Greene Co., read a paper upon the above subject and reported illustrative cases. The position taken by Dr. Chase was, substantially, that laceration of the cervix uteri occurred rather frequently; that it was a condition quite frequently overlooked; and that it was a condition which, when complicating displacement of the uterus, would not recover spontaneously. Operative procedure, therefore, became a necessity.

The paper gave rise to discussion, which was participated in by Drs. Fordyce Barker, H. T. Hanks, and A. Jacobi, as follows:

Dr. Fordyce Barker, of New York.—Mr. President: I think there can be no doubt that the paper first read by Dr. Emmet, of New York, upon lacerations of the cervix uteri associated with the puerperal state, is one of the most important contributions which has been made to gynecology.

I remember well, when I heard the paper read before the Medical Society of the County of New York, that I listened to it with great interest, and I must say, also, with great surprise. The characteristic pathological phenomena attending this condition I recognized clearly and distinctly, but having seen it in only a few cases, I was surprised because of the enormous number of cases which Dr. Emmet reported as having himself seen.

Soon after I read some statistics given by Dr. H. T. Hanks, of New York, of cases which he had seen in the Demilt Dispensary. Again I was not able to explain, satisfactorily to my own mind, why this gentleman should have seen such a large number of cases, infi-

nitely larger than I had seen in all my life, and that I should have seen so few cases in a similar class of practice.

I subsequently saw a patient with Dr. Emmet, and in that case he demonstrated the accuracy of his description of this class of cases. The patient had a large cervix uteri, one which measured two and a half inches in diameter. It was evidently everted, and the uterus measured between five and six inches in depth.

In pushing up the uterus, or rather pushing up the everted cervix, the size of the cervix diminished fully one-half.

Subsequently, Dr. Emmet operated upon this cervix in the manner he had described, and I was again given the opportunity to measure, and found that the uterus had diminished in depth to about two inches and seven-tenths.

Now, this was a complete demonstration of the accuracy of his description and the correctness of his pathological view.

It then remained to me to account to myself for the fact that I had seen so few cases.

For several years I have been constantly watching for such cases, and in that period of time I have seen, as cases which have first come under my own observation, only two. What is the explanation of this fact? I will give the explanation which I believe is true, and which I think has an important practical bearing.

My experience has been confined mostly to treating women who have had excellent obstetrical attendants during confinement; who have been in good circumstances in life, and had everything at their command which could favor complete restoration from the puerperal period. This has been my experience, with the exception of twenty-three years' service in Bellevue Hospital, where, of course, I attended obstetrically a large number of poor persons, who left the hospital after the puerperal period had passed, and who, having good attendance and rest in the hospital, complete involution was generally secured.

The question, then, arises, does subinvolution prevent cicatrization of the laceration, or is the laceration the primary condition and that which prevents involution of the uterus?

My own conviction is, that it is a pathological condition almost never found in patients who have proper obstetrical attendance, or who have been in circumstances in life which permitted them to secure proper hygienic and medical treatment to effect proper involution of the organ.

This view explains why it is that Dr. Emmet, who sees patients coming from all parts of the United States, most of whom had no medical attendance during the puerperal period, and also why it is that Dr. Hanks, who sees these cases in the Dispensary, say that they are of very frequent occurrence. It may be said in answer to this, that when the laceration is closed by the operation, involution is completed and the uterus restored to its normal size.

I accept that; but I do not consider that it in any way invalidates my theory. That laceration of the cervix takes place very frequently in parturition, I am sure every obstetrician will agree. I believe it is also true that the laceration heals spontaneously in a large proportion of cases, and I think that the appearance of cervix uteri of women who have borne children, in the most of whom cicatricial evidences of former lacerations are found, is a perfect demonstration of the truthfulness of this position.

In a vast majority of cases they get well without an operation. But there is a class of patients who are surrounded by such circumstances as will not permit such spontaneous recovery to take place; they are poor, and their circumstances compel them to rise from their confinements too early; and in a few others, who are not poor and have good medical attendance during the puerperal period, they suffer from pelvic irritation of various kinds, such as pelvic peritonitis, pelvic cellulitis, etc., etc. The effect of all these influences is to prevent union of the lacerated surfaces.

The experience of Dr. Emmet is, that these lacerations are found much more frequent upon the left than upon the right side of the cervix.

The explanation for that is, that left occipito positions occur much more frequently than right; in the proportion of about seven out of ten times the vertex presents.

It occasionally happens that a double laceration is produced, and this may result from some peculiar condition affecting the process of parturition.

Now while I fully agree that a certain class of these cases should be treated, I am compelled to take a position somewhat at issue with the author of the paper when he expresses the opinion that these cases never get well without the performance of a surgical operation.

I believe that some of them may get well without such procedure.

Formerly, that is, before Dr. Emmet read his paper, I used to see cases which were supposed to be granular inflammation, ulceration, or abrasion of the cervix, with enlargement of the uterus, and my experience was, and so it was of a great many others I am sure, that after the application of local treatment to the cervix the size of the uterus was diminished, the appearance of ulceration disappeared, the leucorrhœa stopped, the pelvic pains were relieved, and for a time at least the patient was cured. But in a few weeks some of these patients would return, and upon examination they would be found to be just as bad as ever. In some cases, however, I did succeed in effecting a cure—a complete involution of the organ and restoration of the ulcerated tissue—by placing the woman in a recumbent posture for two or three weeks and making occasional applications of the actual cautery.

Now, the fact that some such cases as these can be cured without a surgical operation is important, because the operation always requires confinement of the patient, and some of them will not consent at all to it. In such cases my method of treatment would be as follows:

In the first place I require the patients to keep the recumbent posture, to use vaginal injections of hot water twice a day, using a gallon or two of water at a temperature of 100°, 101°, 102°, or 103° F., according as they can bear, and besides, put them upon constitutional treatment, by way of the use of the tincture of the chloride of iron, Squibb's fluid extract of ergot, and nux vomica, to promote involution.

The object is to so improve the general condition of the patient as to effect contraction of the muscular fibres of the uterus and restore the deficiency of nerve-force to the patient.

In the course of three or four weeks the uterus—for I now am speaking of a particular case—was reduced in depth from four and three-quarter inches to three and one-eighth inches. The patient was then permitted to be up and about, at the same time wearing a cotton tampon dipped in a saturated solution of tannic acid in water.

I may remark in passing, that I think it is a mistake very frequently committed, to make for this purpose a solution of tannin in glycerine. For glycerine pro-

duces a discharge from the mucous membrane which counteracts entirely the action of the tannin.

From day to day, as I introduced the tampon, I was able to see its size regularly diminished, and after a time the woman was able to dispense with it entirely. This patient has not required treatment since.

Of course, in the class of subjects in which we meet with this affection most frequently, where the disease has resulted from inability on the part of the patient to secure competent obstetrical treatment, or to take proper care of herself during the puerperal period, we have this measure suggested by Dr. Emmet.

I think in these cases it is also important to obtain a complete understanding of the history of the patient.

In the cases which have been published, as yet, there has been no report upon the puerperal condition of the patient during the time when this pathological condition was developed. Such history is very important, and is necessary to establish the truth or prove the error of those conditions I have suggested.

In conclusion, I would simply say that the truth is, that a condition which prevents involution during the puerperal period also prevents cicatrization of lacerated tissues; that the same cause of the lacerated tissues contributes to prevent subsequently any cure of those phenomena due to increased weight of the uterus, and such as reflex pelvic pains, leucorrhœa, displacement from increased weight, and failure of normal support.

I would not say that laceration causes subinvolution, nor that subinvolution prevents the healing of the laceration; but that both are the result of a common cause.

I would ask gentlemen who may meet with these cases to obtain, as fully as possible, the history of the patient during her puerperal period, and my strong conviction is, that it will be found that there is some inflammation of the pelvic organs that prevented involution, or some improper hygienic influence, and that, therefore, the two conditions are a common result of this cause, and do not bear the relation to each other of cause and effect.

Dr H. T. Hanks, of New York.—Mr. President: I am interested in the paper that has just been read by Dr. Chase, for two reasons: First, because the author of the paper is known to me as a careful observer and a judicious operator. Second, the lesion of which he treats is one which has engaged my attention very constantly for the past five years; having observed a large number of cases, and frequently operated, and as frequently witnessed operations for the same by Drs. Emmet, Peaslee, Thomas, and Lusk.

The general practitioner of to-day does not fully realize, and fails to trace back to their true cause, the serious results which follow as a necessary consequence this accident. As Dr. Barker has remarked, it is but a few years since Dr. Emmet first called the attention of the profession in New York City to the pathological condition and treatment of the lesion.

Those who have listened to or read the two papers which Dr. Emmet has written upon the subject, willingly accord to him the honor of first describing this condition, and suggesting an operation for its relief, since which time hundreds of sufferers from laceration of the cervix in New York City have been relieved. Without doubt the operation has been performed sometimes unnecessarily by some gynecologists, as there are those who would readily account in their own minds for all the evils that flesh is heir to, by a slight laceration of the cervix uteri. It is equally certain that the necessity for an operation is often overlooked by the general practitioner.

Respecting the frequency of the lesion to which Dr. Barker has referred, the statistics which I gave at the time of Dr. Emmet's first paper, were confirmed at the time of his second paper by the statistics of Dr. Mundé, furnished from another and similar charitable institution.

There are three palpable reasons for the greater frequency of this accident among the poorer classes than among those in good circumstances. The first reason will be apparent when I state that I know three physicians in New York City who attend between three and four hundred cases of labor in a year. These must necessarily hasten the labor or apply forceps before complete dilatation has taken place, and, of course, often to the detriment of the mother.

2d. The sexual relations of the poorer classes are not so cleanly nor so healthy as prevail among intelligent and well-to-do people. An erosion or abrasion of the cervix previous to pregnancy may be allowed to go on until full term, at which time the cervix is not elastic nor normal, but congested, friable, and easily lacerated. Again, a woman may have gonorrhœa during pregnancy, and in such case I do not believe that it is possible for her to have a child without producing more or less laceration of the cervix.

3d. Among those in good circumstances, the patient is usually kept in bed for a fortnight after a hard labor; good nursing is the rule, not the exception; vaginal injections are frequently resorted to; and involution will take place quite satisfactorily, even though there had been a slight laceration. On the other hand, among the poorer classes, from necessity or ignorance, the patient is usually out of bed by the third or fifth day, whether the labor has been easy or difficult—long before involution can have been accomplished or any restoration of the laceration can have begun.

But this condition is still found among those whom we would suppose should have had the best care and attention, and is the cause of much pain and distress which can be accounted for by no other reason.

It was only this week that a lady, who had been attended by an excellent accoucheur, consulted me for profus emenorrhagia, exhausting leucorrhœa, and long-continued distressing backache. I found, on examination, the uterus prolapsed to second degree, measuring three and a half inches, and sharply retroflexed; a bilateral laceration of the cervix to the vaginal junction, with hypertrophied, red, eroded, and everted edges.

These symptoms had been present since the birth of the last child, one year previous. The only satisfactory explanation of this pathological condition of the uterus is, that the laceration took place at the birth of the last child; proper involution did not follow; the uterus remained heavy; the ligaments continued relaxed, and the fundus fell backward and downward.

The menorrhagia resulted from the congested and increased surface of the mucous membrane; the leucorrhœa from the congested, eroded, and lacerated cervix; the backache from the stretched ligaments.

I believe it is our duty to study for the prevention of this laceration as much as its treatment. We cannot be too judicious in refusing to hasten labor before the cervix is dilated.

When unavoidable laceration, to our knowledge, has taken place, we can avert many serious results by keeping the patient in a prone position for a portion of the time. Frequent vaginal injections of carbolized warm water should be used. The patient should be

kept in the horizontal position for from two to four weeks, or until involution has fully taken place.

DR. A. JACOBI, of New York.—I believe I am one of those who are expected to have nothing to say upon this special subject, because I am but one of the general practitioners who have assembled here. We are, most of us here, general practitioners, and the important question is to be decided whether every case of lacerated cervix, as the paper under discussion appears to indicate, should go into the hands of specialists? It is as a general practitioner that I mean to say a few words. Now, my friend Dr. Hanks has said "I believe" a number of times during his short speech. I shall try not to use those words a single time. Imagine, for instance, that you have to deal with some kind of wound, say an open wound in the angle of the mouth—what will become of that wound? If it is kept clean, it will heal in a brief space of time. But imagine that you have to deal with such a wound in the mouth of a tobacco-chewer, or in the mouth of a diphtheritic patient, or in a child suffering from stomatitis—what will become of it? Within two or three days we shall see an ugly-looking sore; there will be swelling in consequence of increased cell-growth and exudation from the blood-vessels; as a result of absorption by the lymph-vessels, there will be swelling of the cheek and the neighboring glands, and the wound does not heal. It may cicatrize spontaneously within from two to six months, and when it has closed a large portion of the swelling of the cheek will, it is true, disappear, a large amount of the glandular swelling will subside, but a certain portion may never disappear.

This is the case, because we know that in the course of time the hypertrophy of the glands and the newly formed connective tissue will not be reabsorbed.

When we cut through such an enlarged gland, we find that it is simply a mass of indurated connective tissue that will remain permanent.

This condition has been developed because the wound was not kept clean from the beginning; it had no chance to heal.

Every such wound or erosion will follow the same course, because it is governed by the same physiological and pathological laws. Almost every woman who bears children has one laceration of the cervix uteri. Most of these lacerations heal, and the uterus is again perfectly healthy.

But, imagine that the woman does not keep the vagina and cervix clean when in the puerperal condition; the discharge from the uterus and vagina will keep such a laceration from healing.

When it does heal, if it does, it is an innocent affair, unless the wound has extended into the peritoneum.

If it does not heal, why not? It does not heal so long as there is the slightest external irritation. When it does not heal, the result is swelling of the parts adjacent; there is metritis; also enlarged uterus and parametritis in a great many cases, and it is for the same reason that there is glandular and connective-tissue enlargement in the neighborhood of the ear when there is an unhealed fissure at the angle of the mouth.

What can an operation for cure of the laceration do in such cases? It will remove the ulcerated surface; that is good. It will heal the lacerated cervix; that is good. But if the uterus is increased in size in consequence of the erosion or ulceration, and a great deal of new connective tissue is formed, the glands suppressed and compressed, and uterine catarrh once established, neither the uterine enlargement nor the uterine catarrh will ever get well, no matter whether the laceration is closed or not, unless they are treated and cured separately. It is true that an always new source of inflammation, and an always new source of catarrh is suppressed; and Dr. Emmet, who has first proposed and performed the operation for lacerated cervix, a good observer and successful operator, never appeared to me to obtain more than that.

If the woman keeps the vagina and uterus clean after confinement by having two, three, or four daily injections of simple warm water applied until the lochial discharges cease, it is probable that every laceration, unless it enters the peritoneum, will heal; in the presence of blood and pus it will not heal.

Take, as a further illustration, a common nasal catarrh, which lasts eight to fourteen days and then gets well. But imagine that there are other exposures and new irritation of the surface. In that case, the nasal catarrh may never get well, because new connective tissue is formed, the little glands in the mucous membrane and the membrane itself become swollen, and their enlargement is permanent. If recovery is to take place in nasal catarrh, absolute cleanliness must be maintained.

These little glandular enlargements will never be removed unless the nasal passages are cleansed three, four, five, six times a day with injections of water, and this procedure is kept up for three or four weeks for the purpose of absolute cleanliness. I have not seen chronic nasal catarrh get well under the influence of any merely medicinal applications, or operative proceedings, least of all with strong applications of nitrate of silver; but I have seen it get well by the use of the very mildest applications, and by securing permanent cleanliness, and nothing else.

May not something else be done with regard to the laceration besides the bloody operation, which is very apt to fail at the hands of the inexperienced? For I have operated once for lacerated cervix uteri, and I feel that it may satisfy the exclusive gynecologists to learn that my operation was a failure.

I have not operated since, but I know I have cured a number of this class of cases.

My experience coincides with that given by Dr. Barker in regard to general treatment. The actual cautery I have used a great deal in the treatment of these cases when there is considerable swelling and thickening of the tissues. It will not only destroy the cicatricial surface, but enliven, on general principles, the adjoining circulation, and thus gradually restore the wound. Perhaps I may be permitted to state in this connection, that I was the first to introduce the galvano-caustic into the cavity of the uterus; it was some ten or twelve years ago, and for the purpose of destroying the constantly bleeding remains of a placenta.

Thus I claim, that if anything can be done for the results of laceration of the uterus, the actual cautery will probably do as much as will the bloody operation. When this is performed very late, I claim that under ordinary circumstances the uterus will remain as large as it is before the operation is performed, and that the actual cautery will have a better success, as far as the removal of secondary enlargement is concerned; for it is the principal object of treatment to remove the source of the irritation and to favorably influence the nutrition of the neighboring parts.

This latter result can be obtained in those cases also where there is uterine catarrh with "metritis" or subinvolution, although there be no laceration of the cervix. Many cases where it is present will not be re-

lieved by the bloody operation. Many, where it is and where it is not, will be relieved by the actual cautery.

Excuse me, Mr. President, for consuming so much time; but I thought I would make these remarks, believing as I do that the condition referred to should be treated upon general principles, just as anything else should be.

Every general practitioner should be a sufficient physiologist and pathologist not to take for granted any results without scrutinizing them; and fortunately there are many means to accomplish the same object under different circumstances, as there are "many roads that lead to Rome."

NEW YORK MEDICAL JOURNAL ASSOCIATION.

Stated Meeting, Feb. 15, 1878.

DR. MATTHEW D. MANN, PRESIDENT PRO TEM., IN THE CHAIR.

ON THE USE OF HOT MUSTARD-BATHS IN PNEUMONIA IN CHILDREN.

DR. LEONARD WEBER read a paper upon the above subject, in which, after referring to several forms of treatment that had been recommended, he presented the claims of the hot mustard-bath in the treatment of pneumonia occurring in children. He first learned of that therapeutical agent in 1869. The history of several cases was related in which the disease had occurred in children from four to six months of age; they were regarded as cases of capillary bronchitis and pneumonia; the symptoms were extremely urgent. For instance, in one case the respirations were 72, the pulse 150, and the temperature 103° F., together with marked cyanosis and great restlessness. The baths were used after all other remedies had failed to afford any relief, and the child made a good recovery.

THEORY REGARDING THEIR MODE OF ACTION.

There were two agents in the baths, both of which acted upon the surface:

1. The mustard, which was an irritant to the skin; and,

2. The hot water, which dilated the cutaneous capillaries, thus assisting to increase the quantity of blood thrown to the surface of the body.

The increased blood-supply to the surface relieved in a great measure the congested pulmonary circulation and the overloaded heart.

The baths stimulated the nervous system and also favored the interchange of gases in the blood through the skin.

ADVANTAGES CLAIMED FOR THE BATH.

It was easily prepared; the materials could be readily procured; its action was prompt; there was no danger in applying it.

METHOD OF PREPARING AND USING THE BATH.

The bath was prepared by adding half a pound or a pound of ground mustard to a baby-tub of water, having a temperature ranging from 100° to 105° F. The child was placed in the bath, and, while there, the surface was to be thoroughly rubbed until the skin began to look red, usually from seven to ten minutes, then taken out, wiped dry, and put into a bed previously warmed. No ill effects had been seen by allowing the genitals to remain unprotected. The bath might be repeated as often as every three hours.

In conclusion, Dr. Weber questioned whether the antiphlogistic treatment of pneumonia by the use of cold baths, cold packs, etc., was a method that could be followed with advantage in this country.

DR. WILLIAMS remarked that he had seen fifteen cases of pneumonia treated by means of cold baths and packs, with the administration of whiskey before and after the bath, and the use of a full amount of nourishment. There were only two recoveries, and those patients doubtless would have recovered without any special treatment.

DR. MANN reported a case in which he thought the life of the child was nearly sacrificed by the use of the cold pack. The child was five years of age, and the temperature was most pleasantly and satisfactorily reduced by the use of ten-grain doses of salicylic acid.

DR. WEIR had had some experience in the use of cold affusions in the treatment of pneumonia occurring in children, but the results were very unfavorable; most of the children so treated died.

DR. HUBBARD spoke very favorably of the use of carbonate of ammonia in the treatment of pneumonia. His method of administration was in accordance with a suggestion made by Dr. H. P. Farnham—namely, as an effervescing mixture with citric acid.

A vote of thanks was extended to Dr. Weber for his paper, and the Association adjourned.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from Feb. 24, 1877, *to March* 2, 1878.

ALEXANDER, C. T., Major and Surgeon. Relieved from duty in Dept. of the Columbia, to proceed to St. Louis, Missouri, and report thence by letter to the Surgeon-General. S. O. 38, A. G. O., February 21, 1878.

NEW YORK COLLEGE OF VETERINARY SURGEONS.—The first annual commencement of this college, under the new régime, took place at Trenor Hall, on the evening of March 2d. After the conferring the degree of D.V.S. upon the graduates, the valedictory was pronounced by Mr. Walton, when Prof. Hammond was introduced, and delivered an address upon "Equine Psychology"—freely translated as horse sense. He commenced by observing that the horse was distinguished among domestic animals for docility and penetrating intelligence. Besides the fact that the equine brain was remarkable for the depth and number of its convolutions, its weight as compared

with the body was comparatively superior. The proportion of brain to body in the horse was 1 to 580; in the ox, 1 to 805. He regarded the horse as the most intelligent of the solipeds, and related numerous anecdotes illustrative of this view, drawing the conclusion that the intelligence of the animal differed only in degree (not in kind) from that of man. Passing to the interesting question of language, he observed that the nightingale produced forty different articulate sounds, and that there was no rational doubt that animals were able to convey very specific ideas to each other by means of sounds. He concluded with some remarks to the graduating class.

THE LATE DR. E. R. PEASLEE.—At a meeting of the New York Pathological Society, the following preamble and resolutions were adopted:

Whereas, It has pleased our Heavenly Father to remove from us by death our distinguished associate, Edmund R. Peaslee, M.D., LL.D., we would hereby express our sincere grief for the loss which we have been called upon to bear, and also record our profound esteem and admiration for his noble deeds and Christian character; and we hereby

Resolve, That in the life, labors, and character of Dr. Peaslee we have a commendable example of industry, usefulness, and Christian manliness, seldom combined in a single life.

Resolved, In the death of Dr. Peaslee the medical profession and society in general have sustained an unusual loss.

Resolved, That we tender to the family of Dr. Peaslee our sincere sympathy in their irreparable loss.

Resolved, That the above be published in the medical journals of this city, and also that a copy be sent to the family of the deceased.

JOHN H. HINTON,
JAMES L. BANKS,
CHAS. K. BRIDDON,
Committee.

ALUMNI ASSOCIATION, COLLEGE OF PHYSICIANS AND SURGEONS.—The committee appointed to nominate officers for the ensuing year made the following report: For President, Dr. William H. Draper, of New York; for Vice-President, Dr. Alexander N. Dougherty, of Newark, N. J.; for Secretary, Dr. Charles Hitchcock, of New York; for Assistant Secretary, Dr. J. N. Bertram, of New York. The report was adopted, and the officers elected. The Board of Councillors, fifty-seven in number, stands the same as last year, with but few exceptions. After the adoption of a vote of thanks to Dr. Bayles, the retiring Secretary, the meeting adjourned. The annual dinner took place at Delmonico's, Wednesday evening, March 6th.

MEDICAL SOCIETY OF THE COUNTY OF NEW YORK.—At a stated meeting, held Feb. 25, 1878, Dr. J. C. Davis read a paper on "Abscess of the Liver." It was maintained that heat did not necessarily indicate the occurrence of abscess of the liver, but that it depended rather upon dryness and moisture, customs of the people, non-observance of hygienic laws, etc. Abscess of the liver was divided into two varieties: 1. That brought about by inflammation of high grade, associated with tropical dyscrasia. 2. That due to thrombosis and embolism. Ulcerations in the intestines were regarded as one of the prominent causes. Theoretically, the explorative puncture was dangerous, but practically, it was not. Treatment by use of the trocar was advocated. Dr. Judson's field of observation had been in Mexico.

"The School of Salernum" was the title of a paper read by Dr. H. E. Handerson. It was an historical sketch of the rise, progress, and fall of that institution of learning.

DR. A. JACOBI brought before the Society the subject of making a *Catalogue of the National Medical Library*, and introduced a resolution making provisions for the appointment of a committee of twenty-five, which should urge upon Congress the propriety of making an appropriation for that purpose.

DR. O'SULLIVAN reported that the Committee on Ethics had been officially notified that all the members of the Society who had given certificates regarding the value of certain mineral waters had withdrawn their names from such recommendations.

UNIVERSITY OF UPSALA.—The King of Sweden has made the University of Upsala a donation of 40,000 crowns, the yearly revenue from which is to be distributed as premiums to young authors of scientific works.

BELLEVUE HOSPITAL MEDICAL COLLEGE.—The Seventeenth Annual Commencement of this institution was held at the Academy of Music, Thursday, February 28th, at 3 o'clock. The degree of Doctor of Medicine was conferred upon one hundred and thirty graduates.

Lieut.-Gov. Dorsheimer addressed the graduates. He remarked that there was but little reason for the selection of such a speaker to a class of young physicians, except that men in his position were called upon to speak on all subjects at all times. Lawyers, he said, did most of the public speaking nowadays. In former times, among the primitive men, one man exercised the offices of physician, clergyman, and lawyer. Afterwards they separated, the priest first, and, finally, the lawyer. If this order was in accordance with the Darwinian theory, it suggested a process of evolution to which further reference at that time might be considered discourteous. [Laughter.] He thought that modern science began with Bacon—a lawyer. For, although Columbus, Galileo, and, indeed, all discoverers, had worked upon the Baconian method, it was he that first announced the law, first showed that it was immutable, and applicable to all departments of thought and inquiry. The Baconian law might be familiarly stated to be this: Study the facts, and go to the conclusion which the facts establish. This simple axiom had changed the whole method of scientific investigation, and had become the rule of what was known as the experimental system of philosophy. He drew a picture of the state of Europe in the days of Bacon, and said: "Dreary superstition brooded over all—over the Church, the Court-house, and the sick-room. In medicine it was held by some that the blood alone gave warmth to the body; by others that it was a humor and the nursery of disease, and the universal nostrum was to get rid of the foul fluid by bleeding the patient. The king's evil was cured by the touch of a royal hand. The epileptics were bewitched, and the insane possessed of the devil. The duration of life was predicted by the stars. Whooping-cough was cured by persuading a dog to eat a hair of the child, and hydrophobia was cured by making the child eat a hair of the dog. There is no department of science which has taken more benefit from Bacon's teaching than yours. Medical science may be said to have begun then. The first application of Bacon's teaching was made by an English physician, William Harvey, who, eight years after the publication of the *Novum Organum*, printed a treatise demonstrating the circulation of the blood. This treatise is an example of the Baconian methods. Bacon himself

could not have demonstrated a fact in physics more strictly in accordance with his own methods." The speaker alluded to the discoveries of vaccination and anæsthetics, and asserted that there was a close bond of sympathy between the medical and legal professions. In conclusion he said: "I have held up to you great examples, not because I think that each of you should seek to equal them. But it ennobles the humblest man, however obscure his life may be, to think that where he walks others have found greatness. There lies before every one of you a work which will demand all the skill and wisdom you can acquire, all the courage and charity with which the lessons of the past can inspire you. You will often need to compose prescriptions more subtle than those you send to the apothecary: to 'minister to minds diseased;' speak the last counsel to ears already dull. Sometimes it will fall to you to gather up and weave together the ties of family, by passion or the treacherous hand of slander torn asunder, and often at the bedside of the dying to bind up the wounds of the living. Within the sacred realm of sorrow you will be what they were in the olden time—physician, lawyer, and priest. At the threshold of your career we all salute you with the wish that you may prove equal to its great demands."

The valedictory was delivered by Lewis C. Wagner, M.D., of the graduating class.

THE AMERICAN VETERINARY COLLEGE.—The annual commencement of the American Veterinary College was held on Thursday evening in the lecture-room of the College of Physicians and Surgeons, Fourth Avenue and Twenty-third Street. Seated behind the railing were the Faculty and Trustees of the institution, together with a number of distinguished medical men, among them Prof. John C. Dalton, who made the address of the evening, and Prof. J. W. S. Arnold, of the Medical Department of the University of the City of New York. S. Marsh, President of the Board of Trustees, presided. From the report of the collegiate year 1877–8 it appears the college is in a prosperous condition, and that it has been decided to extend the course of instruction necessary to graduation, so as to secure three years of study instead of two, as heretofore. The degree of D.V.S. (Doctor of Veterinary Surgery) was conferred by the President of the board, on behalf of his colleagues, upon the six members of the graduating class, to wit: John Frost, Winchester, Mass.; Alfred H. Rose, of New York; John H. Schmidt, New Jersey; Samuel E. Field, New York; John C. Force, New Jersey; and William H. Wray, New York. The prize for proficiency—a handsome case of surgical instruments—was awarded to John Frost. Prof. Dalton was then introduced, and read a short address on the responsibilities of the veterinary surgeon, the important contributions to physiology made by veterinary colleges, and the best methods of practice, concluding with an anecdote in ridicule of the routine doctor. Prof. J. W. S. Arnold followed with a written address of considerable length, in which he pointed out the facilities for investigation open to veterinary practitioners.

COMMENCEMENT OF THE COLLEGE OF PHYSICIANS AND SURGEONS.—The seventy-first annual Commencement of the College of Physicians and Surgeons, and Medical Department of Columbia College, was held at Steinway Hall, Friday evening, March 1st. Nearly every seat in the body of the hall was filled, and the galleries and boxes were fairly crowded. Prof. Alonzo Clark, President of the college, conferred the degree of Doctor of Medicine upon one hundred and nine graduates. He then delivered his address to the graduates. It was filled with the practical and advisory maxims that govern every successful professional career. Among other things he advised the graduates to cultivate a public spirit, and to be active in all measures of sanitary and other reform, but to avoid politics and to deny themselves to all offers of political emolument.

The award of prizes, by Prof. Markoe, followed directly upon the address to the graduates. The first award was that of the diplomas of examination honors to the ten members of the class who, in their examination before the Faculty for the degree of Doctor of Medicine and in their graduating theses, had shown the highest proficiency. Each recipient of such a diploma is entitled to appear at a special public competitive examination in writing for the three examination prizes. The following members of the class came forward as their names were called, and received their special diplomas: John S. Aitkin, Talbot R. Chambers, Edward Fridenberg, Richard J. Hall, Ellsworth Elliott Hunt, Alexis M. Low, Edward G. Manpin, William D. McKim, Charles D. Sarder, Isaac Weil. The first examination prize of $100 for general proficiency was awarded to Richard John Hall, the second of $50 to Isaac Weil. The third prize of $25 was awarded to two candidates, Edward Fridenberg and Ellsworth Elliott Hunt. The Committee of the Alumni prize of $500 for the ablest thesis, and that of the Joseph Mather Smith prize, announced that none of the theses offered had been of sufficient merit to justify an award. Charles D. Scudder delivered the valedictory, and Charlton T. Lewis, Esq., addressed the graduates.

UNIFORM MEDICAL EXAMINATIONS.—A bill is before the House of Commons, Great Britain, for providing a uniform test for admission into the medical profession in England, Scotland, and Ireland.

ELECTRICITY IN THE OPERATING-ROOM.—At Guy's Hospital both surgeries and the operating theatre are now connected direct with the electrifying room, so that the surgeon may have the current at his disposal at any time when he may require it. He presses a small stud, which rings a bell in the electrician's room, and points out on an indicator where the current is required. The latter is then turned on without loss of time. At night the operator can obtain the current by the simple movement of a spring, the indicating apparatus in the battery-room registering the fact, and also betraying the negligence of the operator if the current is not turned "off" when not required. The arrangements are complete, and work satisfactorily, and Mr. Seymour contemplates carrying them out in the medical wards, so as to avoid the necessity for shifting heavy batteries to that part of the hospital where the current is required.—*Dublin Press and Circ.*

TRICHINOUS DISEASE has made its appearance in South Bend, Indiana. Three cases have died and fifteen others with the disease are not expected to live.

THE CALIFORNIA STATE MEDICAL SOCIETY.—The annual meeting will be held at San José, Wednesday, April 17th.

HOMŒOPATHIC SYMPTOMS.—The encyclopædia of Pure Materia Medica (Homœopathic) gives a list of 3,115 symptoms produced by lycopodium.

THE LATE DR. WILLIAM STOKES.—The number of *The British Medical Journal* for February 2d contains an excellent portrait of the late Professor Stokes, of Dublin.

THE OVERCROWDED PROFESSION.—In the "Sentimental Journey," Lawrence Sterne says: "They order these things better in France." The following advertisement from a recent number of *Le Progrès Médical*, offers a striking contrast between the state of the medical profession in France and here: "VACANCE MÉDICALE. —La Commune d'Anville (Popula. 1270 h.) demande un médecin. Elle offre beau logement gratuit pendent quatre ans. S'adresser, etc."

Here is a community which probably numbers 5,000 souls (1,270 men), advertising for a doctor, and willing to furnish him good lodgings four years gratuitously. In this country the same number of souls is supplied with fifteen or twenty medical men. The above requires no comment.

ANTISEPTIC VINEGAR.—The following is the formula for the antiseptic vinegar prepared by M. Pennés, of Paris:

Salicylic acid	300 grms.	(℥ xss.)
Acetate of alumina	300 "	(℥ xss.)
Concentrated alcoholic solution of eucalyptus globulus	1,000 "	(Oij.)
" " " vervain	2,000 "	(Oxvitj.)
" " " lavender	1,000 "	(Oij.)
" " " benzoin	100 "	(℥ iijss.)
Acetic acid at 8° (Cent.)	1,000 "	(Oij.)

Mix carefully, shake often during two or three days, and filter to preserve.

This vinegar may be used as a lotion, either pure or diluted with water. Five quarts injected into the carotid has preserved a corpse perfectly for several months. As a disinfecting and antiseptic agent it may be employed in the form of spray.—*Le Mouvement Médical*, Sept. 15, 1877.

CHILDREN'S HOSPITAL OF THE DISTRICT OF COLUMBIA.—The seventh annual report of the Children's Hospital of the District of Columbia shows 122 admissions for the year 1877, which, with the 35 patients who were in the hospital at the beginning of the fiscal year, December 1, 1876, gives an aggregate of 157. Of these, 83 were discharged cured, 20 improved, 2 unimproved, and 18 died, leaving 34 inmates at the opening of the fiscal year current. Of the admissions, 73 were white and 49 colored; 68 male and 54 female. The number of dispensary patients during the year has been 766, of whom 379 were white and 387 colored; 367 male and 399 female. The daily cost per capita of the patients occupying beds in the hospital during the year has been only 58 cents, certainly a most complimentary exhibit for the management, and one which is commended to the consideration of boards of pauper hospitals in all parts of the country. The number of operations performed during the year has been 48.

BALTIMORE MEDICAL AND SURGICAL SOCIETY.—The following officers were elected at the Seventh Anniversary Meeting of the Baltimore Medical and Surgical Society: President, Dr. Wm. J. McDowell; 1st Vice-President, Dr. A. Friedenwald; 2d Vice-President, Dr. J. J. Caldwell; Recording Secretary, Dr. George H. Rohé; Corresponding Secretary, Dr. B. F. Leonard; Reporting Secretary, Dr. G. Lawson Wilkins; Treasurer, Dr. Wilmer Brinton.

THE MINUTE STRUCTURE OF RED BLOOD-CORPUSCLES.—In the November and December number of the London *Microscopical Journal* is an article on the above subject, being a notice of an article by Professor Boettcher, and published in the *Archiv für Mic. Anat.*, Bd. 14. Prof. Boettcher claims to have demonstrated the presence of a nucleus in said corpuscle. His method of work is as follows: "He makes use of a saturated solution of corrosive sublimate in 96 p. c. alcohol, and into about 50 volumes of this solution one of blood is to be rapidly diffused. By this means the corpuscles are deprived of their hæmatine, and their internal structure made clear. At the same time they are preserved and bleached. The mixture is frequently agitated, and in about twenty-four hours the corpuscles are allowed to subside and the superincumbent fluid poured off, and pure alcohol added. By frequent agitation for another twenty-four hours, the corpuscles are thoroughly washed. The alcohol is then poured off and clear water added. In a short time the corpuscles will be seen, as a nearly white layer, at the bottom of the vessel. By straining these with different fluids, Prof. Boettcher claims to be able to find three classes of red corpuscles. First, homogeneous and shiny throughout. Second, added to a homogeneous, shiny cortical layer is a granular mass in the interior, which takes the straining fluid readily. The third has the same cortical layer and protoplasm, but enclosed in the latter is a nucleus and nucleolus."

At the "Physiological Laboratory," University of Michigan, Dr. C. H. Stowell has demonstrated this structure in the manner given above. The specimens were shown to his classes in histology and to different members of the Faculty. Carmine was employed as the staining fluid.

The majority of the corpuscles were "homogeneous and shiny throughout," while some had enclosed within them a sharply defined nucleus, it being very rare to find one possessing a nucleolus also. There was a marked difference between the appearance presented by a corpuscle with a nucleus, and by the refraction of a "cup-shaped" corpuscle. By establishing a current through the field, the one appearance could not be mistaken for the other.

POPULATION OF BRITISH INDIA.—The territory subject to the British administration in India comprises 909,834 square miles, with a population of 191,065,445 inhabitants. The native states comprise 573,052 square miles, with 48,233,978 inhabitants. Including the French and Portuguese possessions, the entire superficial area of India is 1,484,150 square miles, with a population of 239,978,595 inhabitants. The 191 millions of inhabitants in British India are divided as follows among the different religious sects: Hindoos, 131,343,820; Sikhs, 1,174,436; Mohammedans, 40,867,125; Buddhists, 2,832,851; Christians, 897,682; others, 5,417,304; and 552,227 whose religion is not known.

NEW YORK EAR DISPENSARY.—During the past year there have been treated at this institution eight hundred and seventy-four cases of ear disease, a marked increase over that of any preceding year. The charity is well managed, and deserves its prosperity. Dr. Samuel Sexton is the surgeon in charge.

TRACHEOTOMY IN FRANCE.—In the Hospital St. Eugenie, of Paris, 2,312 operations of tracheotomy were performed during twenty-two years, with 509 recoveries. In the hospital for sick children, in Paris, 2,351 patients were operated upon in twenty-five years, with 614 recoveries. In all the hospitals of France, collectively, the average recoveries are 30 per cent.

TREATMENT OF BURNS.—The local application of a saturated solution of bicarbonate of soda in the treatment of burns is steadily growing in favor.

CHEAP MEDICAL SERVICES.—The British physicians are complaining against the growing custom of cheapening medical advice.

NOW READY.—Nos. 1 & 2.

STUDIES IN PATHOLOGICAL ANATOMY.

By FRANCIS DELAFIELD, M.D.

Adjunct Professor of Pathology and Practice of Medicine in the College of Physicians and Surgeons; Visiting Physician and Pathologist of the Roosevelt Hospital; Visiting Physician and Curator of Bellevue Hospital.

IN ROYAL OCTAVO PARTS,

Each containing from two to four full-page Lithographic Plates in tint, and in color, with accompanying explanatory text.

☞ These studies will form, when completed, a treatise on Pathological Anatomy of exceptional value, especially for the remarkable fidelity of the illustrations, their minute and elaborate detail. The Parts will be published regularly, the first of each month, and sent to subscribers carefully rolled to protect the Plates from injury.

No. 2 contained—THE PLEURA.

PLATE IV. Pleura of the Dog; magnified 750 diameters.

PLATE V. Endothelium and Branching Connective Tissue Cells from the Pleura of a Dog; magnified 1,500 diameters.

PLATE VI. Endothelium of Human Pleura; magnified 90 diameters.

PLATE VII. Lymphatics of the Parietal Pleura of the Dog; magnified 90 diameters.

PLATE VIII. Lymphatic Spaces and Connective Tissue Cells from the Pleura of a Dog; magnified 750 diameters.

Subscription Price, $5.00 a Year. *Single Numbers, 50 Cents.*

INVARIABLY IN ADVANCE.

☞ SPECIMEN COPIES WILL BE SENT ON RECEIPT OF 50 CENTS.

Address the Publishers,

WM. WOOD & CO., 27 Great Jones Street, New York.

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachms
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its present sale exceeds $100,000 per year at wholesale. Its almost universal adoption by the profession, as the above figures show, is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK's preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proven itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

PURE COD-LIVER OIL.

Manufactured on the Sea-Shore by HAZARD & CASWELL, from Fresh and Selected Livers.

The universal demand for Cod-Liver Oil that can be depended upon as strictly pure and scientifically prepared having been long felt by the Medical Profession, we were induced to undertake its manufacture at the Fishing-Stations, where the fish are brought to land every few hours, and the Livers, consequently, are in great perfection.

This Oil is manufactured by us on the sea-shore, with the greatest care, from fresh healthy Livers of the Cod only, without the aid of any chemicals, by the simplest possible process and lowest temperature by which the Oil can be separated from the cells of the Livers. It is nearly devoid of color, odor, and flavor—having a bland, fish-like, and, to most persons, not unpleasant taste. It is so sweet and pure that it can be retained by the stomach when other kinds fail, and patients soon become fond of it.

The secret of making good Cod-Liver Oil lies in the proper application of the proper degree of heat—too much or too little will seriously injure the quality. Great attention to cleanliness is absolutely necessary to produce sweet Cod-Liver Oil. The rancid Oil found in the market is the make of manufacturers who are careless about these matters.

Prof. PARKER, of New York, says: "I have tried almost every other manufacturer's Oil, and give yours the decided preference."

Prof. HAYS, State Assayer of Massachusetts, after a full analysis of it, says: "It is the best for foreign or domestic use."

After years of experimenting, the Medical Profession of Europe and America, who have studied the effects of different Cod-Liver Oils have unanimously decided the light straw-colored Cod-Liver Oil to be far superior to any of the brown Oils.

COD-LIVER OIL, with IODINE, PHOSPHORUS, and BROMINE.—This combination represents Phosphorus, Bromine, Iodine, and Cod-Liver Oil in a state of permanent combination, containing in each pint: Iodine, eight grains; Bromine, one grain; Phosphorus, one grain; Cod-Liver Oil, one pint.

COD-LIVER OIL, with PHOSPHATE OF LIME.—This is an agreeable emulsion, holding three grains Phosphate of Lime in each tablespoonful.

COD-LIVER OIL, with LACTO-PHOSPHATE OF LIME.

IODO-FERRATED COD-LIVER OIL.—This combination holds sixteen grains Iodide of Iron to the ounce of our pure Cod-Liver Oil.

JUNIPER TAR SOAP.—Highly recommended by the celebrated ERASMUS WILSON, and has been found very serviceable in chronic eczema and diseases of the skin generally. It is invaluable for chapped hands and roughness of the skin caused by change of temperature. It is manufactured by ourselves from the purest materials, and is extensively and successfully prescribed by the most eminent physicians.

FLUID EXTRACT COCA.

NERVINE, STIMULANT. USED IN PERU and BOLIVA as a MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This Wine has been successfully used in France as a **tonic,** and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

SOLUTION FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less Styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial, we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

RELIABLE ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*
This Animal Vaccine can be obtained at CASWELL, HAZARD & Co's., Broadway, cor. 24th Street.

FRANK P. FOSTER, M.D.

We have an arrangement with Dr. Foster by which we receive this Vaccine ***fresh daily.***
By this arrangement all supplied by us ***is absolutely fresh.***
We can furnish it in any quantity desired, either by express, or by mail, if remittance is made to cover postage.
Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified indorsement of the medical profession of New York

QUILL SLIPS (half quill, charged on convex surface, at square-cut end),	$0.25

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

The Spheroidal or Capsule shape of McKesson & Robbins' Pills is the best adapted to the throat, and obviates the sickening sensation so universal in swallowing a round Pill.

McKESSON & ROBBINS'

PILLS AND GRANULES,

OF THE

U. S. PHARMACOPIA & OTHER RELIABLE FORMULÆ,

GELATINE-COATED,

Process and Machinery Patented,

91 & 93 Fulton, 80, 82 & 84 Ann Sts., N. Y.

NEW THERAPEUTICAL NOTES.

CHARCOAL, WILLOW, ... 5 grs.

The value of pure powdered Willow Charcoal in Dyspepsia, Indigestion and all affections arising from derangements of the stomach, such as Headache, Heartburn, &c., is well known. Its value must necessarily be much increased, since it is, for the first time, presented in a convenient, reliable and unobjectionable form, in our Gelatine-Coated Pills.

IRON, DIALYSED, ... 2 grs.

Made from Merck's scales or plates of Dialysed Iron, and, about 20 times the strength of the Solutions in market.

SALICIN, ... 2½ and 5 grs.

Salicin is becoming more and more favorably known in the treatment of Rheumatic affections, also as a Tonic, Astringent, and Anti-Periodic, and is best exhibited in our Gelatine-Coated Pills. In Acute Rheumatism, Salicin has been found very efficacious, and according to "The Lancet," not less certain, than Quinine is for the Ague. In large doses, it has been claimed to be an absolute specific in Cornëitis (suppurative). Price, reduced.

MONOBROMATED CAMPHOR, ... 2 and 3 grs.

Is now being considerably used in treatment of Spermatorrhœa; strongly recommended in cases of Cerebral-Anæmia; used successfully in Infantile Convulsions from teething; Hysteria; Headache from over study or nervousness, and Nymphomania. (Dose, 3 to 4 grs.)

CALCIUM, SULPHIDE, ... 1-10 gr.

Strongly recommended "in cases of Scrofulous and other unhealthy sores, Glandular Enlargement, Boils occuring in crops, &c." In many skin diseases, it is strongly indicated, being not only Anti-parasitic and Anti-herpetic, but also stimulant and tonic.

An eminent physician, who has given much attention to the use of Sulphide of Calcium and cites several very interesting cases of cures of Abscesses, through its medium. In his words: "The Sulphide of Calcium is indicated in Scrofulous and unhealthy sores and Glandular Enlargements, in Boils appearing in crops, and in carbuncles—in any diathesis with a tendency to Abscesses with suppuration."

CERIUM, OXALATE, ... 1 gr.

Used as a remedy in the sick stomach of pregnant women, and in the vomiting of pregnancy, as well as in Phthisis, Hysteria, Pyrosis and Atonic Dyspepsia. (Dose, 1 to 3.)

PHOSPHORUS, ... 1-100, 1-50, 1-30, 1-20, 1-12 gr.

The pure transparent Gelatine we use is in no degree porous, it preserves the Phosphorus perfectly in the free state; while sugar, owing to its crystaline nature, is very porous, and will admit of rapid change in substances, of a delicate character, covered with it. We have the Phosphorus in state of solution in the excipient we employ, this insures a gradual elimination of the Phosphorus in the stomach, thus avoiding the severe irritation that is so often experienced after taking the ordinary Phosphorus Pills, which are prepared by mixing the Phosphorus in substance with the excipient, in which small fragments of Phosphorus often remain. Note remarks by Dr. Squibb, in his paper before Am. Pharm. Ass'n, Sept., '76, in which he states that Phosphorus should never be administered in substance, and if a coating be used, he commends Gelatine.

Many of the most eminent physicians throughout the country, among whom are leading specialists in the treatment of Neurotic diseases, assert that McKesson & Robbins' Phosphorus Pills are the most rational medium yet found for exhibiting Phosphorus.

PHOSPHORUS COMPOUND, McKesson & Robbins' Pills, 1/50, 1/60 & 1/100 gr.

PHOSPHORUS COMPOUND AND IRON, McKesson & Robbins' Pills.

Every drug and chemical used in McKesson & Robbins' Pills are thoroughly tested by a competent chemist, and the Pills repeatedly analyzed to prove correctness in the synthesis.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL, and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist,

Explanatory Circular mailed on application. **(P. O. Box 4,517), 2 and 4 Platt Street, New York**

Peck's Cod-Liver Oil and Wild-Cherry Bark.

Unequalled for rapid and efficient action in **Phthisis, Deficient Nutrition, etc.** Agrees with the most delicate stomach, never causes eructations, is a positive tonic. Its taste is far more agreeable than that of any other combination. It is a perfect emulsion of fifty per cent. of oil and twenty-five per cent. of bark, from which the oil does not separate, and which keeps indefinitely without change.

Dr. W. L. ATLEE, Jr., Philadelphia, writes:—"I have used your Ol. Morrh. cum Prun. Virg. in upwards of a hundred cases. The results were invariably satisfactory and very much better than I ever obtained with other preparations of Cod-Liver Oil."

Peck's Elixir of Phosphorus.

For **Paralysis, Melancholia, Lapse of Memory, etc.** A powerful **Aphrodisiac.** A clear, permanent, palatable solution, containing $\frac{1}{100}$ gr. unaltered Phosphorus in each teaspoonful.

Sold by apothecaries generally.

H. T. PECK & CO., Chemists, Philadelphia.

MELLIN'S FOOD

For Infants and Invalids,

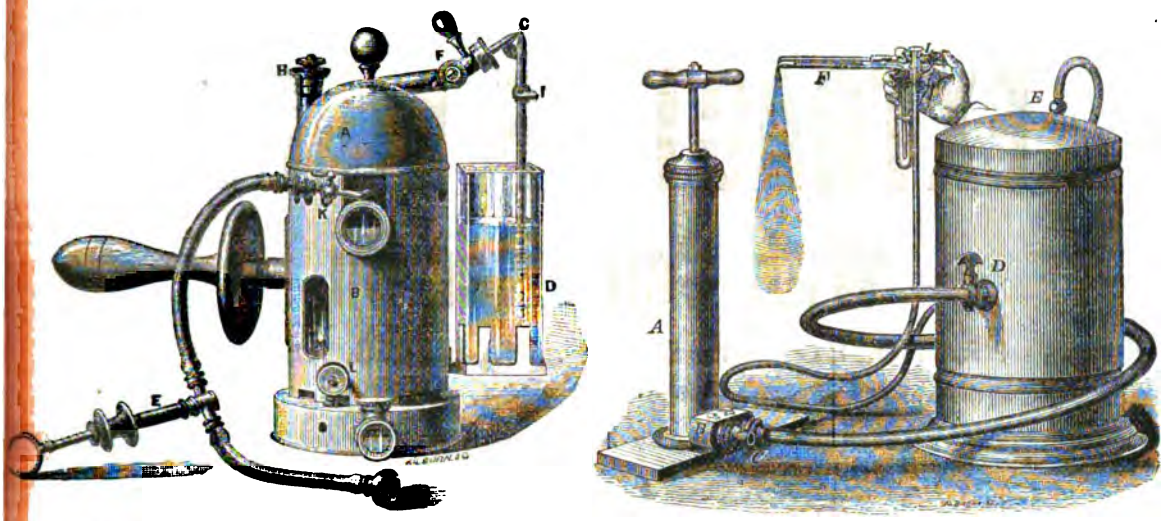
THE ANTISEPTIC ATOMIZER.



In this apparatus we have incorporated some of the best features of the Atomizing Apparatus heretofore made by us, already familiar to the profession. It is of best materials and workmanship—strong, durable, convenient, easily regulated, and by means of a new attachment of our own design, adequate without cessation of spray for any operation, or series of operations, however extended. Full description on application.

A NEW PAMPHLET

On Atomization of Liquids, with Formulæ of many articles of the Materia Medica successfully employed in the practice of a well-known American Practitioner, together with a description of the best forms of apparatus, will be sent post-paid on application. Also our new illustrated Catalogue of Surgical Instruments.

ATOMIZING APPARATUS BY COMPRESSED AIR.

This apparatus will be found entirely satisfactory on account of its elegance and perfect working qualities. It has a double acting Brass Pump (condensing or exhaust, at will), with valves unchangable by time or use. Strong Copper Receiver, Nickel Plated, 12 feet, light and flexible but strong; brown-colored Tubing and a self-closing cut-off (our own design, represented at I), readily connected with any tubes now in use.

PRICES REDUCED.

CODMAN & SHURTLEFF,

MAKERS AND IMPORTERS OF SUPERIOR SURGICAL INSTRUMENTS,

13 & 15 Tremont Street, BOSTON.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

MANUFACTURED BY

TROMMER EXTRACT OF MALT CO.,

FREMONT, OHIO.

Boericke & Tafel's

MEDICINAL TRITURATIONS

—AND—

Fresh Plant Essences.

TRITURATIONS.

We have prepared and put on the market since a number of years Triturations of Minerals, Chemicals, Metals and other Medicinal Substances, which are carefully triturated with purified Sugar of Milk, for one full hour at a time, in the proportion generally of one in ten, or one in one hundred; and it is found that by this process the action of the remedies is rendered more prompt and effective, even in minute doses, than when prescribed in the usual form in larger quantities.

Fresh Plant Essences.

Tinctures made in the usual manner, from dried roots and herbs, are variable in their effects—are often found untrustworthy. It is conceded that in drying many plants and roots lose most of their volatile constituents, and some even undergo a decided change. A case in point is Hydrastic Can., the fresh root of which possesses narcotic properties which in the dried are wanting. It is at all times difficult to detect old from freshly-garnered dried plants; hence often old and chapworn materials are used, sometimes from sheer carelessness, more often from necessity.

To obviate this difficulty, we procure of all remedies indigenous to this country, the fresh plants or roots when in their full vigor, and carefully prepare therefrom essences or tinctures, which retain their full efficacy unimpaired for years, many indeed claiming that age, as in wines, improves their quality.

Of medicinal plants indigenous to Europe, we import the essence ready prepared. The exact proportion of fresh plant or root to the tincture or essence is given with each bottle, so as to enable the practitioner to accurately determine the quantity administered.

These standard preparations are furnished in original packages, from one ounce to one pound, each bottle having our firm's name blown into the glass, the cork being secured by a metallic capsule, also bearing the firm's name.

ysicians can order either direct or through their Dr ggists, who can readily procure our goods through th bbing houses.

planatory price currents, with lists of such preparatic as we carry in stock, furnished free on application.

DRESS,

BOERICKE & TAFEL,

Manufacturing Pharmacists,

No. 145 GRAND ST., NEW YORK.

This soap is confidently offered to the medical profession and the public, as being a detergent, which, from the nature of its composition, possesses UNDOUBTED HEALING QUALITIES.

It is a preparation of useful VEGETABLE OILS, CHEMICALLY PURE GLYCERINE AND REFINED PINE TAR, in which EVERY INGREDIENT IS THOROUGHLY SAPONIFIED by a process peculiar to ourselves. We thus produce a detergent absolutely free from the valid objections frequently discoverable in soaps compounded from animal fats, which HAVE BEEN KNOWN to be POSITIVELY INJURIOUS TO THE SKIN.

This soap has already been used in many public institutions: as Nurseries, Infant Asylums, Hospitals, Dispensaries, etc., and abundant evidence, from them and from private physicians, can be given those desiring it, which will bear out all that is claimed for the remedial excellence of PACKER'S TAR SOAP.

In the treatment of

DISEASES OF THE SKIN,

This soap is of especial service: first, because while other soaps, if used, may and probably will exercise some injurious effect, this is the *least irritating of all* soaps; and second, because by virtue of its TAR and GLYCERINE, of which it contains a very large percentage.

SURGEONS find it the best soap for cleansing wounds, ulcers, etc., and for antiseptic and deodorizing purposes.

We feel the utmost confidence that the expectations of the physician will be uniformly realized, if a little pains is taken to designate PACKER'S in cases where TAR SOAP is indicated.

The Packer M'f'g Co.,

P.O. Box 4885. 146 & 148 William St., New York

WALTER BAKER & CO.'S CHOCOLATE AND COCOA

These Preparations have been the standard of purity and excellence for nearly one hundred years and have gained a world-wide reputation. They are pure, nutritious and healthy. Cocoa contains as much flesh-forming matter as beef.

Broma, an excellent food for Invalids, and unrivalled in delicacy and aroma. Breakfast Cocoa,—a general favorite. Baker's No. 1 Chocolate, the very best preparation of plain Chocolate in the market. Vanilla Chocolate, unsurpassed in flavor and quality.

Awarded the highest premium at the Paris, Vienna, and Philadelphia Expositions.

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end), *20 cents*
Seven " " " " " *$1.00.*
Crusts, each (Hermetically Sealed), ... *2.00.*

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of information may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 223 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free.
A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine. Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

215 South Front Street, Philadelphia.

Printed Pills and Granules

These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the pertection of accuracy, and a safeguard against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacists rests on the entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal:

Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.

The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***

LAZELL, MARSH & GARDINER'S POWDERED MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weights for the Solid Medicinal Extracts.*

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.		per oz.

NOW READY.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS

By SIDNEY RINGER, M.D.,

Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price, - - - - - $4.50

"Upon the appearance of that now indispensable work, *Ringer's Handbook of Therapeutics*, my attention was particularly attracted to the frequency with which he recommends small doses of medicine that we have been accustomed to use in much larger doses for entirely different diseases. Some of these remedies were recommended so strongly, that I was induced to give them a trial, more especially as my practice among children compels me, for many reasons, to administer as little unpleasant-tasting medicines as possible. Their use with children first having been found satisfactory, my position in connection with the New York Dispensary afforded me the opportunity of further testing them in numerous cases of adult."—DR. DESSEAU *in Medical Record, July* 28, 1877.

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on Therapeutics."—*St. Louis Med. and Surg. Journal.*

CHAMPION SPOUTING SPRING NATURAL WATER
FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For ***Headache,*** or disordered state of the Stomach arising from the use of wines or hearty eating it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast.

and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties: it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. ***Delivered free of Charge.***

Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. ***Delivered at the Cars.***

Pints, 4 dozen in a case..... $8 00
Quarts, 2 dozen in a case..... 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.,** or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

NELATON'S CATHETERS,

Sometimes called Jacques', but really the invention of Dr. Nelaton, Surgeon to the late Emperor Napoleon III., have, by their decided advantages over every other kind, become a necessity in the practice of the leading Physicians and Surgeons of Paris, London, and other European Cities.

Their introduction here has been so successful that imitations are already in the market, much inferior in quality. Having secured a large stock from the original manufacturers during my stay in Paris, I am enabled to offer the genuine at a reasonable price.

These are made of *pure brown rubber*, with a smooth, soft surface, delicately flexible; and if the simple directions on the box are followed, their introduction will cause little or no pain, and effect their purpose much more easily and effectively than any other kind.

Sets of nine sizes, numbered and with wire, the whole neatly boxed, will be sent by mail on receip of $6.00. THEO. RICKSECKER, 146 & 148 William St., New York.

Please mention Medical Record.

PRESCRIPTION AND CLINIC RECORD.

The pocket-book of every careful physician. The best medium between physician and druggist—gives trusty record of cases—mathematical dates of monographs—of hereditary tendencies—of medical statio. Author and copyright, E. SEGUIN, M.D., 41 West 20th St., New York. One copy, 35c.; four copies, $1; 500 copies, $100; by the 1,000; $150.

SHEDDEN'S FOODS FOR THE DIABETIC AND DYSPEPTIC.

The prepared Flour of Bran, freed from Starch by Camplin's process, in 10 lb. cases, $5.00. Gluten Flour, rich in nitrogenous matter and the phosphates, in 10 lb. cases, at $3.00.

SHEDDEN & CO., Broadway, cor. 34th St., New York.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

Cerebral Congestion, Headache, Indigestion, Bile, Hemorrhoids, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs Belin and Tardieu, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. Grillon, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of CASWELL, HAZARD & CO., New York, and of all respectable Chemists throughout the world.

SOLUBLE TABLETS, TABLET TRITURATES, PILL & TABLET SATURATES

MADE ACCORDING TO DR. ROBERT M. FULLER'S METHOD.

These tablets, from their ready solubility or diffusibility, are destined to come into general use in the profession. Their advantages can be appreciated at once when they are allowed to dissolve in the mouth or in a teaspoonful of water. They are readily soluble in the mouth or stomach, or diffusible in a teaspoonful of water, and thus administered.

We make the following abstract from an address read by Dr. ROBERT M. FULLER, before the New York Academy of Medicine, and published in "The Medical Record" March 9th, 1878, in which he makes known an accurate method he has devised for dispensing certain medicines in separate doses, in a compact and palatable form:

"The inability frequently experienced by physicians to obtain certain medicines, in separate doses, of a desired formula and mode of preparation, led me, some time ago, to undertake a series of pharmaceutical experiments with a view of contriving some simple, inexpensive and readily available method of preparing the medicines so desired."

"After a number of varied and careful experiments, I succeeded in devising four methods of preparation."

"The preparations in question I have named *soluble tablets, tablet triturates*, and *pill* and *tablet saturates*, the former being designed for any powders which are to be administered in certain required doses, and the latter for certain fluid extracts, or other standard concentrated solutions."

"*Physicians practising in the country, to whose use they are adapted by reason of their economy, dose-accuracy, compactness, and palatable form for dispensing, will find them almost indispensable.*"

"The SOLUBLE TABLETS generally consist simply of certain medicines made into soluble paste with the aid of sugar of milk, and alcohol, or water. The tablets are intended to embrace any medicines that can be made into a paste which is not too tenacious, such as fluid extracts, or sugar of milk containing *one* per cent. of chemical, such as arsenious acid, sulphate of morphia, muriate of ammonia, etc."

"The TABLET TRITURATES consist of triturations of metallic, mineral, and vegetable medicines. These triturations, with sugar of milk, are mixed with alcohol of any per cent., or water, according to the adhesiveness required, and the paste thus formed is then readily made into tablets of any size."

"The TABLET SATURATES are merely porous troches, or tablets designed for saturation. The difference between the tablets and the pills, beyond the difference in shape, being that the former will absorb a much larger quantity of fluid extract, or other standard concentrated solution, than the latter."

"The PILL SATURATES possess two favorable qualities, namely: they are made easily, and at an extremely low cost. Either of the above are of various sizes, and sold by the ounce or pound, for medication."

☞ We have these tablets either medicated or plain, for medication, and can supply physicians with them. Medicated according to any formula desired, and will make special rates when 100 or upwards are ordered.

CASWELL, HAZARD & CO.,

Fifth Ave., cor. 24th St.; & Sixth Ave., cor. 39th St., New York.

PHOSPHORUS COMPOUNDS

AND OTHER NEW ADDITIONS TO

McKesson & Robbins' Gelatine-Coated Pills.

PHOSPHORUS, DIGITALIS & EXT. HYOSCYAMUS,

Phosphorus	1-50 gr.
Pulv. Digitalis,	1 gr.
Ext. Hyoscyami,	1 gr.

Pronounced a valuable medicine as a heart tonic. The tonic effect of Digitalis on the involuntary muscular fibre is claimed to be analagous to that of Strychnine on the involuntary muscular system. Dose, 1 pill two or three times a day, at equal intervals, which should be ommitted when effect is produced upon the head, stomach, pulse or kidneys.

PHOSPHORUS & EXTRACT ACONITE,

Phosphorus,	1-50 gr.
Ext. Aconiti Alc.,	1-16 gr.

A combination recommended by an eminent English physician in the treatment of Phthisis with Pyrexia. Dose, 1 pill every four hours.

PHOSPHORUS & EXT. CANNAB INDIC.,

Phosphorus,	1 50 gr.
Ext. Cannab Ind.,	1-4 gr.

A good narcotic, when Morphia should not be administered, and recommended as an aphrodisiac in the place of Nux Vomica. Dose, one or two pills two or three times a day with food.

PHOSPHORUS, Ext. NUX VOM. & Ext. ALOES,

Phosphorus,	1-50 gr.
Ext. Nucis Vomicæ,	1-4 gr.
Ext. Aloes Soc.,	1-2 gr.

A good dinner pill, useful in atonic dyspepsia, hypochondria and other nervous affections accompanied by habitual constipation. When, in administering, for some time, Phosphorus and Iron, or Phosphorus and Quinine, constipation is induced, this pill may be substituted with advantage once a day between doses. Dose, one immediately after dinner.

PHOSPHORUS, Ext NUX VOM. & CARB. IRON,

Phosphorus,	1 50 gr.
Ext. Nucis Vomicæ,	1-4 gr.
Ferri Carb,	1 gr.

Dose, one or two pills at each meal with food.

PHOSPHORUS IRON & ALOES,

Phosphorus,	1-50 gr.
Ferri Sulph. Exsic.,	1 1-2 grs.
Ext. Aloes Soc.,	1 gr.

PHOSPHORUS, MORPHIA & VAL ZINC.

Phosphorus,	1-50 gr.
Morphiæ Sulph.,	1-12 gr.
Zinci Valerianas,	1 gr.

Recommended as a quieting influence in Phthisis when there is hysterical irritability and hacking cough without much fever. Dose, one pill two or three times daily, or two upon going to bed.

PHOSPHORUS, NUX VOMICA & CANTHARIDES,

Phosphorus,	1-50 gr.
Pulv. Nucis Vomicæ,	1 gr.
Tinct. Canthar. Conc.,	1 minim.

Recommended as a gentle stimulant to the genito-urinary organs, a useful remedy in incontinence and retention of urine, and in premature loss of sexual power. Also successfully prescribed in some cases of Amenorrhœa and Leucorrhœa. Dose, one or two pills two or three times a day with food.

PHOSPHORUS & QUININE,

Phosphorus,	1-50 gr.
Quiniæ Sulph.	1 gr.

Physicians can readily see the value of this pill as a nutritive tonic.

PHOSPHORUS, QUINIA, IRON & STRYCHNIA,

Phosphorus,	1-100 gr.
Quiniæ Sulph.,	1 gr.
Ferri Redact.,	1 gr
Strychnia,	1-60 gr.

By some preferred to Pills of Phosphates Iron, Quinine and Strychnine.

PHOSPHORUS & STRYCHNIA,

Phosphorus,	1-50 gr.
Strychnia,	1 60 gr.

PHOSPHORUS SULPH., ZINC, & LUPULIN,

Phosphorus,	1-50 gr.
Zinci Sulphas,	1 gr.
Lupulina,	1 gr.

ALL of McKesson & Robbins' Gelatine-Coated Pills can be found at my Pharmacy.

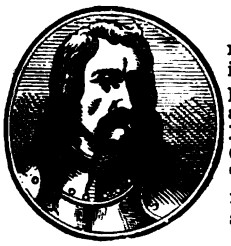
T. H. SAYRE, Dispensing Chemist, 6th Av., cor. 46th St., New York.

On receipt of $1 00, I will mail to Country Physicians Samples of ANY or ALL kinds of the above pills as they may direct.

THE GREAT EUROPEAN NOVELTY.

HUNYADI JANOS.

NEW APERIENT WATER.



Specially recommended for richness in aperient salts, and its efficacy in Bilious attacks, prevention of Gout, Piles, etc., and as an ordinary aperient, by LIEBIG, VIRCHOWS, CANZONI, and SIR HENRY THOMPSON, and the entire medical profession in England and Germany.

DR. J. MARION SIMS, New York: "As a laxative, I prefer it to every other mineral water"

DR. JAMES R. WOOD, New York: "Certain, but gentle and painless; superior to any other bitter water"

DR. WM. A. HAMMOND, New York: "The most pleasant and efficient of all purgative waters."

DR. ALFRED L. LOOMIS, New York: "The most prompt and most efficient; specially adapted for daily use."

DR. FORDYCE BARKER, New York: "Requires less, is less disagreeable and unpleasant than any other."

DR. LEWIS A. SAYRE, New York: "Preferred to any other laxative."

A WINEGLASSFUL A DOSE.

Every genuine bottle bears the name of THE APOLLINARIS COMPANY, (limited,) London.

Sole Agents for United States and Canadas.

FOR SALE BY DEALERS, GROCERS AND DRUGGISTS.

Pullna Bitterwater.

The only Bitterwater that received the Prize at the International Exhibition in Philadelphia in 1876.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

Children are equally benefited by it, and it is prescribed for them in doses of a tablespoonful in milk at night, either cold or warm.

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 18, 1876.)

Please specify, in ordering from any wholesale house, **Warburg's Tincture,** made by **F. A. REICHARDT.**

Price per bottle, 1 oz., **75c.**; per doz., **$5.00.** Per pint, **$5.00**; per doz., **$50.00.**

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

F. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ¼ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen; **$10.00** per gross.

F. A. REICHARDT, Pharmacist,

404 Fourth Avenue, corner 28th Street, New York.

SEABURY & JOHNSON,

Originators and Manufacturers of

U. S. PHARMACOPŒIA MEDICINAL AND SURGICAL

Plasters POROUS AND SPREAD in Rubber Combination

NEW YORK AND LONDON.

Received highest and only Award (Medal and Special Diploma of Merit) over all Foreign and Home Competitors in 1876.

THE JURORS' AWARD IS SUBSTANTIALLY.

ORIGINALITY.—The successful application of Rubber as a base for all medicinal and mechanical plasters.

RELIABILITY and general excellence of manufactures.

FACTS CONCERNING MEDICINAL PLASTERS IN RUBBER COMBINATION.

Indiarubber-spread and Porous Plasters possess indisputable advantages over all other Plasters: (1) The Rubber Combination preserves the incorporated drug or extract from decomposition or volatilisation; (2) They adhere closer and firmer; (3) They do not soil the skin or linen; (4) They are always pliable, and never become hard or brittle; (5) They adhere without heat or moisture; (6) An increased effect is obtained by being porous, as the Plaster neither slides nor moves from its affixed position.

BELLADONNA PLASTER, U. S. P.

IN RUBBER COMBINATION.

Messrs. SEABURY & JOHNSON claim that theirs is the most thoroughly reliable and only strictly officinal Belladonna Plaster ever offered the medical profession. It is an improvement on other Belladonna Plasters in several important particulars. First, it is incorporated with the officinal alcoholic extract only. Secondly, it is freed from all stimulating qualities, thereby insuring the uninfluenced sedative action of Belladonna. Thirdly, it adheres with greater tenacity than others. Physicians have been prejudiced in favor of Allen's English Extract; but recent analysis, fairly conducted by competent chemists, emphatically condemns the Inspissated Extract as a mild and unstable product, representing but one-half or less than one-half of the strength of the U. S. P. Alcoholic Extract of Belladonna. The following result, published in the *American Journal of Pharmacy*, in April, 1876, page 145 is furnished for your consideration, which indicates the following percentage of Atropia in the respective extracts:

Alcoholic Extract Belladonna, U. S. P. 2,571
Allen's English Extract..... 1,411
Herring's English Extract..... 1,179

The practitioner, as well as ourselves, has but one choice.

Considering these features from a professional standpoint, we offer a Belladona Plaster which cannot be improved upon.

SALICYLATED SURGEONS' RUBBER ADHESIVE PLASTER.

This article has met with unprecedented success, and has been emphatically pronounced by our most skilful General and Orthopædic Surgeons, as "the best Surgeons' Adhesive Plaster known". It is applied without heat or moisture, conforms quickly to the parts; is perfectly flexible and waterproof, and is ready for use at any moment. It is free from irritating properties and very healing. In counter-extension it has no equal, as it does not move or slide after being applied. Our India Rubber Adhesive Plaster is also spread on twilled linen, which resists the most powerful strain. In addition to these general improvements, the plaster being impervious to water, wounds can be cleansed without removing the plaster, obviating the necessity of constant redressing, saving labor and time. **Whenever continued powerful adhesion is required, it should be procured in porous form.**

MUSTARD PLASTER (spread on Cotton Cloth).

Our Mustard Plaster is a decided improvement over the best French makes; the mustard is manipulated so as to exclude all the moisture, retaining unimpaired by such treatment its essential properties. They are always reliable, conform quickly to the part, and when thoroughly wet do not break into pieces, as is the case with all other mustard plasters. They do not crack or peel off, and can be removed without soiling the skin or linen. Being **manufactured only of pure mustard,** they are perfectly free from Croton Oil or other dangerous substitutes, often employed to induce intense irritation.

RUBBER BLISTER PLASTER (Camphorated) B. P. STRENGTH.

This article has a splendid reputation; its characteristic action is not impaired by age in any climate. The whole fly is incorporated, which by constant manipulation is thoroughly and beautifully combined with the plaster. **Its properties are developed quicker, and its blisters in less time than the cerate.** It never fails to blister when used as directed. In addition to its superior efficacy as a vesicant, we incorporate a sufficient quantity of Camphor, which, with the Olive Oil, used on the face of the plaster, **prevents Strangury.** This improvement will be appreciated by every practitioner. It is more reliable than any known cantharidal preparation.

CAPSICUM PLASTER.

Recently this article has crept into favor with our most esteemed physicians, and judging from results it is doubtless the best rubefacient known. It has the specific action of mustard without its objections. The characteristic action of Capsicum is uniformly maintained from twenty-four to forty-eight hours, without blistering, being mild, continuous, and stimulating. This plaster is spread in rubber combination and in porous form. Experience has taught practitioners that the Oleo Resin of Capsicum is too violent, frequently vesicating; we incorporate the crude drug in sufficient quantity without risk to the patient. Our Capsicum Plasters will be found more practical for general use than the **so-called Mustard or Capsicum Papers.**

SPECIAL NOTICE TO PHYSICIANS.

Quality is of great importance to the practitioner: by reliable preparations he supplements his own skill. You can therefore rest assured that every article we manufacture is of strict pharmacopœia strength, and incorporated with perfectly reliable Extracts and Drugs, well selected, carefully and conscientiously prepared, and manufactured invariably under the personal superintendence of one of our firm. **Our whole attention and study is devoted entirely to the art of Plaster making,** and we are ready at all times to receive suggestions from the fraternity, which may be of benefit to all.

THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors; billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton [L. I.], N. Y.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar.

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1877, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

WM. H. BYFORD, A.M., M.D., President.

T. D. FITCH, M.D., 296 West Monroe St., Secretary.
CHAS. W. EARLE, M.D., 37 Park Ave., Treasurer.

Official Announcements of the Medical Colleges of the U. S.

[The Fourteenth Annual Course of Lectures in the

Medical Department of the University of Wooster,

LOCATED AT CLEVELAND, OHIO,

Will begin Wednesday, October 3d, 1877, and continue until the last Wednesday in February, 1878. Medical and Surgical Clinics, Monday and Tuesday, Thursday and Friday of each Week, at Charity Hospital. The Preliminary Term commences Sept. 19. The Summer Course of Recitations and Clinics begins April 2, 1877, and continues 12 weeks.

FACULTY:—G. C. E. WEBBER, M.D., Dean; L. FIRESTONE, M.D., LL.D.; W. J. SCOTT, M.D.; H. J. HERRICK, M.D.; CONWAY NOBLE, Esq.; A. C. MILLER, M.D.; JOEL POMERENE, M.D.; D. B. SMITH, M.D.; H. W. KITCHEN, M.D.; T. CLARK MILLER, M.D.; JOHN H. LOWMAN, M.D.; G. T. GENTSCH, P.C. For Circular and Catalogue, address H. W. KITCHEN, Sec'y, No. 3 Euclid Avenue, Cleveland, O.

CLEVELAND MEDICAL COLLEGE,

Cor. St. Clair and Erie Sts. Founded 1843.

FACULTY:—JARED P. KIRTLAND, M.D., LL.D.; J. L. CASSELS, M.D., LL.D.; PROCTOR THAYER, M.D.; JOHN BENNITT, M.D., Dean; JACOB LAISY, M.D.; JOHN E. DARBY, M.D.; E. W. MORLEY, M.A.; FRANK WELLS, M.D.; ISAAC N. HIMES, M.D.; X. C. SCOTT, M.D.; B. W. HOLLIDAY, M.D.; N. P. SACKRIDER, M.D.; LEWIS BUFFETT, M.D.; H. H. POWELL, M.D.; WILLIAM WALLACE HOLLIDAY, M.D.

FEES.—Lecture Tickets, including Matriculation and Demonstrator's Ticket, $50. WINTER SESSION.—Commences on the third Wednesday in September, and continues 24 weeks. SUMMER SESSION.—Commences on the first Monday in April.

Medical School of Maine,

AT BOWDOIN COLLEGE.

Fifty-Eighth Annual Course of Lectures for 1878 will commence February 14, and continue sixteen weeks.

FEES.—Matriculation (payable each term), $5.00. Full Course (in advance), $75.00.

ALFRED MITCHELL, M.D., Secretary, BRUNSWICK, ME.

Woman's Medical College of Pennsylvania.

THE TWENTY-EIGHTH WINTER SESSION

Will open on Thursday, October 4, 1877, in the commodious new College Building. Clinical instruction is given in the WOMAN'S HOSPITAL, Pennsylvania, *Wills, Philadelphia* and *Orthopædic Hospitals*. *Spring Course* of Lectures, Practical Demonstrations, and *Winter Quizzes* are free (except for expense of material) to all Matriculants of the year.

Address RACHEL L. BODLEY, A.M., *Dean*, North College Ave. and 21st Street, Philadelphia, Pa.

WANTED.

Those of our Subscribers who have received duplicate copies of No 323 and 361 of THE MEDICAL RECORD will greatly oblige the Publishers if they return them by mail to

WM. WOOD & CO., 27 Great Jones St., New York.

LONG ISLAND COLLEGE HOSPITAL, BROOKLYN, N. Y.

Annual Announcement and Circular, 1877-78.

The READING AND RECITATION TERM will commence October 4, 1877, and close February 14, 1878.
The REGULAR TERM will open March 5, 1878, and close the last week in June following.

FACULTY OF THE COLLEGE.

SAMUEL G. ARMOR, M.D., LL.D., Professor of the Practice of Medicine, and Dean.
GEORGE W. PLYMPTON, A.M., Professor of Chemistry.
JOSEPH H. RAYMOND, M.D., Professor of Physiology.
DANIEL AYRES, M.D., LL.D., Emeritus Professor of Surgery.
ALEXANDER J. C. SKENE, M.D., Professor Diseases of Women and Children.
EDWARD SEAMAN BUNKER, M.D., Professor of Obstetrics.
CORYDON L. FORD, M.D., Professor of Anatomy.
JARVIS S. WIGHT, M.D., Professor of Surgery, and Registrar.
JOHN D. RUSHMORE, M.D., Professor of Materia Medica.

THE CLINICAL ADVANTAGES OF THE LONG ISLAND COLLEGE HOSPITAL ARE UNSURPASSED IN THIS COUNTRY.
For circulars, address DEAN or REGISTRAR.

NOW IS THE TIME TO SUBSCRIBE FOR THE

Cincinnati Lancet & Observer

THE LEADING WESTERN MEDICAL JOURNAL.

It has an able corps of Contributors, gives a condensed statement of the Progress of Medical Science, reviews the latest Medical Works, publishes Society Proceedings, and keeps its readers informed of the Medical News of the day.

The *LANCET AND OBSERVER* is enlarged to 104 pages of reading matter every month. It is handsomely printed on fine, tinted paper, neither labor or expense being spared to adapt it to the wants of the American Practitioner of Medicine and Surgery.

SPECIAL INDUCEMENTS

to New Subscribers for 1878. Forward your subscription at once, and you will receive the Journal from Oct., 1877, to Dec., 1878,

Fifteen Months for $3.50.

SPECIMEN COPY, 25 CENTS.

ADDRESS ALL COMMUNICATIONS TO

DR. J. C. CULBERTSON,

281 West Seventh Street, Cincinnati, O.

An increase of 200 pages additional Reading Matter in a year will be made in

THE AMERICAN JOURNAL OF OBSTETRICS

And Diseases of Women and Children.

PAUL F. MUNDÉ, M.D., Editor.

In consequence of the great increase in the number of subscribers to the AMERICAN JOURNAL OF OBSTETRICS the past year or two, the Publishers take pleasure in announcing that, beginning with January, 1878 (Vol. XI., No. 1.), they will permanently increase each number by *fifty additional pages*, thus giving its subscribers annually about

ONE-THIRD MORE READING MATTER

than heretofore, or, a volume of 896 large octavo pages with *no change in the subscription price.*

An increased number of illustrations, both wood engravings and lithographed plates, may also be expected in future volumes.

While the prosperity of the AMERICAN JOURNAL OF OBSTETRICS, and this consequent substantial evidence of it, cannot fail to be gratifying to all its subscribers and other friends, the Publishers trust the Medical Profession will take this voluntary action on their part as an earnest of their desire and intention, so far as in their power, to make all their publications merit the liberal support which is given them.

Subscription Price, $5.00 per year, invariably in advance.

☞ If any subscriber has a friend to whose notice he would like to commend the Journal, the Publishers will be pleased to mail a Specimen Copy to any address furnished them.

Medical Pictures and Portraits

For PHYSICIANS' OFFICES.

Harvey Demonstrating the Circulation of the Blood

A fine photograph, from a valuable engraving.

Size, 7x9 inches, on fine white mount, 13x16. Price, $1.50
Size, 15x18 " " " 22x26. " 4.00
The engraving of the above is entirely out of print.

THE ANATOMICAL LECTURE.

(After Rembrandt.)

A fine photograph, in both size and price same as Harvey, making a fine companion picture.

THE ANATOMIST.

From a painting by the great artist Max of Germany.

It represents a Professor in deep study, sitting by the side of a female subject of great beauty.

A Fine Etching. Price, $1.00
Or, Proof Copies. " 1.25

JENNER VACCINATING A CHILD

Photograph.

Size, 8½x10 inches, on fine white mount . Price, $1.50.

AMBROISE PARÉ.

To this celebrated French surgeon is attributed the introduction or first use of Ligatures, instead of the old mode by the actual cautery. It represents an operation on the leg of a soldier on the battle-field, surrounded by several eminent men who are looking on with great interest. This engraving, now very scarce and rarely found, has been published in fine Photograph, in three sizes, viz.:

7x9 inches, on white mount, 15x16. Price, $1.50
15x18 " " " 22x28. " 4.00
7x13 " on granite " 11x19. " 2.00

HIPPOCRATES.

A fine photograph from an old and valuable engraving.

Size, 11x14 inches. Price, $1.00.

PHOTOGRAPH PORTRAITS OF

(Imperial Size)

SIR ASTLEY COOPER,
DR. JOHN HUNTER,
DR. RICHARD BRIGHT.
} Price, 50 cents each.

THE LUNATIC ASYLUM.

This remarkable picture by KAULBACH, represents a scene in the yard of a Mad-House. A group of unfortunates, each one occupied with the ideas of his own fancy. One as a king, another as a miser, and so on. As a composition and study, it is one of great interest.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

ANDRÈ VÈSALE.

A picture of this celebrated anatomist, at work in his attic, listening to approaching footsteps.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

Prof. CHAS. A. BUDD.

A photograph from life of the late Prof. C. A. Budd, and the only portrait approved of by himself and family. A fine likeness.

Imperial size, from life. Price, 50 cents.

OTHER PHOTOGRAPHS ARE IN PREPARATION.

Sent by mail, post-paid, on receipt of price.

WM. WOOD & CO., 27 Great Jones Street, New York.

In corresponding with Advertisers please mention **The Medical Record**

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion, may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatizing Cod-Liver Oil, the active digestive priciple of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Peptodyn, the New Digestive, is a combination of the whole of the digestive secretions—Pepsine, Pancreatine, Diastase, &c., forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition.

N.B.—*The success of this Remedy has led to several imitations of it*, which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

SAVORY & MOORE'S BEST FOOD FOR INFANTS

Tins, 1/-, 2/-, 5/-, 10/-

AS SUPPLIED TO

THE ROYAL NURSERIES

of England, Russia, Etc.,

AND CONTAINING THE

HIGHEST AMOUNT OF NOURISHMENT

IN THE

MOST DIGESTIBLE AND CONVENIENT FORM.

THE MOST PERFECT SUBSTITUTE FOR HEALTHY MOTHER'S MILK.

DATURA TATULA FOR ASTHMA, ETC.

A powerful and universally adopted Remedy.

"By immediate contact with the air cells and passages, instant relief is given."—Dr. LATHAM, *Physician to the Queen.*

"A remedy of great power and usefulness in Asthma, Chronic Bronchitis, &c."—Dr. W. BARKER.

"The smoke causes no nausea. I have never known an instance in which relief was not obtained."—GENERAL ALEXANDER.

In Tins, for use by means of a pipe, Cigars and Cigarettes, and Pastilles for Inhalation.

SAVORY & MOORE, 143 New Bond Street, London.

Agents for America—E. FOUGERA & CO., NEW YORK.

Phila., 1876. Medal of Merit.

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

Prepared by CLIN & CO., Pharmacists, Paris.

LA PLATA EXTRACT OF MEAT.

CH. DELACRE,
Sole Consignee,
IXELLES, BELGIUM.

Agents for the U. S.,
E. FOUGERA & CO.,
NEW YORK.

This Extract is a pure extract of Beef, prepared according to the improved process of Baron von Liebig, unsurpassed in quality, free from fat and gelatine, each pound of which contains the soluble nutritive constituents of 34 to 36 pounds of the finest beef, exclusive of bones and fat, corresponding to about 45 pounds of good butcher's meat. As a medicinal agent it will be found of great value to the sick, invalid, and persons and children of weak constitutions. ***It will keep unaltered for years in any climate.***

CAUTION.—Physicians wishing to use a pure extract of beef will do well to specify the ***"La Pluta,"*** since it is never offered for sale until it has been analysed by Mr.

CH. DELACRE, Chemist, General Consignee at Brussels,

and found by him to possess the essential qualities of the best articles of this kind.

None genuine without the above trade-mark—*Bullock reclining.*

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

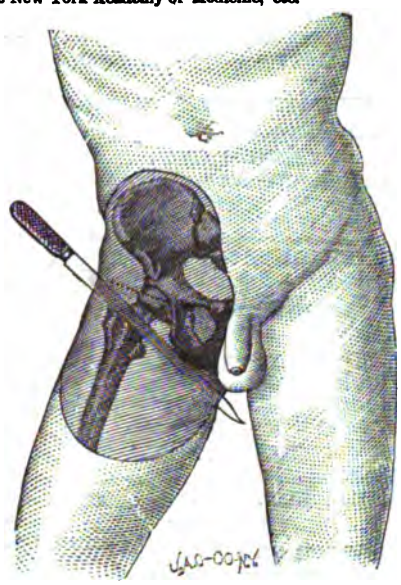
ON SURGERY

THE PRINCIPLES AND PRACTICE.

By FRANK HASTINGS HAMILTON, M.D., LL.D.,

Professor of the practice of Surgery with Operations, and of Clinical Surgery in Bellevue Hospital Medical College; Visiting Surgeon to Bellevue Hospital; Consulting Surgeon to the Bureau of Surgical and Medical Relief for the Out-Door Poor at Bellevue Hospital; to the Central Dispensary, and to the Hospital for the Ruptured and Crippled; Fellow of the New York Academy of Medicine, etc.

In one royal octavo volume of about 1,000 pages, illustrated by 467 Engravings on wood.
Price, in extra muslin, $7.00; or in leather, $8.00.



Anatomy of Hip Joint, and Guides for the Knife.

NOTICES OF THE PRESS.

"Has evidently been prepared with the greatest care, both on the part of the author and his publishers; and as a text-book for the students, it reflects the highest credit upon its well-known and gifted writer. As a text-book for the student, or one of reference for the busy practitioner, it undoubtedly is one of the best and *most modern* that has yet appeared."—*The Medical Record.*

"A valuable addition to our list of text-books, an excellent work of reference, a credit to our professional literature."—*New York Medical Journal.*

"It will be found an excellent and common-sense volume."—*London Medical Times and Gazette.*

"This is one of the best text-books upon Surgery which we have ever seen, and we recommend it highly to the profession."—*Chicago Medical Examiner.*

"Prof. Hamilton's latest work is one that will add to his already high reputation. . . . It is full of valuable practical suggestions and directions."—*Am. Journal of Medical Science.*

"American in plan, scientific in method, written in clear, concise, classical English, Prof. Hamilton's Surgery is a noble legacy to the medical student, an honor to the profession, and an ornament to our native tongue."—*Detroit Review of Medicine.*

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

MESSRS. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

THE MANUFACTURERS,

KEASBEY & MATTISON,

332 N. Front Street, Philadelphia.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

WARNER & CO.'S
SUGAR-COATED QUININE PILLS.

(With Twenty-Six Combinations.—See List.)

QUININE PILLS of our make are prepared from *Sulphate of Quinia* of American manufacture, noted for its purity and excellence. Each Pill contains the full complement of material as expressed on the label, without the necessity of adding any excess to compensate for impurities. They are perfectly soluble, and physicians can depend upon getting the full benefit of this valuable remedy in a pleasant form.

SUGAR-COATING, properly applied, does not impair the quality of such medicines as are commonly thus enclosed. *Dr. W. S. Edgar, Editor, says:*—"We procured a variety of W. R. WARNER & Co.'s preparations, and have prescribed them as opportunity offered, with *satisfactory evidence of their purity*, and reliability as to the quantity in each dose; also, we extract the following paragraph from a letter by a competent analytical chemist:"—

SUGAR-COATED QUININE PILLS.

"I take pleasure in testifying that W. R. WARNER & Co.'s QUININE PILLS are practically just what they claim to be, whether judged by analytical tests or by the therapeutic effect obtained from their use.

DETROIT, MICH. "A. B. LYONS, M.D., *Analytical Chemist.*"

WILLIAM R. WARNER & CO., Manufacturers of Sugar-Coated Pills,
1228 Market Street, Philadelphia.

SCOTT'S EMULSION
PURE COD LIVER OIL
WITH
HYPOPHOSPHITES OF LIME AND SODA
PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

GENTS, SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

BEDFORD (VA.) SPRINGS WATER & MASS.

Standard Natural Remedies endorsed by Medical profession for Throat, Skin, Stomach, Blood and Uterine Diseases. Efficiency attested by results in thousands of cases during the last 25 years. Full proof, with analysis and directions, sent with each package. Prices: Water, $4.00 case; Mass, $1.00 package, or $10.00 a dozen. Liberal terms to the trade. Special rates to physicians. "Successfully used for Dyspepsia, Diarrhœa and Female Complaints."—Prof. Sam'l Jackson, M.D., Univ. of Penn. "Invaluable for Neuralgia and Nervous Diseases."—Geo. T. Hartison, M.D., Woman's Hospital, N. Y. "Unequaled for diseases peculiar to females."—John P. Metteaer, M.D., LL.D., of Va. "Specific for Scrofulous and Cutaneous Affections."—J. M. Allen, M.D., of N. C. "Excellent Tonic Alterative and Diuretic—one of Nature's greatest remedies."—Medical Asso. of Va., Lynchburg. Address, **A. M. DAVIES, Prest. of the B. A. & I. S. Co., Lynchburg, Va.**

Original Lectures.

CLINICAL LECTURE.

DELIVERED AT THE PENNSYLVANIA HOSPITAL.

By JACOB M. DA COSTA, M.D.,

PROFESSOR OF PRACTICE OF MEDICINE IN JEFFERSON MEDICAL SCHOOL, PHILADELPHIA.

(Reported for THE MEDICAL RECORD.)

I. *Cerebral Tumor.*

II. *Syphilitic Meningitis—Gummy Tumor.*

III. *Cerebral Congestion as a Result of Syphilitic Arteritis.*

CEREBRAL TUMOR.

R. B., 35 years of age, is a house-painter by trade. He had chancres five years ago. These were not followed, however, by any constitutional symptoms. In July last, while attending a political convention, he drank a great deal, was, in fact, intoxicated for a week. This carousal was followed by a severe pain in the head which seriously affected his sight. Soon after this he had an attack of vomiting. Since that time his headache has never left him, but has constantly increased in severity. Vomiting was occasional at first, but has not lately been a feature of the disease.

Since the patient has been admitted to the hospital, it has been impossible to obtain from him any connected history of his malady. His answers have been faulty. His intellect is evidently much obscured. The chief symptom which he complains of is the constant and excruciating pain in his head. This pain has lately been associated with marked disturbance of vision. He sees imperfectly; speaks of spots before his eyes. You notice that the balls of his eyes are very prominent. At present the poor fellow is not only a great sufferer from headache, but is also subject to the most strange hallucinations and the actor in a great variety of imaginary scenes. He cannot possibly stand without support. The muscles of his legs are exceedingly weak and his grasp most feeble, that of the left hand especially so. He is also subject to curious, irregular spasms and tremblings. There is evidently in this case some most marked and serious brain affection. The temperature is usually but little above normal, once it ran up to 101°. Ophthalmoscopic examination reveals a marked choking of the retinal discs. The urine has been carefully examined and found to be free from sugar and albumen.

Within the past week the most prominent symptom has been the mental disturbance in the shape of delirium and hallucination. The headache is about the same. The man is less conscious of his actions; spits on the floor, and has involuntary discharges from the bowels. He has lost, therefore, to a certain degree, both mental control and moral sense. There is a daily increasing tendency to spasmodic contractions of the muscles of the neck. His neck, you see, is bent back.

What is the matter with the patient? I think he has a cerebral tumor which gives rise to these symptoms. On what facts do I base my diagnosis? You will first ask me this question; then you will want to know if there are any other maladies followed by the same general symptoms. I base my diagnosis on these three points chiefly. (1.) The excessive, persistent headache. (2.) The general asthenia, particularly the loss of power in the extremities. (3.) The evidence of pressure inside of the skull, as shown by the marked choking of the discs, the great exophthalmos and the obvious defects of vision. To these, however, a few more points may be added. I would call particular attention to the tendency to spasmodic contractions—as exhibited by the muscles of the neck and forearm. Such contractions point generally to some irritative lesion of the brain, which generally turns out to be a tumor. Another argument which has great weight in leading me to this diagnosis is the fact that the man's mind has been so long unobscured. Not until lately has it been more affected than it would necessarily have been by the severe and protracted headache. All the mental deterioration has come on quite recently, and since the changes in the motor system have appeared. Cerebral tumor almost invariably leaves the intellect unaffected until comparatively late in the course of the disease.

Why is the mind so tardily affected by cerebral tumor? In the progressive growth of a cerebral tumor there is but little alteration taking place in the superficial portion of the brain where intellection is supposed to reside. It is not until the tumor has attained a considerable size, that a pressure is set up which so interferes with the blood-supply of the brain as to produce first, cerebral anæmia, then innutrition, and finally softening of the brain substance. In local softening of the brain, there is a progressive obscuration of mental power, but in cerebral tumor, I repeat, the softening only takes place in the last stages of the disease, when the tumor has reached such a size as to seriously interfere with the cerebral blood supply.

I can look at this case in no other light than as one of cerebral tumor. The characteristic combination of the symptoms allows of no other diagnosis to my mind.

You will ask me, perhaps, are there any symptoms wanting to render your diagnosis more conclusive? I will answer you candidly. There is more than one characteristic symptom of cerebral tumor wanting. There is no local paralysis of the muscles of the face noticeable here. This is a very usual condition in most cases of cerebral tumor, and yet I can as truthfully say that the absence of this paralysis does not invalidate my conclusion. Another common symptom of cerebral tumor is persistent vomiting. As I have already told you, there was vomiting early in this case, but it has almost entirely passed away. Still, my diagnosis is not upset. And why? Simply because vomiting is the result of a tumor seated in a certain spot, *i. e.*, a tumor which presses upon the origin of the pneumogastric nerve. This tumor evidently does not press upon the origin of the pneumogastric nerve, and so, very naturally, we have little, or no vomiting in this case. This fact, viz., the absence of vomiting, will give us some clew in settling upon the exact site of the tumor. But we shall come to the consideration of this point hereafter.

Is any other disease possible in the present instance? There are two other diseases possible, but I do not believe in the existence of either of them in this man, and I will tell you why. This might possibly be a case (1) of chronic meningitis with thickening, or (2) a case of diffused softening. Let us consider the chronic meningitis first. The symptoms of this disease are spasmodic contractions, persistent headache and vomiting. We have, in truth, in chronic meningitis symptoms very similar to those of cerebral tumor. But consider this point—the acute origin of this case—the inception of the symptoms dating from exposure and debauch. *I have drawn your attention to*

this statement to tell you that meningitis may begin in just this way. In meningitis, however, there is always more or less fever. Here there has been none to speak of. In meningitis, especially when it has an acute beginning, mental aberration is one of the earliest symptoms. Here it has been one of the latest. The steady, progressive course of the disease in this man from worse to worse, uninfluenced by treatment, is against the assumption that the case is one of chronic meningitis with exudation and thickening, for that disease can, in the generality of instances, be very materially relieved, if not altogether cured, by the proper treatment.

I have come across one symptom in this case which does not belong to the history of cerebral tumor. This case had an acute beginning. *Acute beginning —how do I explain that away?* There are some cases in which a tumor seems to explode in its symptoms. There is a sudden development of acute symptoms in the gradual course of the disease. Such an acute development I take to have happened in this case.

But again; this case might conceivably be one of cerebral softening. Why do I think that such is not the fact here? Cerebral softening very rarely occurs before middle-life, unless there be a specific, definite cause, such as disease of the heart or of the blood-vessels. As a celebrated modern writer on this subject has put it, "we have no knowledge of cerebral softening without cerebral embolism." This is a strong statement, but, as a general thing, will be found to be true. Again, cerebral softening, when existing to such an extent as to impair motion so greatly, would have to be of a very diffused character. If it were of so diffuse a nature, the intellect could not remain intact near so long a time as it has in the case of this man. Changes and disorders of intellect are among the first signs of cerebral softening. These disturbances of intellection appear long before the asthenia, and general palsy. This is a strong point of diagnosis. As regards the spastic contractions also, it is well known that they are not among the symptoms of cerebral softening. Spasms belong peculiarly to tumors and meningitis. So markedly do they belong to cerebral tumors, that we very frequently find them assuming the shape of general convulsions, though no convulsions have occurred in this instance. Having now narrowed the possibilities of the diagnosis down to one definite reality, there are still two other points which must needs be settled. (1) What is the character of the tumor? (2) Where is it situated?

As regards the answer to the first of these questions, I can only plead entire ignorance. It is a simple impossibility to recognize the character of a cerebral tumor without an autopsy. Nor is it of any practical consequence that we should recognize it, except in so far as to knowing whether or not it is syphilitic in its nature. The question as to whether it be a sarcoma, or a glyoma, or a cancer, may be of great interest to the pathologist, but it is a point of no practical value to the clinician. Here the history of the case favors the view of its syphilitic nature. Against this view, however, must be set the fact that persistent anti-syphilitic treatment has had no influence whatsoever upon it. We have been long using large doses of the iodide of potassium without the least effect. The evidence to be drawn from the results of anti-syphilitic treatment is therefore against the syphilitic origin of the tumor. Where there is an hereditary history of cancerous diathesis, the tumor is very apt to be a cancer. Here we know nothing definitely with regard to the nature of the growth, nor is it necessary that we should know anything definite about it.

As regards the probable position of the tumor, I think I can give a far more accurate answer. I should say that the tumor was located at or near the base of the brain, that it probably sprang from the tentorium, and that it compressed the motor tracts of the cord at or near their point of decussation. I say this, because this patient suffers from such excessive asthenia on both sides of his body. If the tumor were situated in any other centre of motor power, it would have to be large enough to affect both of the corpora striata. It lies, therefore, not in the motor ganglia proper, but at the origin of the spinal cord. The marked choking of the discs of the eyes rather favors this view. The only fact to be mentioned against such a possible site is the absence of vomiting. This can be explained very easily by the supposition that the tumor does not press upon the origin of the pneumogastric nerve. There would probably be just the same class of symptoms as we note here if the tumor were situated in the cerebellum. I have made the endeavor to discover if there was any loss in the power of co-ordinated movement, but owing to the condition of the patient the examination had to be given up. I do not believe that the tumor involves the cerebellum, though it is quite possible. There is always a source of fallacy in trying to fix the exact site of a cerebral tumor. For, as Brown-Séquard has shown, the symptoms of reflex irritations of other parts of the brain may be mistaken for those produced by the tumor.

The prognosis of cerebral tumor is generally extremely unfavorable. If it is quite clear that the tumor is of syphilitic origin, there is a good chance of cure by the use of mercury and iodide of potassium. This poor man has no chance whatsoever of recovery. All treatment has completely failed. He will certainly die, and that quite soon.

Our treatment of this patient has been based upon the idea that the tumor was of syphilitic origin. We have given large doses of the iodide of potassium; at first fifteen grains, thrice daily, and lately as much as thirty grains, four times a day. For the last four weeks the man has been taking ʒ ij. of the iodide daily without any improvement. To remedy the cerebral congestion, I have ordered blisters and other counter-irritants to be applied to the nape of the neck.

To relieve the excruciating and constant headache, I tried the bromide of potassium, and gelseminum, both without any effect, and then resorted to local venesection. This always afforded relief. Thus I have taken from two to five ounces of blood from the patient, opening a vein near the mastoid process, or in the nape of the neck whenever the headache was very bad. I am convinced that, in such cases as this, the local abstraction of blood affords more relief than can be obtained by the use of any internal remedy.

Up to within the past week or two, I have been able to control the patient's restlessness by means of large doses of the bromide of potassium and cannabis indica. The time has come, however, when the man's terrible distress and constant restlessness have become so uncontrollable, that the hypodermic injection of morphia is the only means of giving the poor fellow peace. This I do to produce euthanasia. Why should we refrain from giving opium even if there is a chance of its producing cerebral congestion in such a case? Why not let the patient have all the comfort possible in the terrible closing hours of such a disease as this?

SYPHILITIC MENINGITIS—GUMMY TUMOR.

I. H., 36 years of age. Had syphilis many years ago, but not in an unmistakable form, since the only symptom following the chancre was persistent headache. As this did not come on until several years after the sore had healed, it is doubtful whether there was any connection between the two. The patient lately has had perfect health until about two weeks ago when the headache returned. He was admitted on January 19th. On January 12th he first felt the headache and pain. These were most marked in the ball of the right eye. At about the same time the right upper eyelid began to droop. The vision of the right eye was also interfered with; he saw double at times, and occasionally his sight was blurred. The pain in his head is always intensified at night. There is no albumen in the urine, no heart disease, in fact no organic disease of any kind.

Let me carefully examine the case with you. What strikes me most markedly is the droop of the right upper eyelid. This droop prevents the eye from being completely opened. There is evidently paralysis of the right upper eyelid. The right lower eyelid is not affected. Upon examining the eyes intently I find some disparity in size between the pupils, the right being smaller than the left. There is no loss of power, however, in the right eye of adapting itself to the varying intensity of light. With regard to the pain it is chiefly felt deep in the ball of the eye. It is not limited to that spot, however, but is occasionally referred to a point behind the ear. The pain is not increased by pressure, and there is no obvious swelling of the bone, nor is the pain increased by moving the muscles of the scalp.

In testing (1) the muscles of each side of the face I find no loss of power on the right side; in testing (2) the eye muscles I am struck with the fact that the patient cannot readily turn the right eye in—there is, therefore, slight palsy of the internal rectus. The right external rectus is also somewhat defective in power. In testing (3) the eyes themselves the right retina was found to be slightly congested, there was, however, no choking of the disc.

As regards sensation there is far greater sensitiveness on the right side of the face than on the left. The power of taste seems to be about the same at the two sides of the mouth. As regards the hearing, there is a very great difference between the two ears. The patient can scarcely hear the ticking of a watch held only one inch from the right ear, while he can hear it plainly six or seven inches from the left ear.

I also find that the power of grasp of the right hand is weaker than that of the left. There is no appreciable difference in the gait, or muscular power of the two legs. Testing the muscles by electricity shows that the contractile powers of the muscles of both sides of the body are equally well preserved.

What is the matter with the man? The headache is evidently unassociated with disease of the bones. It is certainly a very instructive case. What is its anatomical analysis? Which nerves are paralyzed? By reason of the affection of the right eyelid and retina the third nerve of the right side must be more or less paralyzed. So, too, as regards the sixth nerve. As there is marked hyperæsthesia of the right side of the face the fifth nerve must also be involved. The difference in the powers of hearing of the two ears shows that there is something the matter also with the portio mollis of the auditory nerve. If there is this disturbance of these nerves there must be some source of irritation.

Taking all these points into consideration, I should say that the lesion was low down on the right side in the vicinity of the pons. No other explanation is sufficient to account for the symptoms. I should also say that the lesion must press upon the spinal nerves below their point of decussation. I think that the lesion is probably a gummous mass, the result of an exudation. No sudden lesion other than a gummous mass would explain the rapid development of headache, palsy, and general right-sided weakness.

The man tells us that about a year ago he had an attack very much like this, and that it disappeared entirely under treatment. I can imagine a slowly growing tumor in this case also, but then that would not have allowed the man the past year of perfect immunity which he has had. In that case there would have been spasm. Could it be a case of simple, unspecific, local meningitis? We never have local meningitis without some direct cause, such as a blow or injury. There is no history of such a cause here. Again, there is always fever in local meningitis, usually accompanied by nocturnal delirium. These symptoms are all absent here. There has not been any aberration of intellect in this man.

As regards treatment, blisters have been applied behind the patient's right ear and at the nape of his neck. Occasionally he has been purged. I have also put him upon large doses of the iodide of potassium, at first twenty grains three times a day. Later this amount was doubled and I steadily kept on increasing the dose until now he is taking 3 i. four times a day. The chances of cure are excellent. If the headache is too severe at any time I will order the administration of half a drachm of the bromide of potassium. I will rather trust, however, to the local impression made by the general remedy.

CEREBRAL CONGESTION, A RESULT OF SYPHILITIC ARTERITIS.

L. H., 26 years of age, a sailor, has had distinct syphilitic disease, which was followed by papular eruption and falling out of hair. Was admitted on January 17th. On the morning of January 14th he woke up to find some difficulty in his speech; was unable to articulate distinctly. He also noticed a loss of power in the right side of his body. This was not, however, bad enough to keep him from his work. There was a little later quite marked loss of power in the right arm and right side of the face. He had regained the power in his arm when admitted to the hospital. You see to-day that there is still some slight difference in the two sides of the face. The right eyelid is moved less readily than the left. The facial palsy, however, has also largely disappeared. Both of the retinas are congested, but there is no choking. There is slight deafness on the right side. As regards his power of speech, though largely regained, there is still some difficulty in the remembrance of words. He has that form of aphasia in which one's vocabulary is very limited. He is suffering still from headache and giddiness.

What is the disease? you will ask. There has been present either one of two conditions. There has been either marked congestion of the left anterior cerebral lobes, or there has been cerebral embolism. Why do I not talk of apoplexy as a possible explanation? Simply because the man has not lost consciousness once since the beginning of the attack. The course of the palsy has also been too rapid for apoplexy.

I believe it to be a case of congestion rather than of embolism, and why? The man has no heart disease, and embolism is generally a result of heart disease.

It is barely possible that embolism might occur during the course of syphilitic degeneration of the arteries, but this is very unusual.

Why do I say that there has been congestion of the anterior convolutions? Because clinical experience has taught that the occurrence of right-sided palsy with aphasia points to a lesion of the left anterior lobes. Physiology teaches us that it is there that the organs of articulate speech reside, particularly in the third convolution.

You see how much improvement the man has made. I think he will recover entirely under the use of purgatives and mercurials. He has been taking large doses of iodide of potassium. It is needless to say that the underlying syphilitic poison, causing degeneration of the cerebral arterioles, has been at the bottom of this attack.

Original Communications.

CONCERNING PULSATILLA AND OTHER MATTERS.

By HENRY G. PIFFARD, M.D.,

SURGEON TO THE CHARITY HOSPITAL, ETC.

BOTANICAL. — The natural order RANUNCULACEÆ furnishes many of the most active (*i. e.*, poisonous) of the vegetable substances that are employed in medicine; as aconite, belladonna, etc., together with the subject of this sketch.

Among the RANUNCULACEÆ, we find the tribe ANEMONEÆ, which embraces five genera, including the genus *Anemone*. This latter alone concerns us at present. It comprises several varieties prevalent in Europe and the United States, and those of medical interest are as follows:

	Synonyms.
Anemone Pulsatilla, " Pratensis,	Pulsatilla Nigricans,
" Nemorosa,	
" Ludoviciana,	Pulsatilla Nuttaliana.

The *A. puls.* and *A. pratens.* are European plants, and differ little from each other morphologically, and are supposed to possess identical physiological and therapeutical properties, and in foreign pharmacopœias are frequently confounded under the general name of pulsatilla. The *A. Nemorosa* is both European and American, but is not employed to any extent as a therapeutic agent. The *A. Ludoviciana* is an American plant.

Prof. Lee, formerly editor of the New York *Journal of Medicine*, says* that there are five varieties of Anemone in this State, among which is the *A. Nemorosa*. The *A. puls.*, *A. pratens.*, and *A. Ludov.* are not mentioned. He adds "that the medicinal properties of *Anemone* are similar to those of the *Clematis*, only more active. The *Nemorosa* acts as a poison to cattle, producing bloody urine and convulsions. An ointment of it speedily cures *Tinea capitis*. In the recent state, most of the species are acrid and rubefacient."

Historical.—Some of the varieties of anemone were known and employed in medicine in very early times. Of the earlier writers who speak of it, Galen (about A.D. 175), Paulus Ægineta (A.D. 675), and Avicenna (A.D. 1050), may be mentioned.

GALEN * says of anemone: "Radix commansa pituitam evocat. Succus e naribus purgat, et oculorum cicatrices extenuat. Insuper sordida ulcerum anemonæ expurgant, et lepras detrahunt, mensesque appositæ eliciunt, et lac trahunt."

PAULUS ÆGINETA † says: "Anemonæ omnes acres sunt, et abstergentis naturæ, evellentisque, et ora vasorum aperientis. Pituitam itaque evocant, et lepras detrahunt appositæ, lacque eliciunt."

AVICENNA ‡ says: "Est abstersiva, lavativa, attractiva, aperitiva, resolutiva. Denigrat capillos mista cum corticibus nucis, et quando administrantur folia ejus et stipites ipsius sicut sunt aut decocta bonificat capillos. Linitur ex decoctione ejus super apostemata, quæ non sunt dura, et fit evacuatio per eam super carbunculos et bothor calidas. Confert ulceribus sordidis et incarnat ea ex excoriatione, et ipsa mundificat ulcera, conferens excoriationibus et scabiei ulcerosæ. De ejus succo fit caputpurgium ad purgandum caput, et cerebrum, et ejus radix masticatur ad extrahendas humiditates a capite. Succus ejus confert tenebrositate oculi, et visus et albugini ejus et vestigiis ulcerum et quando decoquitur cum vino, et fit inde emplastrum, sanat apostemata dura in partibus oculi. Si coquantur folia ejus et stipites ejus cum sorbitionibus hordei et comedatur, facit abundare lac. Provocat menstrua."

From the foregoing it will be seen that the Anemone was esteemed in diseases of the eye and skin, in derangements of the menstrual function, and as a galactagogue. For some reason, however, the plant fell into disuse, and was almost forgotten until Störck revived it during the latter part of the last century. This writer § regarded it as one of the heroic medicines that had been unjustly neglected, and recommended its use in melancholy, amenorrhœa, severe forms of syphilis, and in certain diseases of the eyes, etc. The fame of the drug spread to England and France, but in the former country it retained for a short period only the dignity of an officinal preparation.

Cullen ‖ speaks of it as follows: "This is one of the remedies which we owe to the benevolent industry of Baron STÖRCK; but he has ascribed to it so many wonderful effects that his credit is hurt with many persons, and has made many neglect to give this remedy a frequent and fair trial. It has particularly concurred with this in Scotland that the plant is not a native of this country, and that there has not been ready access to it.¶ But whatever may become of the credit of Baron STÖRCK's experiments, I must observe that the plant is an acrid substance, and therefore capable of being active; and from the singular matter resembling camphire which water distilled from it contains, it may have peculiar powers and virtues.

"I would still recommend it to the attention of my countrymen, and particularly to a repetition of trials in that disease so frequently otherwise incurable, the amaurosis. The negative experiments of Bergius and others are not sufficient to discourage all trials, considering that the disease may depend upon different causes; some of which may yield to remedies, though others do not."

In Germany and France it gained and retains a place in the pharmacopœia, though but little used in

¶ The preparations used in Scotland were probably made from the dried herb.

practice. It has never, we believe, been officinal in this country. The successors of Störck failed to obtain the good results claimed by the latter, and the drug fell into disrepute in regular practice. Later Hahnemann made a "proving" of pulsatilla, and regarded it as a polychrest, and recommended it in a number of diseases, especially those which have already been mentioned. Among his followers it has retained its early reputation, for reasons that will presently be apparent.

Still later Rademacher * recommended it in nervous affections, headache, asthma, whooping-cough, amblyopia, amaurosis, etc. Rademacher used the same preparation as Hahnemann, namely, a tincture prepared "ex herba florescenti recenti," by mixing the expressed juice with an equal volume of alcohol (*op. cit.*, p. 243).

In England attempts have from time to time been made to revive the use of pulsatilla, but without success.

In this country comparatively little attention has been drawn to the drug, and but two articles concerning it have fallen under our notice. The earlier of these is by Mr. A. W. Miller (pharmacist), on the "*Anemone Ludoviciana*" (*Am. Jour. of Pharmacy*, vol. xxxiv., 1862). He says: "The many points of similitude between this plant and the European Anemone Pulsatilla, which were also noted by Nuttall, very naturally gave origin to the supposition, that in chemical composition and therapeutical effects they were also closely allied, if not identical. Numerous experiments, instituted by Dr. W. H. Miller, of St. Paul, Minnesota, with a view of verifying the latter surmise, proved to be entirely successful, and also served to establish the value of this remedy in many chronic diseases of the eye, particularly cataract, amaurosis, and opacity of the cornea. Very decided advantage was also experienced from its employment in cutaneous eruptions and secondary syphilis. These results, in conjunction with the investigation of its chemical constituents, are believed to be sufficient to warrant the substitution of this indigenous plant for the European *A. puls.*, which, though not often administered by regular practitioners, is very frequently resorted to by homœopathists.

"A tea of the dried flowers and herb was sometimes employed, as well as the juice of the fresh plant bruised and expressed, and then either preserved by the addition of one-fourth of its bulk of alcohol, or evaporated to the consistence of an extract. In preparing the latter, the presence of some volatile acrid principle was clearly manifest by the highly irritating vapors arising from the juice on the application of a gentle heat, producing a very painful impression on the eyes of the operator. That this volatile substance is also dissipated by drying is proved by the taste of the dry flowers, which is simply sweetish and herbaceous, that of the leaves being more astringent, with very slight acrimony, while in the recent state both are exceedingly irritating and acrid. The odor of the dried plant is faint, being slightly camphoraceous.

"As the preserved juice had not been subjected to the deteriorating influence of evaporation, it was supposed to contain the greatest amount of active principle. It was therefore most frequently administered, and the most marked effects of the drug were observed to follow from its use."

In the second article, Dr. J. C. Peters (*Bost. Med. and Surg. Jour.*, Aug. 29, 1867) gives the history of the drug, and compares its effects with those of Senega. He says: "Both remedies have been used successfully in catarrhal affections of the eyes, nose, ears, throat, air-tubes, gastro-intestinal and urinary organs."

Chemical.—The *A. pulsatilla*, like the *A. pratens.*, and probably several other *Ranunculaceæ*, owes its energetic action to a volatile crystallizable principle of neutral reaction, soluble in hot water and hot alcohol, from which it is deposited on cooling, and which has received the name of Anemonin. This is an acrid substance, and the melted crystals applied to the tongue produce a pricking and stinging sensation, and leave after them white spots like those caused by escharotics. The fresh plant possesses the same irritating, vesicating, and even caustic properties, but in consequence of the volatility of its active principle the desiccated plant is almost inert. Besides its local irritating action, anemonin doubtless produces general effects analogous to those of aconitine. This has not as yet been determined by physiological experiment (Gubler).*

The accepted formula for anemonin is $C^{15}H^{12}O^4$. When deposited from the distillate it forms colorless shining orthorhombic prisms, heavier than water. These are insoluble in cold, but slightly soluble in warm ether. They are more soluble in chloroform, and also in hot lavender and olive oils (Husemann).†

This active principle appears to have been first isolated in 1779, by Heyer, who employed it successfully in disease of the eye. Since then it has been used but little therapeutically (Reil).‡

Physiological.—Störck experimented with the plant on healthy persons, and has left the following observations concerning its effects:

"In lingua primo dolor, tum calor diutinus.
In brachio hinc inde dolores lancinantes.
In brachio nocturnus pruritus.
Menstruatio aucta.
In brachio vesiculæ, pure inde dein refertæ et squamis deciduæ.
Vomiturtio.
Eneuresis.
Sudor magnus, fœtidus, nocturnus.
Ardor urinæ molestus.
Materiæ aquosæ fœtidæ secessus ex urethrâ.
Oculi aquâ suffusi, lachrymis abundantes lippi.
Salivatio.
Dolor in oculi, quasi cultro radatur.
Lancinans in abdomine dolor.
Ardentes, lacerantes, vagi dolores a digitis pedum ad inguen usque.
Hæmorrhois fluida.
Tormina lacerantia.
Diarrhœa.
Eneuresis fere continua.
Diarrhœa non debilitans.
Dolores summi lacerantes, terebrantes secantes in oculi.
Menstruatio copiosa.
Purulenta excretio e nare sinistra."

Hahnemann§ quotes the foregoing and adds a large collection of symptoms said to have been produced by the drug. Some of them are doubtless reliable, while others (perhaps the majority) are accidental, illusory, and non-essential. The difficulty is to distinguish the former from the latter.

† Die Pflanzenstoffe. Berlin, 1871.
‡ Materia Medica der reinen chemischen Pflanzenstoffe. Berlin, 1857.
§ Frag. de vir. med. pos. Lips, 1805.

The effects of the active principle (anemonin) have been studied to a limited extent, chiefly by Clarus, who found that doses of 0.5 to 0.6 grm. causes death in rabbits. The plant paralyzes the medulla oblongata and spinal cord, and excites irritation of the digestive tract and the kidneys.*

Pharmaceutical.—A variety of preparations of pulsatilla have been employed. Beside the expressed juice preserved in alcohol (*i. e.*, tincture) and the *distilled water*, the drug has been given in powder, in decoction (tea), and in aqueous and an alcoholic extract. The latter is officinal in the *Pharm. Germanica.* The *Codex* (French Pharmacop.) mentions the plant, but does not give any rules for its preparation. In this country most wholesale druggists offer for sale a "fluid extract."

The extract of the Germ. Pharm. is prepared from the fresh plant *with the aid of heat*, and the "fluid extracts" from the *dry* herb. Insomuch as the active principle of the various anemones is volatile, and is dissipated by heat and desiccation, we can only expect to find it in the tincture or distilled water made from the fresh plant. Modern pharmacy has abandoned these preparations, and only offers us (thanks to the pharmacopœia makers) extracts and fluid extracts that are decidedly unreliable and comparatively inert.

This explains why it is that the ancients, as well as Störck, Hahnemann, and Rademacher, found pulsatilla an active and useful remedy, while so many others (using inert preparations) have failed to obtain the effects ascribed to it by the former.†

Therapeutical Uses.—There appears to be a remarkable uniformity of opinion as to the sphere of usefulness occupied by the drug under consideration. Its successes have been mainly obtained in certain affections of the eyes, including some of those vaguely expressed by the term amaurosis, in certain diseases of the nervous system, in affections of the generative system, and of the stomach and skin. In the two latter classes of disease, it is probable that its effects are local, while in the others it is not unreasonable to suppose that they may be due to some specific affinity for the organs interested.

Personal Experience.—Our own experience with pulsatilla is confined to the treatment of three cases of dysmenorrhœa and several cases of epididymitis. These we will briefly relate.

DYSMENORRHŒA COMPLICATING ACNE.

A. B., 17 years old, came under our care Nov. 24, 1876, for acne simplex of four years' standing. For several years has had disturbed menstruation, the periods not being equidistant and always preceded by severe pain, and often by hysterical attacks with slight convulsions. She has also profuse leucorrhœa continuing through the month. Treatment appropriate to her acne, together with tonics, was instituted.

Dec. 26th.—Ordered tinct. of pulsatil. nuttal., two drops in water, an hour before meals. To commence its use three days before she expected her menses, and to discontinue it when any appeared.

Jan. 5th.—Has menstruated since last visit, absolutely without pain or inconvenience. Continue pulsatilla twice daily.

Jan. 12th.—Her leucorrhœa is less troublesome. Continue pulsatilla once a day.

Jan. 25th.—Has again menstruated without pain, but flowed for two days only.

April 28th.—No dysmenorrhœa since last date. Have not seen her since. As the special treatment for her acne has no bearing upon the point under consideration, it is unnecessary to detail it.

DYSMENORRHŒA COMPLICATING ECZEMA.

C. D., 28 years old, married, came under my care March 12, 1877. Her eczema was of the dry, papular variety, situated chiefly about the mouth. For several years has suffered intensely at her monthly periods, the flow being scanty, and not lasting more than twenty-four hours. Leucorrhœa moderate. Treatment ordered for the eczema only.

March 30th.—Continued local and internal treatment for the eczema, and ordered her to take two drops of tinct. pulsatil. nuttal. for two days preceding her periods.

May 8th.—Returned to-day and says that she took the pulsatilla as ordered, and that she did not suffer at all at her next period. After that she lost her medicine and did not take any before her last menstruation, which was last week. On this occasion she had a little but not much pain. She was re-supplied with the medicine.

Dec. 31st.—Saw her to-day. There has been no return of dysmenorrhœa, but her periods anticipate, and her general health is not good. Advised her to consult a gynecologist or general practitioner.

DYSMENORRHŒA AND ECZEMA.

E. F., aged about 40, unmarried, came under treatment Feb. 13, 1877. Eczema of three, and dysmenorrhœa of several years' standing. Pulsatilla, employed as in the other cases, failed to afford any relief whatever.

In the foregoing cases no vaginal examination was made, and it is of course impossible to state what the underlying pathological cause of the trouble may have been. I simply state facts as observed. Being neither a general practitioner nor a gynecologist, I leave the further investigation of this application of the remedy to those who have proper facilities for carrying it on.

EPIDIDYMITIS.

On resuming charge of my service at the Charity Hospital in April last, I resolved to test the efficacy of pulsatilla in gonorrhœal epididymitis. The first case treated was in the early acute stage and in an advancing condition. To this one tinct. pulsatilla nigricans was given in five-drop doses every two or three hours. This medication was followed by rapid increase of the pain and swelling, and after forty-eight hours the pulsatilla was abandoned and tobacco poultices substituted. The second case, also acute and advancing, was treated in the same way and with the same result. The third case had already, on admission, passed the height of the disease and was declining. Pulsatilla, in two-drop doses, appeared to influence the case but little one way or the other. The succeeding cases, seven or eight in number, were treated with pulsatilla in doses not exceeding $\frac{1}{10}$ of a minim well diluted, and administered as a rule every one, two, or three hours, according to circumstances. In these cases an almost immediate improvement was manifest. The pain began to subside within a few hours, and was

* Binz: Elements of Therapeutics, Am. Ed., N. Y., 1878, p. 24.

† The substitution in modern pharmacy of comparatively worthless for older and more active and reliable preparations can be illustrated by numerous examples taken from the French, German, English, and U. S. Pharmacopœias, and explains the decadence of many drugs which were formerly held in high esteem. It need not be a matter of surprise, then, that an effort was recently made, by those acquainted with the facts, to give the subject of the U. S. Pharmacopœia a thorough overhauling; an effort which, we regret to say, was defeated by the representatives of the medical profession who assembled in Chicago last June.

almost entirely gone in from twenty-four to forty-eight hours. In advancing cases the tumefaction came to a standstill coincident with the diminution of the pain, after which it gradually subsided. The cases ultimately recovered in fully one-third less time than I have ever seen by other treatment. During the use of the pulsatilla, poultices and all other remedial measures except support of the parts was avoided. The patients were permitted to remain in bed or to be up and about the ward as they chose. The last case that I report was in my private practice: X. Y., aged 34, called at my office July 19th, with commencing epididymitis following a gonorrhœa contracted a month previous. Has had gonorrhœa twice before, and "swelled testicle" once which laid him up for ten days. At the time of his visit I was myself confined to bed by illness, but ordered him to take three triplex pills, a sitz-bath, and to go to bed, and to inform me by note of his condition the next morning. July 20th, he writes: "I have been in bed all day and had three sitz-baths, but find that the swelling does not seem to go down." Sent him some pulsatilla, with directions to take a dose every three hours. July 21st, he writes that he is much better; the pain and swelling have almost entirely subsided, but that there have been two or three slight hemorrhages* from the urethra. As I was still unable to leave my own bed, requested Dr. G. H. Fox to visit Mr. X. Y. and learn the state of affairs. Dr. F. did so, and reported that the hemorrhages were insignificant and that the epididymitis was substantially well, and that no further treatment was required.

Conclusion.—Pulsatilla appears to the writer to be worthy of further trial. It is requisite, however, that the tincture of the fresh plant, or its active principle, should alone be used. The preparation that I employed exhibited the chlorophyl bands distinctly when examined with the spectroscope. The dose of anemonin is 1 mg. (gr. $\frac{1}{65}$) according to Gubler (*op. cit.*).

Addendum.—One of the most important questions before the profession at the present time is the next revision of the U.S. Pharmacopœia. The neglect with which this subject was treated by the American Medical Association at its last meeting is to be greatly deplored, as the probable result will be that the matter will be practically left in the hands of the druggists. The American Pharmaceutical Association have already appointed a committee to prepare a new pharmacopœia, which will probably be constructed in the interests of those who make it. These interests are far from being identical with those of the medical profession. At a recent meeting of the committee above referred to, it struck off from a list of proposed additions to the pharmacopœia a number of drugs, including pulsatilla, chelidonium. The only one of them besides pulsatilla with which I have had practical experience is chelidonium. This appears to act specifically on the liver, and in many cases is preferable to podophyllum, being less violent in its action. It was formerly held in high repute, but, like pulsatilla, its active principle is volatile, and the only officinal preparation of it is an extract (Ph. G.) prepared by heat. No wonder that physicians have long since abandoned its use. The pharmacopœia needs fewer *extracts* and *fluid extracts*, and more *succi*, the only representative of this class being the succus conii. The British Pharmacopœia contains, in addition, *suc.* limonis, mori, rhamni, scoparii, and taraxaci. The three former are preserved with sugar, the two latter with alcohol. The formulæ for these could, I think, be modified to advantage by increasing the proportion of spirit in order to insure better preservation. Commercial interests, however, will probably stand in the way of an extended list of *succi*.

As success in treatment depends so much on the quality of the drug employed, it is certainly time that the profession as a whole gave some consideration to the matter, for they may rest assured that if they fail to look after their own interests they can hardly expect others to do it for them. The lack of appreciation that was shown at the Chicago meeting augurs ill for the future.

Postscript.—Since the foregoing was written, I have met with an article by Prof. Chas. A. Lee, M.D. (already mentioned), published in *The Journal of Materia Medica*, March, 1859, and bearing the following title: "Remarks on Some of the Pharmaceutic Preparations Employed in Medicine, especially of Solid and Fluid Extracts." The article in question is so thoroughly *en rapport* with what I have just written, that I take the liberty of quoting a few paragraphs:

"The uncertainty of medicine has been vastly increased in modern times by the varying qualities or even inert nature of the medicines administered. Medical art has, in innumerable instances, been held responsible for results of which it was wholly innocent, and for failures entirely unexpected. To this cause, much of the scepticism, both in and out of the profession, regarding the curative properties of drugs, is owing; so that many of the educated and intelligent class have come to believe that there is no art and science of medicine; that it is far preferable to trust to nature or homœopathy than to rational medicine for a cure. . . . It is not to be supposed that medicine can ever arrive at that certainty which we meet with in some of the other sciences. Still, much will be accomplished towards this end if we can only obtain medicines of uniform strength and purity. Is this possible at the present time? Are the drugs now in our market, either in their crude state or as products of the pharmaceutic art, generally reliable in the treatment of disease? Is sufficient attention paid to the circumstances which are likely to cause a deterioration in their quality, etc.?

"When we consider the present relaxation in the enforcement of our drug inspection laws in the port of New York; the consequent extensive importation of spurious and sophisticated drugs;* their frequent adulteration in the home market; the frauds of the drug-grinders and the wholesale and retail dealers, as well as the imperfect and unscientific means of preparation adopted by many manufacturers, we shall no longer wonder that medicine is regarded as a very uncertain science, and still more uncertain in its practical applications for the relief of the sick.

"And yet the case is not hopeless, nor is the physician unable to obtain reliable medicines if he will use the necessary care, and is willing to pay the necessary expense."† Dr. Lee then goes on to say that there are yet to be found "wholesale dealers, who have a

* Compare Dr. Lee's statement concerning the effects of *A. nemorosa* (*vide supra*). I subsequently ascertained that this patient was subject to hemorrhage on the slightest occasion.

* From *New Remedies*, Jan., 1878, we learn that the only drugs refused entry at the port of New York, during the past year, 1877, were the following: Gum guiac, 42 boxes, 29 cases, 1 barrel; balsam copaiba, 25 drums, 7 barrels; jalap, 11 bales; squills, 3 bales; rhubarb, 5 cases; assafœtida, 4 cases; Iceland moss, 3 bales; hellebore root, 1 bale." Surely this is a paltry list of rejections, compared with the vast quantities of drugs yearly imported, and explains why Dr. Squibb is obliged to write in his last Price Current: "But to obtain good drugs, even at high prices, from which to prepare fluid extracts, becomes more and more difficult."

† The market value of the tincture of pulsatilla used in the beforementioned experiments is $3 per pound; fluid extracts of pulsatilla, however (having twice the *nominal* strength of this tincture), abound in the market at $1.25 per pound.

laudable pride in sustaining the credit of their establishments, who use every precaution to keep none but the purest drugs. . . . Such dealers know of but one quality of drugs, and that is the *best*, while others can supply all kinds to suit the pockets and wishes of customers."

Dr. Lee's remarks are pertinent, I think, to the present time, as I find on consulting the general prices current of several prominent drug-houses that aconite, belladonna, conium, and digitalis leaves are offered at from $0.15 to $1.25, and hyoscyamus leaves at from $0.25 to $2.50 per pound.

Dr. Lee's entire article can be perused with profit. It is to be regretted, however, that the master-mind that conceived it is now no more.*

In closing, we ask, Have the matters herein referred to improved or retrograded during the past twenty years? This question can be best answered by those whose experience extends back through the last quarter of a century, and we trust that the appeal to them will not be in vain.

MODIFICATION OF POLITZER'S METHOD OF INFLATION.

By J. OSCROFT TANSLEY, M.D.,

ASSISTANT SURGEON TO MANHATTAN EYE AND EAR HOSPITAL, AND VISITING SURGEON TO NORTHEASTERN DISPENSARY, DEPARTMENT OF EYE, EAR, AND THROAT.

In a "Report on Otology," read by my friend, Dr. E. E. Holt, before the Maine Medical Association, June, 1877, are these words:

"Various modifications of Politzer's method have been suggested, to do away with the necessity of swallowing water, but they generally have been no easier of execution than the original method. For some time I have been using a method that does away with the swallowing process. I found, by taking a full inspiration, and filling my mouth and throat tensely with air, and then discharging the air-bag, as in Politzer's method, that air readily entered the tympanum."

Acting upon the doctor's suggestion, I have adopted this process at my clinics at the Manhattan Eye and Ear Hospital, and at the Northeastern Dispensary, also in my private practice; and having now used it daily for the past five months upon a large number of patients, I can testify to the fact that I have found it much more pleasant to my patients, and certainly more effective than the old plan, and during the time of trial I have met but one patient whom I have failed to inflate; and in several cases where the swallowing process failed, I succeeded easily with the modification.

At first I followed Dr. Holt's suggestion implicitly, and had my patients fill their mouths and throats tensely with air, but I have succeeded better by telling them simply to pucker up their lips, and blow from their mouths in the same way as they would to blow out a candle, and at the same time refrain from letting air pass through their noses. Then placing the nozzle of the air-douche in the nostril, and retaining it *in situ* with the thumb and first finger, I, at the moment of Politzering, close the other nostril with the second finger, and usually succeed at the first attempt.

I prefer this method because it is more rapid and easier accomplished, and because I have more time to act; for when using water it is necessary to press the bag at the right instant; if too soon, then the velum has not closed the posterior passage, and if too late, the velum has regained its flaccid condition. In the modification there is all the time—during which the Politzeration may be accomplished—that it takes to empty the lungs by blowing through the lips. I find it convenient to gauge the power of any inflation by having my patient blow soft or hard according to the necessities of the case; for of course the stronger they blow the more tightly is the posterior passage closed.

My patients prefer it because they have not to swallow water which their wants do not at the time require. I have often, when using the old method, had to send patients away from my office or clinic, or use the catheter—and this latter is not always convenient—without having accomplished my object, simply because I had, in my attempts, filled them so full of air and water that they felt unpleasant. This method also avoids the disagreeable, and sometimes severe pain, which the old plan occasionally causes, in the muscles of the neck and chest of anæmic, and phthisical patients; produced, I have reason to suppose, by the Politzerization catching the muscles during their performance of, and thus interfering with, the act of deglutition. I have had, already, several instances of the avoidance of this pain, and am now treating a patient who has previously refused treatment because of this objection to the swallowing process.

For children it is much more convenient, because it is easy to have them blow from their mouths, but difficult to retain water in their mouths, and have them swallow upon your giving the signal.

* Oblit Feb. 14, 1872, æt. 71.

POSSIBLE CASE OF IDIOPATHIC RUPTURE OF STOMACH.

By JOHN H. ARTON, M.D.,

ISLAND OF BERMUDA.

I was called on the morning of the 22d Dec., 1877, to see a colored man named Watts, who was suffering from tympanites.

He was over fifty years of age, and had never had a day's sickness in his life, except previous attacks of the same kind as that from which he now suffered. On those occasions he attributed his trouble to some indiscretion in diet, but this time nothing of the sort existed. He had been a pretty hard drinker.

I prescribed pills of assafœtida, with injections of "milk of assafœtida," and in a few hours he was relieved.

Again on the afternoon of the 26th I was called, as he was again seized. I found him much worse this time, and his abdominal muscles were so distended as to be perfectly paralyzed, and therefore incapable of expelling flatus.

As he could get no relief, I plunged the largest aspirator needle I had into his abdomen, and gave vent to a gale heavily laden with the odors of assafœtida. This relieved him, and I went home, only, however, to be recalled in a few hours by a messenger, who reported that he had again swelled up, and that something had "gone off" inside of him like a pistol, audible in the adjoining room. When I arrived, I found the man suffering agonies, and, as I found the percussion over the liver tympanitic, I concluded something had given way inside, and that euthanasia was all I could obtain for him. This I did by means of my hypodermic syringe. Death took place five hours after the report.

Post-mortem examination sixteen hours after death.—Rigor mortis not well marked. Emphysematous crackling obtainable all over thorax. Right inguinal hernia. Abdomen immensely distended; on incising it down to the peritoneum, that membrane ballooned through the opening, showing evidences of inflamma-

tion. This allowed much gas to escape, the stench being horrible. The cavity was two-thirds full of reddish serum. The stomach had burst, showing a slit four inches long on its posterior aspect. The gall-bladder was very much distended, and its coats hypertrophied. It contained over two quarts of inspissated bile. The hernia consisted of small intestine alone; it was not strangulated. At the splenic flexure of the colon a stricture was found five inches long. The walls of the stricture were over one-fourth inch thick, and the calibre of the gut about one-fourth inch in diameter. It was much dilated *above* the stricture. The liver was small and dry. The spleen was two inches by one inch and a half, and about half an inch thick. The gastro-splenic omentum resembled a piece of rope, or rather, it was not unlike the umbilical cord. The vessels, etc., could not be demonstrated as such by the naked eye. Kidneys not examined. Thorax not opened.

Such is the result of a hasty examination. Gray speaks of senile atrophy of spleen, but surely this was not such a case. The patient had always been well, showing no symptoms of the loss of this organ. Did the stricture cause the tympanitis? It had not produced constipation. I know the hernia had nothing to do with it, for I reduced it when I first saw him, and at the autopsy nothing like strangulation appeared. He never vomited, nor complained of pain proper until after rupture.

Progress of Medical Science.

Division of the Tendo Achillis in Fracture of the Lower End of the Femur.—In fracture of the lower third of the femur Dr. M. A. Morris, of Harvard, Charlestown, claims that the tendency of the lower fragment to tilt backward into the popliteal space is caused by the contractions of the muscles arising from the condyles of the femur, and is exaggerated by the forced extension which is so very generally employed in the treatment of these fractures. Dr. Morris overcame this tendency to displacement by division of the tendo achillis, as recommended by Mr. Bryant in his work on surgery. In this case the fracture was situated about two inches and a half or three inches above the articular extremity, its direction being upwards and backwards; there was also a longitudinal fracture separating the condyles, which were freely movable. When extension was made, the upper extremities of the lower fragments projected backwards, and could not be kept in position. Judging that this was caused in great part by action of the gastrocnemius muscle, it was proposed to divide the tendo achillis. The operation was accordingly performed, and the deformity did not recur. The case was then treated in the ordinary manner, and the patient made a good recovery. The advantages claimed are, that it renders possible a better position, thereby accelerating union, and it lessens the liability to shortening, protracted confinement to bed, and anchylosis.—*The Boston Medical and Surgical Journal*, November.

A Case of Excision of the Human Spleen for Hypertrophy.—Dr. G. B. Simmons read before the Sacramento Society for Medical Improvement, an account of the first case of splecnotomy reported in America. In searching the literature of this operation, he finds but fifteen cases; the first was by Zaccarelli in 1544, and was said to have been successful. Since then there have been but two successful cases, both of which were operated upon by M. Pean, of France. The patient on whom Dr. Simmons operated was under observation for nearly three years, but during this time the progressive growth of the tumor seemed to be in no way affected by any of the many plans of treatment which had been suggested and tried. At this time he demanded operative interference, and spleenotomy was accordingly performed on the sixth of June, 1877. The incision was made in the abdominal wall near the linea alba, from four inches above to four inches below the umbilicus. There was some fluid in the abdominal cavity, and some recent adhesions to the intestine which were slowly separated, and the bleeding points secured by fine, carbolized ligatures. The organ was then turned out, and strong adhesions to the diaphragm were found, which occasioned some difficulty. The pedicle and gastro-splenic omentum, including the larger vessels, were ligatured in sections; the ligatures cut close and returned. The final removal of the organ was effected without allowing any blood from the incised splenic vessels to enter the cavity. The ascitic fluid was sponged out, and, as there seemed to be some slight oozing, a drainage-tube was inserted into the lower end of the wound, the incision closed by sutures, and dressings applied as usual after abdominal section. He recovered well from the effects of the ether, but soon began to retch and vomit, and these efforts were followed by flow of bloody fluid through the tube. In spite of all endeavors, he gradually sank, and died from hemorrhage two hours and a half after the completion of the operation. No post-mortem was obtained.—*Pacific Medical and Surgical Journal*, Dec., 1877.

The Musculus Choroideæ.—With the object of examining the separate cells forming the capillary vessels of the choroid, Drs. Hällsten and Tigerstedt injected a one per cent. solution of nitrate of silver into the vessels of the eye of a rabbit, through the carotids. To obtain the transudation of this solution, and thus a more complete impregnation of the silver, they filled the vessels completely with the fluid, using considerable pressure, and allowed the preparation to remain for 24 hours in a dark room. The choroid was then submitted to the ordinary methods of examination. They were thus enabled to define the limits of the endothelial cells which form the lining of the capillary vessels of the choroid, and to demonstrate, in opposition to Eberth (Stricker's Histology, p. 208), that these vessels are composed of cells.

During the course of these researches, however, another entirely unexpected formation was discovered. In preparations of the choroid, obtained in the manner described above, they observed figures, due to the silver, representing thin, slender, fusiform cells, dentated at the margins and having an elongated oval nucleus. These cells, in a single layer, formed a continuous membrane, covering the entire external surface of the capillary vessels over the entire extent of the choroid. Careful examinations made with various other methods left no doubt in the minds of the authors that these were smooth muscle cells. This was still better demonstrated by the fact that they were able to provoke contractions in pieces of the choroid by the irritation of a heated metallic needle.

The authors propose the name of the *musculus choroideæ* for this muscle. In the rabbit it extends in a simple, uninterrupted layer from the foramen opticum of the choroid to the ora serrata, and then passes over into the ciliary muscle. The fusiform elements are disposed in such a manner that they follow by preference the more considerable external blood-vessels. Their direction is therefore principally meridi-

onal, except that in the vicinity of the optic foramen they are in part circular, becoming completely so at the ora serrata. This circular layer passes at the ora serrata immediately over into the external circular portion of the ciliary muscle. The authors were unable to discover any connection between the muscle of the choroid and the iris muscle. It is finally mentioned that this muscle is present in the eye of man, the dog, cat, and pigeon. Further researches are being made.—*Nordiskt Medicinskt Arkiv. Bd.* 9. H. 3, 1877.

PRIMARY OTITIS EXTERNA DIPHTHERITICA.—Another case of this rare disease is reported by Dr. Kraussold, of Frankfort. The patient, a woman ætat. 22, had suffered for several weeks from a slight inflammation of the right external auditory canal with serous discharge, when she was suddenly seized with severe pain in the right ear, accompanied by tinnitus, deafness, a feeling of fulness, itching, and symptoms of general derangement. No cause could be discovered for this attack. The auditory canal was nearly filled with a grayish-white mass, which on account of the great tenderness of the part could not be removed either by syringing or the forceps. On the second day a portion of this mass was removed with the forceps, leaving a very red, swollen, and partially excoriated spot. On the next day this spot was again covered with a similar deposit. On the fifth day a cast of the deeper portions of the tube, about half an inch in length, was removed with the forceps. The entire posterior portion of the canal was then found to be red, swollen, excoriated, and bleeding in spots. After three or four days this part was again covered with membrane, which was extracted after seven days. At the present time recovery is nearly complete, there being still a slight purulent discharge and some retraction of the drum. The cast removed on the fifth day consisted of a grayish-white, dense, elastic mass; microscopically it was composed of delicate, reticulated fibres, with a few scattered round cells, and pus corpuscles and epidermic cells at the periphery. No typical micrococci groups were found. There was a slight epidemic of diphtheria in the city at the time this case occurred, but a direct infection could not be demonstrated. In this case the swelling and excoriation produced by the preceding simple inflammation of the auditory canal prepared the tissues for the reception of the diphtheritic poison. Without this preparation it is probable that primary diphtheritic inflammation could not have occurred in this situation. Secondary diphtheritic inflammation of the middle ear may extend through a perforation in the membrana tympani into a healthy external auditory canal, but no case has yet been reported in which the disease appeared primarily in this canal as long as the epidermic covering remained intact.—*Centralblatt für chirurgie*, No. 38, 1877.

AMPUTATION OF THE RECTUM.—Dr. Huston Ford, of St. Louis, read before the St. Louis Medical Society an account of a successful operation for the removal of a prolapsed rectum. The prolapse had existed for about two years, and at the time of operation measured from four to four and a half inches in length, and two and three-quarters inches in diameter at its base. The exposed mucous surface was covered with a glairy secretion, but, in spite of this protection, extensive ulcerations had occurred. The case was not a promising one, but, as surgical interference alone proffered any results, it was undertaken. Two operations were performed: at the first, four folds of mucous membrane were ligated, the mass returned to the cavity of the pelvis, and four wide strips of flabby integument removed from the margin of the anus. For a month, while the patient remained in the recumbent position, the prolapse did not return, but, as soon as he was allowed to go to the water-closet, the straining caused the young cicatricial tissue to yield, and the operation proved a total failure. At the next operation ligatures were passed, by a species of transfixion, so as to completely constrict the prolapsed tissue, without closing the lumen of the gut. The strangulation, however, was not complete, and two days afterwards it was found necessary to apply eleven elastic ligatures. These answered the purpose, and five days later the sphacelous mass was removed. During this proceeding the straining of the patient forced a mass of intestines through the end of the stump. This was returned with considerable difficulty, and the rent securely stitched. Two weeks later there was a prolapsed portion of bowel, quite healthy in appearance, about half the size of a hen's egg. The site of the intestinal extrusion had soundly healed. There had been no rise of temperature. Within two days the small prolapse had returned spontaneously and had not reappeared, although two months had passed up to the time of writing. About nine inches of gut were removed, which probably included the entire rectum. Dr. Ford thinks there is not much danger in the operation, and in similar inveterate cases it may be practised with impunity.—*St. Louis Medical and Surgical Journal*, January, 1878.

PLEURISY OF THE APEX.—Dr. J. Burney Yeo, of King's College Hospital, read, in the Section of Medicine, at the meeting of the British Medical Association, a paper on "Pleurisy of the Apex," in which he calls attention to this, as an affection but rarely recognized, although not of uncommon occurrence. The characteristic symptom in these cases is cough. "In a person in apparently good health (generally a young woman), with no marked fever, with no or with slight emaciation, with no dyspnœa, with no mucous or crepitant râles anywhere to be heard, with no expectoration, you have a persistent, harsh, dry, shallow, incomplete cough; generally jarring and shaking the patient a good deal, so as to produce often painful fatigue of the inspiratory muscles, and much injection of the face." What is especially noteworthy about the cough is its shallow, incomplete character. It is suddenly cut short without effecting its object, if, as is generally the case, the object of a cough be expectoration. Friction-sounds are present, but are limited to the supra-spinous fossa, or to the upper third of the dorso-scapular region. Dr. Yeo has never seen a case in the male; probably because they do not wear low-necked dresses. The treatment is continued and repeated counter-irritation, either in the shape of a flying-blister, or of the strong linimentum iodinii. In some cases benefit is derived from small doses of iodide of potassium. The ordinary remedies for the relief of cough may moderate the violence of the paroxysms, and so relieve somewhat the jarring of the chest. The disease is very prone to recur.

The paper concludes as follows: "I have noted cases of this kind now for some years, and, as I have never seen attention called to them, I have thought it might be useful to direct the attention of this association to the subject; believing that as they become better known, we shall hear less of 'hysterical' and 'stomach' coughs, and that 'pleurisy of the apex' will be recognized as a distinct form of pleuritis, with a characteristic clinical history."—*British Medical Journal*, Nov. 24, 1877.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, March 16, 1878.

THE NATIONAL MEDICAL LIBRARY.

In the estimates of appropriations required for the service of the fiscal year ending June 30, 1879, submitted by the Secretary of the Treasury to Congress at the commencement of the present session, we find the following item on page 160: "Printing and binding Catalogue of the Library of the Surgeon-General's Office, 3,000 copies of volumes one and two, including stereotyping, $25,000." In a note it is stated that "the work is not a mere catalogue in the ordinary sense of the term, but an analytical index of authors and subjects, designed to render conveniently accessible to the medical profession the literature of each subject connected with medicine and hygiene."

The character and value of the catalogue referred to are probably well known to the majority of our readers. At first growing out of a necessity for a catalogue of the National Medical Library, it expanded, under the supervision of Librarian, Dr. J. S. Billings, into a universal medical catalogue, an index, as it were, of the medical literature of the world. With the vast amount of material which it was necessary to possess to render the idea of such a catalogue practical, the arrangement of subjects and authors had to be systematized with the greatest care for easy reference. Specimen fasciculi have been issued, and suggestions invited from the medical press of this and other countries, with the result of the adoption of a plan which so effectually combines simplicity with utility that no improvement upon it seems possible. The work necessary to such an end has been immense, and is a lasting monument to the industry and talent of the Librarian as well as to the Surgeon-General, the weight of whose official sanction and encouragement was thrown in the balance. Nowhere has such a comprehensive catalogue been attempted, nor is there likely to be for many a year to come. It is, however, hardly necessary at this time to state any special reasons why the catalogue is of value to the medical profession and why its benefits should be permanently secured by a sufficient appropriation for its publication. The leading men of the profession are unanimous upon these points. As an index of such an opinion we take occasion to refer to the memorial of the Committee of the Medical Society of the County of New York, which is published in another column, and which gives, in a very explicit and straightforward manner, the reasons why governmental aid should be given to the project.

The question as to whether the printing of the work by the Government Printer shall be authorized by Congress is now before the Committee on Printing of the House. As economy is the order of the day, this committee is examining closely the question of cost, which at first sight seems very large. It appears that the entire work will make from seven to ten royal octavo volumes of 1,000 pages each, depending on whether it includes subjects only, or both subjects and authors. The total cost will, therefore, be about $125,000, but this expenditure will be spread over a period of from four to five years, as it will probably be found impossible to print over two volumes a year.

It is quite pertinent not only to ask if the work is worth the cost, but if the cost can be reduced. In reference to this last point the first suggestion would probably be to reduce the number of copies of each volume to be printed. If but 1,000 copies are printed, the cost would probably be reduced about $2,000 per volume.

If the work be distributed gratuitously, the demand for it will certainly be very large, at least equal to that for the Medical and Surgical History of the War, of which 10,000 copies were found to be hardly sufficient. But if the gratuitous distribution be confined to libraries, and private physicians be permitted to purchase the volumes at the cost of press-work, paper, and binding, then 1,000 volumes will probably be sufficient for the gratuitous issue, and from the stereotype plates, to be preserved, a supply can always be furnished in proportion to the demand. Even under this arrangement the cost to the government of the entire work would be not far from $100,000, but we still maintain that the end fully justifies the means.

It has been asserted by at least one member of Congress that the catalogue, although valuable as a reference, is practically useless outside of Washington. This is in part true and in part false, but is hardly an argument sufficiently strong to be used against the project of publication. If the library was an ordinary one, the objection might apply, but as it is the most remarkable and complete of its kind anywhere, and contains works which are exceedingly rare and valuable, the necessity for a full and complete catalogue becomes proportionately apparent. It is now a national library, and as such its natural home is in Washington. Nowhere else could the same number of volumes be collected together for a like purpose,

and with such a gratifying result. We do not believe that a consultation of desirable works by responsible parties will be hindered by the present location of the library, inasmuch as some measures can and will undoubtedly be taken to obviate all such objections. The problem to solve is, how to extend the usefulness of the library by publishing its treasures to the world, and not to contract its sphere by objections which would have equal application to every great library in the world. It is quite proper in this connection to call attention again to the fact that the catalogue, from a medical point of view, is a universal one, and comprises an index of the leading medical libraries of the larger cities of this and other countries, as well as an index of the files of many private libraries. Finally, considering the great advantage which the publication of this catalogue will be to the profession, and through the latter to the public at large, it is asking a comparatively small amount from the government. We hope, then, that the committee will report favorably, and the necessary appropriation be made. In the meantime we think that each one of our readers should exert his influence upon the member of Congress from his district to secure the end in view, that no false idea of economy may stand in the way of one of the greatest benefits which can be conferred upon the profession. As a body we have asked very little in the shape of government assistance, but in this matter the interests at stake are too important to be passed by without a respectful and earnest appeal on behalf of the catalogue in question.

LIBERALISM IN HOMŒOPATHY.

At the last meeting of the Homœopathic Medical Society of this county, an unsuccessful attempt was made to rescind the resolution passed on a previous occasion bearing upon liberalism in homœopathy. As might have been anticipated, the debate was an animated one, and many remarks were uttered which might as well have been unsaid. While a fine opportunity was given to the liberals for explaining their position, and the reason why they voted for the resolution, there was, on the other hand, a melancholy, if not ludicrous, exhibition of bigotry and dogmatism on the part of their opponents. In fact, we are led to the conviction, by the arguments offered on the part of the latter, that their system has no special reason to be proud of their advocacy. But every association possesses some turbulent and truculent members who delight in the position of a conspicuous minority. It would appear that the large majority of the members of that sect in this city and throughout the State desire to be considered physicians rather than homœopaths, and to avail themselves of all, rather than a portion only, of the resources of medical science. That this is the only proper ground upon which men claiming to be scientific should stand is self-evident.

AN ANTHROPOLOGICAL STUDY.

The recent importation of two living specimens of the chimpanzee (Troglodytes niger), and the subsequent death and dissection of one of these animals, have presented a favorable opportunity for practically testing many statements of naturalists, bearing on the relative structural differences between the anthropological apes and the human race.

The subject has been so fully discussed of late years that all are familiar more or less with the general principles involved, and even with the leading facts developed during the prolonged investigation. Darwin concludes his work on the "Descent of Man" with the observation: "Man (in spite of his exalted powers) still bears in his bodily frame the indelible stamp of his lowly origin." It has been, therefore, the study of naturalists to trace in the highest varieties of the order Quadrumana such special features that approach in organization to certain structures that characterizes man, thus bridging over the chasm that separates the human race from the brute creation.

A pair of common chimpanzee (Troglodytes niger) were recently consigned to Messrs. Reiche Brothers, of this city, and placed for exhibition at the New York Aquarium. They were probably about two years of age, and were gentle and docile in their habits. During two weeks the male specimen showed signs of ill-health, during which symptoms of tuberculosis were developed; colliquative diarrhœa afterwards set in, which so exhausted the animal that, for the last few days of its life, it was too weak to be capable of much movement. It was sedulously nursed by Dr. Dohrner, the Superintendent of the Aquarium, but this inveterate constitutional disease (the scourge of our menageries), defied all the treatment, and the chimpanzee died.

Thirty hours after death a post-mortem examination was made by Dr. Edward C. Spitzka, in the presence and with the assistance of many eminent surgeons of this city. The report of the autopsy, which was presented to the Neurological Society at its recent meeting, presents some very interesting features. The body was found emaciated, the omentum deprived of its fat, the intestines the seat of a catarrhal enteritis, and the mesenteric glands tuberculous, enlarged, and cheesy. The lungs revealed several tubercles, some of which had given rise to reactive inflammation, and the pia mater of the brain over the Sylvian fissure contained numerous gray and opaque tubercles of different dimensions. The arachnoid fluid was increased in quantity.

Speaking generally, all the organs strikingly resembled those found in the human subject, and great interest was centred on the examination of the brain. When this organ was removed, all present were struck by its great similarity to the human brain, this being especially apparent when the base was examined.

The cerebrum was richly convoluted and overlapped the cerebellum to the extent of one-third of an inch. Many professional gentlemen present observed that they would be unable to distinguish this brain from that of a human infant.

Mr. Reiche, the owner of the chimpanzee, permitted Dr. Spitzka to retain this interesting organ, and also the spinal cord, and both were placed in preservative liquids, subject to a future detailed examination, which the doctor will make, the result of which will be published on a future occasion.

The following general description will be read with interest: The general outlines, proportions, and dimensions of the brain of this chimpanzee are those of a new-born human infant, as might be inferred from the size and shape of the cranium.

There are, however, several distinctive features, which become apparent only on careful examination. Although the cerebrum overlaps the cerebellum, and consists of the same lobes, is as rich in convolutions as the brain of a bechuana, possessing a well-developed island of Reil, it also has an operculum for the occipital lobe, which is not found in the human subject. One of the most important human-like features in this brain is the absence of a trapezium, and the presence of the olivary bodies. Now, although a rudimentary olivary body exists in the lower mammalia, yet it causes no perceptible prominence of the medulla; such prominence is first observed in the baboon, but in the chimpanzee it is equally full and large as in the human being—a fact in full accordance with the high development of the lateral lobes of the cerebellum, for the olivary body keeps pace in its development throughout the animal kingdom with the development of the cerebellar hemisphere. The island of Reil, whose relation to the higher faculties is strongly upheld by the prevailing physiological belief that it is subservient to the faculty of speech, was also large and well developed.

Dr. Spitzka intends to make this brain the subject of a careful microscopic study. He is now engaged in a series of similar investigations on the brains of various rare species of animals, and believes he can demonstrate that the same plan of development exists, both in the vegetative organs and the skeletons of the ascending scale of vertebrate animals, as in the brain.

It may be interesting to observe that the similarity between the brain of the young chimpanzee and a young human child gradually diminishes with the age and growth of the respective specimens; for while the human brain grows progressively to beyond the age of puberty, at least in the Caucasian and Mongolian races, it becomes arrested in the case of the chimpanzee, on account (as Dr. Spitzka observes) of the closure and non-expansive growth of the brain-case. Thus, while the brain of an infantile chimpanzee and of a newly-born human child do not differ greatly in volume, the adult chimpanzee has a brain which is exceedingly small when compared with that of a grown man.

THE NEW MEDICAL BILL.

A NEW medical bill, emanating from the *Comitia Minora* of the Medical Society of the County of New York, has been presented to the Legislature. It provides for the registration of all persons now lawfully practising physic and surgery in this State, and prohibits any one from hereafter commencing practice in this State unless he shall have a degree of doctor of medicine. The act appears to be carefully drawn, and the provisions for its enforcement sufficient. According to the laws now in existence in this State, persons can be licensed to practise medicine by the censors of any of the county societies in the State. As there are now no less than sixty-four counties, and each county entitled to three societies, it will be seen that there are nearly two hundred licensing boards in this State. That grave abuses are inevitable under such a state of affairs is quite apparent, and any attempt to bring order out of the chaos should receive the hearty endorsement of the profession.

THE NEW PHARMACOPŒIA.

CONCERNING pulsatilla and other matters, Dr. Piffard's article in this issue is very much like a woman's letter—the most important part is in the *postscript*. His account of the drug is interesting, and will be new to many; his experiences with it must be controlled by the observations of others; but his addendum and postscript merit the careful attention of every reader.

Reports of Societies.

NEW YORK ACADEMY OF MEDICINE.

SECTION ON OBSTETRICS.

Stated Meeting, February 18, 1878.

DR. SALVATORE CARO, CHAIRMAN.

VICARIOUS MENSTRUATION.

THE CHAIRMAN read a brief paper upon the above subject, and gave the history of a case in which the hemorrhage occurred from the gums. The patient was 23 years of age; began to menstruate at the age of sixteen; had an attack of intermittent fever in September; menses disappeared, but did not return when the malarial fever was arrested. She soon began to suffer from toothache, which was accompanied by some hemorrhage from the gums. Relief not being obtained, in July following she had the tooth extracted at the time it was giving her great discomfort; blood came freely from the cavity, and the bleeding resisted all means, such as plugging etc., for its arrest, but finally ceased. In August bleeding from the gum returned; application was made to a dentist for

relief; none was obtained, but the bleeding again ceased at the end of four days. In September the bleeding from the gum returned; she applied to a physician; no special relief was obtained, but hemorrhage again ceased at the expiration of four days. In October the patient came under Dr. Caro's care. It was regarded as a case of vicarious menstruation, and the patient was placed under the following plan of treatment:

She belonged to a religious order that imposed protracted and severe religious duties; it was advised to abstain from all these; to take plenty of good food; to wash the mouth daily, for about ten days prior to the time for the occurrence of the hemorrhage from the gum, with tincture of myrrh and water; to take thirty drops of the fluid extract of ergot every four hours; and to apply mustard drafts to the popliteal region.

In October she bled a little from the gum and soiled one napkin. The treatment was repeated in November, but not with as favorable results, for no blood was discharged from the uterus, and the bleeding from the gum was more profuse than formerly.

In December the mouth-wash and mustard revulsives were repeated, and ten-drop doses of the tincture of iodine given in Spanish saffron tea; menstruation returned, without hemorrhage from the mouth, and lasted five days. In January the patient menstruated normally; duration, four days. In February the menstrual function was performed in a normal manner; her health seemed perfect; duration of discharge four days.

Dr. Isaac E. Taylor remarked that Dr. Caro's case was important as illustrating the effect produced in the female economy by malaria. Malaria exerted a powerful influence not only with regard to amenorrhœa, but also with regard to metrorrhagia, affections of the kidneys, stomach, intestines, etc., etc. Hence, the disturbances of the nervous system and the development of neuralgia, toothache, gastralgia, etc. The effect produced upon the system by malaria during pregnancy was much more marked than under other circumstances. Within the past year he had seen six cases of gastralgia dependent upon malaria, and all occurred in pregnant women. Now, when menstruation ceased because of the action of malaria in the system, as it seemed to in the case reported by Dr. Caro, hemorrhage might occur at any point where the blood-vessels were in a weakened condition, whether it was in the mouth, upon the arm, or upon the top of the head. Dr. Taylor referred to one case in which the vicarious hemorrhage occurred from a patch upon the arm; also to another, in which it occurred from a broken surface upon the top of the head. Mention was also made of a case in which hæmatemesis was substituted for menstruation. The uterus was measured and found to be 3½ inches in depth. A sound, having a large end, was introduced a few times prior to the time for the occurrence of menstruation; the uterus was increased in size to a little over four inches, owing to the normal ductility of the organ; menstruation came on, and then the uterus was very much reduced in size; a process of involution, as it were, was accomplished. At the end of two months the menstrual flow was fully established. If that plan of treatment was adopted, the sound must be used with the greatest gentleness and care.

Dr. Hubbard referred to a case in which the patient was supposed by her physicians to have hemorrhage from the lungs, because at each menstrual period she expectorated blood. The expectoration of the sanguineous fluid lasted three or four days; she was then entirely free from it until the next menstrual period, and the phenomenon continued until near the close of her menstrual life. The woman was in very good health, and no treatment was introduced except that directed to her hysteria.

Dr. Church mentioned a case in which hemorrhage occurred monthly from the umbilicus; but the history was incomplete, from the fact that circumstances were such as to forbid complete examination. There was no menstrual discharge per vaginam, and the doctor was unable to say whether or not a vagina existed.

Reference was made by several members to cases in which existing discharges, such as discharge from the ears, from ulcers, etc., etc., were aggravated at the menstrual period.

PLACENTA PRÆVIA WITHOUT HEMORRHAGE.

Dr. Isaac E. Taylor related the history of a case in which the placenta presented, yet delivery was accomplished without hemorrhage and almost without pain.

The woman was æt. 25, not very robust, and at nearly full term presented an appearance as if only in the fifth or sixth month of pregnancy. The doctor was called to decide whether or not the child was living. Neither placental murmur nor fœtal heart could be heard. By external manipulation the conclusion was reached that the head of the child was in the cavity of the pelvis, thus accounting for the apparently small size of the child. The doctor called again at about four o'clock, when, on examination, the neck of the uterus was found to be about one inch in length, and undilated; pains very slight and irregular; and the finger came in contact with a globular mass, which was quite soft as felt through the uterine wall.

At 6½ P.M. Dr. Taylor was summoned, and found the pains quite regular, the neck dilatable so as to permit the introduction of the finger, and a very soft substance was felt; the ordinary show was absent; there was quite an abundant secretion of mucus; and he was unable to determine the nature of the soft mass.

At about 7.20 P.M., with a single expulsive effort, the placenta came down, child and all, and the labor was completed without loss of blood. On examination the head of the child was found to be hydrocephalic; the placenta was 3½ inches in width and in a complete state of fatty degeneration.

Dr. O'Sullivan mentioned a case in which there was placenta prævia, but no hemorrhage, and when labor was completed the placenta was found to be the seat of complete fatty degeneration.

The Section then adjourned to the dining-hall, where the members and guests, on invitation by the Chairman, partook of a bountiful collation.

A Medical Black-Book.—The profession in Antwerp has a black-book, in which the names of all persons who neglect to pay the fees of their physicians are recorded. The laity is allowed from January to November in which to pay their doctor's bills, but any one still in arrears, without sufficient reason, on the 30th of November, is ruthlessly posted in the black-book. A revised edition of the book is published every year, and furnished to the members of the Medical Society.

Correspondence.

COMMITMENT OF THE INSANE.

To the Editor of The Medical Record.

Dear Sir:—I have read with much interest your articles on the Commitment of the Insane, in which you speak of the case of Miss Dickie. As a member of the Commission "*de Lunatico Inquirendo*" in the case, and being familiar with all its details, I desire to call your attention to several inaccuracies in your articles, and to state a few facts which you may have overlooked.

The most noticeable inaccuracy is the statement "that the very appointment of a guardian so effectually stultifies the ruling of the court that the case, as a leading one, must certainly have a short life." I am in a position to speak authoritatively upon this point, and would most respectfully state that no guardian has been appointed, such a procedure not being deemed necessary by the judge, and being only suggested by the sheriff's jury. In regard to the statement "that the patient was undoubtedly insane, and would have been deemed a proper object for asylum treatment," I would respectfully differ from you in opinion. I have watched the case carefully, and state that the weight of evidence was undoubtedly in favor of sanity, and in the language of the learned Judge Brady, "applying the tests which human ingenuity has devised, the declaration was legally and properly made that Miss Dickie is neither insane nor an imbecile." And I believe his Honor was fully justified in discharging the supposed lunatic from all custody and restraint.

You state "that one of the gentlemen who constituted the original commission had special facilities for the study of cases of insanity by an experience of several years as medical officer in an asylum." I believe this is inaccurate, neither of them having held any such position. If the testimony elicited on the trial is to be relied on, your statement, "that the treatment adopted in Miss Dickie's case was in all respects justifiable and orthodox," is also open to criticism.

You speak of the jury as "simply giving the benefit of the doubt to the plaintiff." On this point let me say that I feel confident the jury to a man gave the verdict unhesitatingly, and that none of them had doubts for a moment. The jury, having heard all the evidence, said Miss Dickie was not insane! The law gives them the power to say so, and they of course take the responsibility, which, in this instance, I beg to say, I do not consider misplaced.

Now, what are the facts? First, Miss Dickie is not insane. Second, she is not under guardianship at all; she is her own mistress, and a free agent. The fact that she is not, and has not been insane, shows error in the system relating to the commitment, care, and cure of suffering lunatics. All the logic from the north to the south pole would not change this.

In conclusion, let me state that there certainly does "seem to be enough obstacles standing between the patient and the medical superintendent of the institutions for the insane," yet they seem to be easily removed, else there would hardly have been such a case as Miss Dickie's, and the community would not be calling for further legislative enactments to protect them from a similar experience.

Respectfully yours,

E. Bradley, M.D.

1 West 24th Street.

[We are much obliged to Dr. Bradley for calling our attention to the above points. As far as the question of sanity is concerned, we of course accord to him the right of holding a different opinion from us. If his position is the proper one, then many collateral circumstances depending upon it are untenable from our standpoint. We are happy to be informed that no guardian was deemed necessary by the judge. The gentlemen to whom we referred as constituting the original examiners we presumed to be Drs. Alfred C. Post and C. W. Packard, and applied our remarks accordingly.—Ed.]

ON VACCINATION.

To the Editor of The Medical Record.

Sir:—The subject of vaccination is acquiring quite a prominent place in your pages; but still nothing beyond what it deserves. Permit me to make a few very brief remarks upon *humanized vaccine lymph*.

Seeing the inestimable benefit of vaccination to suffering humanity, it is surprising that any ignorance or prejudice regarding it should exist. Dr. Henry Austin Martin, in a candid and trenchant article in the Record for January 26th ult., refutes as well as exposes part at least of the ignorance which obtains, even in the minds of some medical men, and the carelessness with which vaccination is performed sometimes. To perform vaccination properly is a very simple and safe proceeding with those who thoroughly understand it; that it is at least, a highly dangerous operation in the hands of ignorant or careless persons is beyond question.

I know of no advantage which bovine lymph possesses over humanized, if due care be used in the selection of the latter. But as long as the present practice of buying and selling "crusts," the source, purity, and efficacy of which is, to say the very least, doubtful, prevails, so long must the preference be given to bovine lymph, although personally I am not in favor of its use. As yet I have only used humanized lymph, and so far have every reason to feel perfectly satisfied with its results.

The "dried crust" or scab from a vaccine sore may be considered a morbid product to be got rid of by the system as speedily as possible. It must be difficult, if not impossible, to obtain a "crust" free from blood-corpuscles, even though in a dried state. Lymph, fresh and fluid, from the vesicle from the fourth to the eighth day, might be looked upon as rather in the light of a *quasi*-physiological product. To my mind all the danger and difficulty with humanized virus lies in the use of the "dried crust" (dissolved just before use) instead of the fluid lymph. Why the "crust," which contains only a small percentage of dried lymph, should be employed in preference to the pure, fresh, and liquid variety, I cannot understand. This "crust" has been dried by the rupture of the vesicle and escape of the contents, together with the evaporation caused by the body heat and the action of the air. Its elements must be more or less decomposed. How partially decomposed blood-corpuscles, leucocytes, epithelial scales, etc., when introduced into the circulation of a child or adult, can be free from danger is a mystery to me. The wonder is, not that a few accidents have happened (perhaps all the accidents have not been reported), but that more do not occur.

Vaccination from arm to arm is, perhaps, the best of all methods. The only excuse for the use of the "dried crust" is the facility of preservation, when lymph must be kept longer than ten or fifteen days. But this is a paltry, even contemptible excuse, when it can be preserved in a fluid state for a much longer

time in hermetically sealed capillary tubes. Lymph so preserved retains its vitality and vigor unimpaired for almost any length of time. I have kept it for *seven and a half months*, at the end of which time it was pure, fresh, fluid, perfectly safe and active. I never use the crust, and never had one preserved for me, though offered seventy-five cents each for them. Their use, to my mind, is fraught with danger, and I order them thrown away or burned.

After vaccinating a patient, I am careful to wash the lancet thoroughly and immediately—always to keep it clean and free from any approach to rust. When the lymph is carried on "ivory points," I wash them carefully in warm water, and dry them thoroughly before setting them aside. I do not use a capillary tube more than once. They are too small to be properly cleaned. I always preserve my own lymph, taking my supply from a perfectly healthy child, between the ages of six weeks and six months, and can, therefore, always answer for the *quality of the lymph used*. I usually vaccinate between the ages of two and three months—before the process of dentition commences, and at an age when children suffer least from the constitutional effects of vaccination.

With these precautions faithfully adhered to during the last six years, I have not had a single bad symptom following vaccination, although I have practised it more freely during the winter than during the summer months; and that, too, when both scarlatina and diphtheria—especially the former—prevailed extensively in this city during the past four winters. In secondary vaccinations I make two sores, but in primary vaccinations I aim at securing three or four vesicles. Four insertions, each as large as a silver dime piece, on the front of an infant's arm, must be so close that the normal inflammatory areolæ merge into one another. Still, I never saw any approach to erysipelas. I never had any sloughing; never an abscess; never any untoward effect. On no single occasion has the vesicle been slow or delayed in forming (as sometimes happens, I understand, when "crust" is used), and from the fourth day was quite perceptible. The vesicles invariably matured on the ninth day, and began to subside on the twelfth day. Out of one hundred cases, of which a correct and careful register was preserved by me, there were only two failures to take. These were secondary vaccinations in grown-up children. In these one hundred cases the ages varied between six weeks and thirty-seven years. The majority were very young children, some of whom were weakly, delicate, or puny; some were even syphilitic. Each child had, on an average, three sores. In all, even in the syphilitic (congenital) cases, which I watched with increased interest, the vaccination pursued a perfectly normal course, the scabs falling off about the twenty-sixth day. My method of making the insertion is by numerous very fine vertical and horizontal scratches through the cuticle.

If medical gentlemen will preserve their own lymph in a fluid state, in hermetically sealed capillary glass tubes, allowing the lymph to flow directly from the punctured vesicle into the capillary tube, taking care that no sign whatever of blood shall be mixed with it, whenever they are obliged to keep a supply longer than fifteen days, they can always have reliable matter. They should take the lymph generally on the *eighth day*, and invariably see that the child supplying it is healthy and vigorous. By so doing the lymph cannot be impure, decomposed, nor purulent; they can avoid ninty-nine hundredths of the dangers which surround humanized lymph. If they would so act we should hear less of the accidents and even deaths which occur, while most, if not all, of the prejudice and doubt as to the reliability of vaccine lymph from the child would be removed.

P. O'CONNELL, M.D.

CHICAGO, February 9, 1878.

MATERIA MEDICA AMONG THE CHINESE.

IN July, 1872, M. M. Dabry de Theirsant, Consul of France in China, and Dr. Leon Soubeiran submitted to the French Academy of Medicine a compact little work, the simple title of which, "*Matière Médicale chez les Chinois*," was sufficient to excite a lively curiosity. We have taken the liberty of translating a few selections, made at intervals throughout the text, and from the accompanying report of the commission to whom it was referred by the Academy.

The authors, says the report, have united in common their efforts and the fruits of their labors, in order to make better known the therapeutic agents and indirectly some of the medical ideas of a people whose progress seems to have become arrested after it had advanced more than others in science, industry, and the arts, and who yet maintain a high standard of civilization, and are in possession of ideas and procedures (empiric or rational), the acquisition of which may be of some value to Western nations. It is not the first time that such an enterprise has attracted the attention of physicians and naturalists. Medical literature has been enriched within the past few years by the researches of Tartanov, Debeaux, Porter Smith, and Daniel Hanbury, whose valuable investigations have, however, been only more or less complete, by reason of difficulties inherent to such an inquiry.

Almost all the medicines employed by the Chinese are in a state of *mélange*, rendered unrecognizable by successive infusion in different liquids, or reduced to powder, or at least in so finely divided fragments as to be indistinguishable. But the authors seem to have sufficiently well informed themselves so as to be able to present, with some degree of precision, the therapeutic arsenal of the Orient. The list comprises nearly one thousand names, made up from the minerals, animals, and vegetables. For the latter two they have adopted, as far as obscurity of text will admit, the natural classification. Each group is subdivided into families, which are designated by their Chinese vulgar names, and also by proper scientific terms.

What surprises as we glance over the list, is that we see reproduced there, both in general and detail, the qualities we are accustomed to attribute to our own agents, and indeed a large number of those employed by us. And what is more a matter of surprise, they seemed to have established a similarity of indications, and up to a certain point an analogy of ideas and theories which govern their employment. Their science is of course by no means as complete as our own, but resembles more—indeed one seems to have before him—the materia medica of Geoffry, or the practice of Aretæus, in which an incipient science mingles some honest and reliable observations with the errors of charlatanism and the popular superstitions of the times. We are not disappointed, therefore, if we find a faith in specifics prevailing in their medicine, as it has often heretofore led us in ours.

Each substance is given a virtue essentially—anti-rheumatic, anti-spasmodic, or something else—and to mixtures of these single remedies is ascribed the power to heal immediately tubercular disease, or syphilis, or rabies, and so on *ad libitum*. Besides this, the Chinese

are persuaded, as were our ancestors during the middle ages, that Providence, little trusting our instinctive faculties, addresses directly the understanding, in order that the harmful may be at once distinguished from the useful substances. Under this belief they imagine a certain stigma to be placed upon the poisons, and some embellishment upon the remedies, so that the services expected from each may be immediately apparent to man. They term this "*la doctrine des Signatures;*" and a belief in this singular dogma reveals itself at every step in Chinese materia medica.

It is on account of this, doubtless, that madder (*Rubia munjista*), the root of which is *red*, is given to provoke the menstrual flow; that the *Polygonum tinctorum*, which furnishes indigo, is reputed efficacious in petechial fevers; that the reniform fruit of the *Kadsura chinensis* has aphrodisiac properties; and that ginseng, the bifurcated root of which resembles the human thighs, has the power to restore to invalids strength, and to libertines their waning virility. From considerations of the same sort is founded the reputation of the *Cordiceps sinensis*, as an excitant of the generative organs; of the *Bidens parvaflora*, as an infallible remedy to make the nails grow; or of the *Vitex incisa*, to increase the beard; also that the dried placenta is administered in pill form to facilitate accouchement, and favor the expulsion of the fœtus. From the same idea, probably, the horns of the buck are exposed for sale, elegantly adorned, and enjoy a high reputation among the crowd of surfeited or impotent lechers, who employ them as a remedy in order that they may not be deficient in the vigor and becoming ardor which that noble fellow displays at the period of his amours. These are curious illusions, but they merit indulgence on the part of us whose ancestors were not free from as quaint ideas of pharmacy.

In some instances, the Chinese give evidence of a really skilful judgment, and exhibit scientific tendencies which serve, at least, to make their errors the more absurd. For example, we see, in their materia medica, the astringents, both vegetable and mineral (galls, alum, acetate, and sulphate of iron, the salts of lead and silver), serve in their proper places: *Salix babylonica*, *Populus tremula*, *Dichroa febrifuga* arrest excessive perspiration, atonic diarrhœa, spermatorrhœa, and ague. The aromatics, essential oils, and balsams serve as diffusible stimulants, febrifuges, anti-spasmodics, to relieve catarrh, etc. Likewise the medicines furnished by the labiatæ, umbelliferæ, and aromatic compositæ, myrrh, storax, sandal, cubebs, and many others. Artimesia and saffron have their reputation as emmenagogues, and a confidence in the abortifacient power of the ergots of rye and maize is implicit. The healthy grains of the latter enter into the fabrication of a beverage identical with that obtained in a like manner and from a similar source in our own country. Chinese medicine has employed from time immemorial the mercurial preparations in syphilis, which they use both internally and by fumigation; arsenic in strumous and herpetic affections, and in certain intermittents; iron, under eight different forms, fills its place as a hæmatic restorative; borax is prescribed for aphthæ; nitrate of sodæ, as a diuretic; carbonate of lime, as an absorbent; and the oil and lime-water liniment, as an application to burns and scalds. The ancient authors recommend the ashes of seaweed for goitre. They use, as we, the sulphates of copper and zinc, castor oil, gamboge, colchicum, aloes, rhubarb, aconite, veratrum, camphor, musk, opium, and the poisonous solanaceæ.

The hæmostatic value of cold water is well known, and especially advised in uterine hemorrhage. They employ the cold bath in the treatment of fevers; cold compresses are used in the stupor of drunkenness and in asphyxia from carbonic dioxide. Their thermal, chalybeate, sulphurous, and alkaline springs have a high popularity. It is believed that those who receive and keep their drinking-water in leaden vessels enjoy an immunity from goitre, which suggests the possibility of preventing or removing that deformity by administering the saturnine preparations. According to them lead modifies greatly the specific effects of mercury. They have their sialagogues, anthelmintics, expectorants, and diuretics similar to ours, and they believe themselves to possess a great number of substances capable of preventing or dissipating intoxication (*Bretonica officinalis*, *Novenia dulcis*, *Chrysanthenum alba*, *Myristica*, *borax*, *etc.*). They fill out quite a list of galactophoræ and galactogogues. And what is more remarkable, is, that surgical *anæsthesia*, general and local, is of very ancient use. A Chinese surgeon (Houa-to), relates that he employs a species of *atropa*, (?) described in the *Pentsao*, which produces an insensibility sufficient to permit severe operations involving the lower portion of the body (*bas ventre*). *Datura alba* acts in the same way. It is said that insensibility is often maintained several days. The condition is probably narcosis. A mixture containing the powder of *Aconite rad.* is used to produce local anæsthesia for minor operations.

It is unnecessary to prolong the parallel. The examples cited are amply sufficient to exhibit the general similarity of their materia medica to that of other nations.

The theoretical ideas of our antipodes conform, likewise, somewhat to those which govern us. They are generally more rational and more advanced than we would suppose.

Along with the old doctrine of specificity appear physiological ideas evidently more modern; for example, we find in many passages an affirmation of the pathological conditions of the fluids. An undetermined *Bignonia* restores the impoverished blood. To rhubarb is ascribed the power not only to prevent its corruption, but also to render it fluid when once coagulated. But naturally it is the solids which are more often the seat of lesions; and as each of the more important remedies is assigned to one or more of the more important viscera, the different portions of the organism are treated by their appropriate remedies alone. Sometimes, it is true, an active remedy, like a certain *Carduus*, operates simultaneously by what Chinese medicine terms the *douze voies* (the twelve ways) and affects with one blow the entire economy, after the manner of a brilliant emetico-cathartic amplified by a generous excitation of all the eliminative and excretory functions.

The elimination of poisons, and consequently of medicine, is effected by special avenues, which permit, when fully mature, the morbific material to evacuate the body.

Hence the method they have of treating hydrophobia by the *Mylabris chicorii*, which contains rather more cantharidin than ordinary Spanish flies, or by grasshoppers, which provoke the abortion and expel the *canine fœtus*, with which the victim is supposed to have become impregnated at the occasion of the bite by the rabid animal. The strangury and hæmaturia induced by the irritating remedies encourage the delusion that delivery is accomplished through the urinary passages. The authors do not say whether the treatment is successful or otherwise.

The same means are used to abort the human fœtus,

although the laws against the crime are exceedingly severe.

According to them *arsenic* finds an efficient counter-poison in the *Phaseolus angulatus*, which makes it appear that a species belonging to an inert genus possesses exceptionally a pharmaco-dynamic activity comparable to that of calabar bean. The stings of scorpions and the bites of venomous reptiles are treated by the fumes of sulphur. Nitrate of soda comes in, not only as a diuretic, but also as a lotion in ophthalmia and opacity of the cornea.

It is hardly prudent to continue the recital. Only a tithe of the materials can, of course, be mentioned. While many are employed under superstition and ignorance, others really deserve the place they occupy, and some, without being heroic remedies, will certainly attract the attention of therapeutists, and well deserve to be submitted to the test of experiment and severe clinical observation. Such are the *Anemarrhena asphodeloides*, employed for the same purpose as squills; the *Pardanthus chinensis*, to which is attributed qualities more remarkable and varied; the *Pupalia geniculata*, the acrid root of which is sialagogue, and used in rheumatism; the *Passarina chamedaphne*, used as cordial, tonic, and febrifuge; the *Gynocordia odorata*, the seeds of which are prescribed in dermatoses, specific or other; the *Tournifortia argusina*, the *Trichosanthes dioïca*, and also the *Dichroa febrifuga*, the reputation of which is great in Cochin China, and which merits, without doubt, the right of succeeding cinchona.

Such are the salient points observed in looking over the work. They indicate something of the actual state of the Chinese medicine and its tendencies, and serve at least as curiosities, though it is probable they will attract more attention to the East, which will ultimately develop more important facts and questions bearing upon the medicines of this singular people.

GEO. O. WILLIAMS, M.D.

GREENE, CHENANGO CO., N. Y.,
Jan., 1878.

THE ULTIMATE RESULTS OF EXCISION OF HIP-JOINT.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—At a meeting of the Medical Journal Association, February 1, 1878, Dr. Sayre is reported (MEDICAL RECORD, No. 382, pp. 175, 176) as making the following remarkable statement: "Almost every case he [Dr. S.] had operated upon had been given up to die, yet of *eight* cases *which had been discharged from the Hospital for the Ruptured and Crippled as incurable, seven had made good recovery*" [my italics].

The doctor, I find, has been incorrectly informed as to the condition in which and circumstances under which the patients left the hospital; and I very much regret his incautious use of the term "incurable," based on such misinformation. Whether "good recovery" can be predicated of *seven* of the *eight* is one of the objects of this communication.

March 3, 1878, I called on Dr. Sayre, and, at my request, he and his son, Dr. Louis H. Sayre, very kindly gave me the names and numbers of the cases to which reference had been made.

CASE I., No. 37,* removed from the hospital March 25, 1872. On admission, the disease had already advanced into the second stage; six months later a small abscess appeared on the anterior surface of the thigh, and this alarming the mother, caused her to remove him, although urged to the contrary. The prognosis was good, and there was *no* sign or symptom present warranting his *discharge as* "*incurable*." Excised "Jan. 22, 1873"—ten months after leaving the hospital. This is the case presented the evening of Feb. 1st, and reported (RECORD, p. 175) as "formerly under treatment at the Hospital for the Ruptured and Crippled, in which there was enlargement of the liver, waxy casts in the urine, etc." The impression is left that such was his condition on removal—and yet in "Orthopedic Surgery," where the case is included in the table (No. 37), no allusion even to these amyloid changes is made. Such was *not* his condition while in the Hospital for Ruptured and Crippled.

CASE II., No. 46, was removed Sept. 2, 1873; general condition very good; disease in hip long since arrested; a little motion at the joint; limb, however, considerably deformed, and one inch short; no pain or tenderness or open sinuses; in fact, the boy was admitted for the relief of the deformity, and not left long enough to derive much benefit from the treatment. Excised "Dec. 10, 1873"—three months after removal—and his condition at this time is given, not as emaciated or suffering from exhaustion, but "leg flexed and adducted; several sinuses leading to dead bone on outer part of thigh." While in our hospital, there was *no* pretext for prognosticating incurability, and the case was *not discharged* "*incurable*." The result of the excision is given: "movable joint, can bear weight on limb, ¼ inch short"—nothing more. We are not told whether any sinuses remain open or whether any deformity exists. The whereabouts of the boy, I believe, is unknown.

CASE III., No. 47, was removed from the hospital Aug. 22, 1873, by the mother, who was offended because reprimanded for persistence in feeding the child all manner of indigestible articles. The patient had suffered much after the opening of a large abscess, but the drain was becoming less, and an improvement was observed a few days prior to removal, and so noted on the records. The case was *not discharged* "*incurable*." Excision "Jan. 21, 1874"—five months later—and death "from exhaustion, April 7, 1874."

CASE IV., No. 53, was first admitted to the hospital Feb. 13, 1872—first stage—and discharged cured, not a sign of disease to be detected, April 20, 1872. Readmitted Aug. 18, 1873, in second stage—abscess forming, limb deformed, and child unable to walk. Relapse reported as of two months' standing. The abscess opened, and another formed, producing much constitutional disturbance, but the danger was considered passed, when the mother, against our advice, removed him, and all further treatment was discontinued. He was *not discharged* "*incurable*." Excised "Feb. 6, 1875"—five months later. Through the courtesy of Dr. Sayre, I was enabled to see the boy, at 15 West Street, March 4, 1878, and found him in apparently good health, able to walk without support, though limping and incurving the spine by way of adaptation. The liver extends (I employed palpation, percussion, and measurement) 3½ inches below the free border of the ribs; the urine I did not examine; the thigh is anchylosed (?) at an angle of about 135° with the pelvis. A slight degree of motion is possible, I think, if great force be employed and pain be produced; the father himself attempted this by way of employing passive motion. The limb is 1½ in. short by careful measurement; two open sinuses in the track of the incision wound remain; the oakum dressing was well covered with sero pus, and the father and mother told me that the wound

* The numbers refer to the table of Exsection in "Orthopedic Surgery," by Dr. L. A. Sayre, pp. 314-326.

had never closed since the date of the operation, three years ago. They told me, unasked, that a second operation was soon to be performed for the removal of dead bone.

CASE V., No. 56, admitted to the hospital June 9, 1874, and the disease was so obscure that a diagnosis was made simply on the strength of a moderate *tenseness* of the adductors. Removed much against our will July 17, 1874—one month and eight days after admission—the disease being still enveloped in obscurity. It is useless for me to say of this case, "It was *not discharged 'incurable.'*" Excised "April 21, 1875" —nine months after removal. Result in table not given, though Dr. Sayre informed me March 3, 1875, that he had recently heard from the boy through a friend (medical, I believe), who reported, "Motion perfect, one inch short." This case I have not had an opportunity of observing, and I believe Dr. Sayre has not.

CASE VI., No. 60,* Chas. Pixlee, operated on subsequently to the publication of Dr. Sayre's book, and hence not included in the table. Removed from the hospital May 17, 1875, through an officious aunt. The boy was emaciated and had suffered much from an abscess which had opened one month previously. We insisted on his remaining, and did *not discharge him "incurable."* Excised "February 2, 1876," and "died April 19, 1876, from exhaustion."

CASE VII., "R. M. B. Potter, of Newport, R. I.,"† was never treated as an inpatient of the hospital, and I find no record of his case. Dr. Knight, the Resident Surgeon, has a distinct recollection of the case, and asserts that the child was brought to him, and seen as an out-door patient at long intervals during the spring and summer of 1875, from Newport; that he observed the advance of the disease, and insisted strongly on having the patient placed in the hospital, in order that the case might be under his control; that this advice was not taken; that the last time he saw the child there was no open sinus, no abscess, and no sign of an abscess; and that he *did not discharge* the case *as "incurable."* Excised "November 23, 1876," and Dr. Sayre tells me that he is cured, but is suffering from malarial poisoning, is in the south of France, and up to last accounts the mother was in search of certain baths, reported as beneficial to patients with *hip-disease.*

CASE VIII., No. 61, Chas. Smith,‡ was never in the hospital, and I have searched diligently for his name among the indexed out-door patients (all who were ever treated here are indexed) between the years 1872 and 1876 inclusive. I have failed to find the name of any such patient with hip-disease, and I have no recollection of ever having seen the case.

So that the eight become *seven;* the "eight discharged incurable" become *not one discharged incurable;* the *seven* "good recoveries" (excluding the last one as never having been under treatment in the hospital) correctly interpreted, as follows: *one* "good recovery," with a possible *three, i. e.*, if case No. 46 and the Potter case can be included, both of which, however, for the sake of Science, should be still *sub judice;* one doubtful (No. 56); one still uncured (No. 53), and probably incurable; and *two deaths* from exhaustion!

Respectfully submitted,

V. P. GIBNEY, M.D.,
Assistant Surgeon to Hospital for the Ruptured and Crippled.
135 E. 42D STREET, March 4, 1878.

DR. JOHN S. BILLINGS AND THE NATIONAL MEDICAL LIBRARY.—Our attention has been called to an item on page 173, in which it is stated that to another gentleman than Dr. John S. Billings is due the credit of arranging and completing the index of the subjects of the National Medical Library. We are happy to correct such an error, and state that to Dr. Billings's rare knowledge of medical bibliography, to his wonderful patience and arduous labor, are due not only the present perfection of the catalogue, but the real value of the library itself. The item to which we refer came to us from an apparently responsible source, and its contents did not command such a scrutiny as to matters of fact as would otherwise have been the case. As it is, however, it carries its contradiction on its face.

CULTIVATION OF TEA IN INDIA.—The cultivation of the tea-plant was begun some time ago in the north-eastern provinces of India, and it has already assumed large proportions. In quality, the tea produced is equal to the better Chinese teas. The tea-plant has also been successfully introduced into certain favorable portions of the island of Ceylon; the results have surpassed the expectations of the introducers.

* This case came from Havana sick with the disease.

THE NATIONAL MEDICAL LIBRARY. — A memorial from the Committee of the Medical Society of the County of New York:

To the Senate and House of Representatives of the XLV. Congress of the United States of America:

The undersigned Committee of the Medical Society of the County of New York have been appointed specially for the purpose of respectfully submitting to the Honorable the Senate and House of Representatives of the United States, the following considerations:

That the European governments spend a large amount of public moneys on institutions of learning, such as universities, museums, and public libraries.

That particularly the medical departments of foreign universities are supported by public funds, for the reasons that their expenses are necessarily large to accomplish their ends; and that the governments have no interest of greater importance than that of securing by such means the best possible protection of the life and health of the people.

That the generosity of the Government of the United States, as shown in the publication of the "Medical and Surgical History of the War of the Rebellion," is gratefully appreciated by the profession, but with the exception of the benefits secured by such means—and which it is proper to say are incalculable—the present elevated standard of American medical learning and literature is almost exclusively due to the individual or corporate exertions of private citizens.

That the medical profession of the United States have good reasons to be satisfied with the accomplished results, and that in this petition they are not asking for anything more than needful aid in the promotion of medical progress, and for the consequent advancement of public interests.

The undersigned committee beg leave further to submit the following:

That the munificence of Congress and the unparalleled industry of the officers connected with the Surgeon-General's office, have succeeded in creating in Washington the National Medical Library, which has already been of very great utility in the very few years of its existence, and which, when increased and carried on in the same spirit, will prove invaluable for the development of American medical literature and the elevation of the standard of American medical education.

That its vast literary wealth, contained in nearly a hundred thousand volumes and pamphlets, is for the most part, however, inaccessible to literary men, who, in order to work progressively and advantageously, have to search for and utilize accumulated scientific material.

That the Surgeon-General of the United States, and particularly Dr. John S. Billings, have prepared a Subject Catalogue—a specimen fasciculus of which has been hailed with joy and enthusiasm, and with unprecedented praise, by the medical press of the United States and of all Europe, particularly of England and Germany.

That this Subject Catalogue, arranged in alphabetical order, and with the greatest accuracy, will, by its publication, place the buried wealth of the medical literature of all countries at the easy and ready disposal of scientific workers.

That, finally, the completion of this great work is a necessity for the medical profession of the United States, and for the healthy development of medical culture of this and all countries, and that it will rank amongst the most practical and beneficial publications of the present period, and that the government cannot possibly spend its funds on any publication of greater importance than that of the Subject Catalogue of the National Medical Library, as prepared by the present Librarian.

The undersigned committee, therefore, request the Honorable the Senate and the House of Representatives of the United States to appropriate the funds necessary for the completion of the Subject Catalogue of the National Medical Library of Washington. And your petitioners will ever pray:

Signed:—C. R. Agnew, Fordyce Barker, F. J. Bumstead, J. C. Dalton, J. T. Darby, W. H. Draper, F. Delafield, E. Eliot, T. A. Emmet, H. P. Farnham, A. Flint, F. H. Hamilton, J. B. Hunter, A. Jacobi, E. G. Janeway, J. R. Leaming, A. L. Loomis, W. T. Lusk, T. M. Markoe, J. T. Metcalfe, E. Noeggerath, H. D. Noyes, Willard Parker, G. A. Peters, J. C. Peters, A. C. Post, A. E. M. Purdy, D. B. St. J. Roosa, G. A. Sabine, H. B. Sands, L. A. Sayre, G. F. Shrady, S. Smith, I. E. Taylor, T. G. Thomas, W. H. Thomson, W. H. Van Buren, J. R. Wood.

DR. SETH SHOVE died at his residence in Katonah, this State, on the 24th ult. He was born in Warren, Litchfield County, Conn., August 8, 1805, and was the youngest but one of eleven children. The family were of English origin; his great-grandfather of the same name, the first minister of Danbury, Conn., died Oct. 3, 1735, in his sixty-eighth year.

The doctor received his medical degree from Yale College, March 4, 1829, and in the following August settled in his late residence, where his work, only twice interrupted to any extent by illness, was cheerfully and conscientiously performed almost to the very hour of his death.

He achieved an enviable reputation, both as a physician and surgeon, held many positions of honor in several medical societies, and was noted for his self-reliance, acute observation, ripe experience, and singular modesty.

PRESERVATION OF LEECHES.—In the country and in places where there are no apothecaries, it is often necessary to keep leeches for a length of time. It is stated that this can be readily done, if 80 drops of a solution of salicylic acid (3 : 100) be added to the water in which they are placed.

SMALL-POX IN ALGIERS.—Advices from Algiers to December 1st state that the epidemic of small-pox in that city has made alarming progress. The cases are most numerous in the outskirts of the city. The average daily number of deaths is from 20 to 25. The disease is most virulent among the Arabian population, which is crowded within the limits of the filthy Casbah. The entire foreign population has left the city. A small pox hospital has been established in the Jardin d'essai, which is situated a short distance out of the city between Hussein-Dey and the lower Mustapha.

A VETERAN DOCTOR.—Dr. A. Simon, of Berlin, celebrated last month the sixtieth anniversary of his graduation as a physician. He was born in 1797, and served as a volunteer during the campaign of 1815, in the 9th or "Colberg" regiment of infantry, a regiment which is still in existence. He subsequently studied medicine in Berlin, and received his degree on the 6th of January, 1818.

CONGENITAL DISPLACEMENT OF BOTH LENSES.—Mr. Wordsworth exhibited, at a late meeting of the Medical Society of London, six persons belonging to one family, who were all affected by congenital displacement of both crystalline lenses.

NOW READY.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS

By SIDNEY RINGER, M.D.,

Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price, - - - - $4.50

"Upon the appearance of that now indispensable work, *Ringer's Handbook of Therapeutics*, my attention was particularly attracted to the frequency with which he recommends small doses of medicine that we have been accustomed to use in much larger doses for entirely different diseases. Some of these remedies were recommended so strongly, that I was induced to give them a trial, more especially as my practice among children compels me, for many reasons, to administer as little unpleasant-tasting medicines as possible. Their use with children first having been found satisfactory, my position in connection with the New York Dispensary afforded me the opportunity of further testing them in numerous cases of adult ."—DR. DESSEAU *in Medical Record, July* 28, 1877.

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on Therapeutics."—*St. Louis Med. and Surg. Journal.*

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen.—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KEEN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,			**With Hops (Plain),**	**$1 00**

MANUFACTURED BY

TROMMER EXTRACT OF MALT CO.,

FREMONT, OHIO.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL, and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist,

Explanatory Circular mailed on application.

(P. O. Box 4,517), 2 and 4 Platt Street, New York

LOEFLUND'S EXTRACT OF MALT

Is recommended to physicians for its **purity** and **superiority** over all others. It is perfectly free from **Alcohol, Carbonic Acid and Empyreumatic Products**, which can only be attained by the **most careful manipulations** in its manufacture, **long experience**, and by means of **unexcelled apparatus.** Mr. Ed. Loeflund, of Stuttgart, Germany, manufactures only Malt preparations, devotes his whole time to these; and being a thorough Chemist, makes a preparation based upon **scientific principles.** For this reason his Preparations were awarded a **prize** at the **Centennial Exhibition. Loeflund's Concentrated Extract of Malt** is a **Resolvent Emollient** and most powerful **Nutrient.** It is used for diseases of the **respiratory organs, pulmonary complaints,** and for diseases originating in **imperfect digestion.** **Price per bottle, 75 cents.**

Loeflund's Extract of Malt with **Pyrophosphate Iron.**
" " " **Citrate Iron and Quinine.**
" " " **Iodide Iron.**
Loeflund's Extract of Malt with **Hypophosphite Lime.**
" " " **Pepsin.**
" " " **Hops.**

Each of these **$1.00 per bottle.**

Loeflund's Concentrated Leibig's Food for Infants (Leibig's Soup for infants in a concentrated form), **ready for use,** has been pronounced by the Judges of the Centennial Exhibition: **A perfect Substitute for Mother's Milk,** and therefore awarded a prize. Price, 75 cents per bottle.

Circulars giving full particulars will be mailed to all parts upon application.

CAUTION TO THE TRADE AND PUBLIC.—The labels on Loeflund's Preparations should be carefully examined. The signature of ED. LOEFLUND appears on the right lower corner of the genuine label; in the centre, the *Trade-Mark*; and on the *left lower corner*, the words: Sole Agent for America, ALBERT C. DUNG, Druggist, 61 Bowery, New York.

The genuineness of these only is guaranteed. All labels are printed in the *English Language.*

Loeflund's Extract of Malt Lozenges contain a large proportion of **Extract of Malt,** and are **very efficacious,** as well as highly agreeable **Cough Lozenges.** Price 25 cents per package.

All the above preparations are kept by the leading druggists. Orders by mail promptly filled by

ALBERT C. DUNG, 61 Bowery, New York.

NEW HYPODERMIC SYRINGES.

Fig. 48.—No. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German Silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the graduation of doses.

No. 3, Compact, has hollow piston-rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold: they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

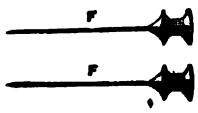
Prices: No. 1, **$4.00.** No. 2, **$4.50.** Postage, .03.
" No. 3, **3.00.** No. 4, **4.00.** " .02.

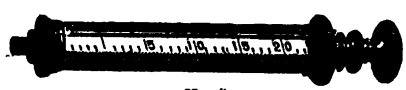
No. 3.

These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINGES.

No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case, ... $3.00 *Postage.* .02

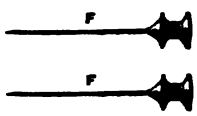




No. 9.

Postage.

No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, two best steel gilt needles, in neat case, $3.00 .02
No. 7 or No. 9, with two steel unplated needles, either, ... 2.50 .02
No. 10, glass, Luer's (French), graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet-lined morocco case, ... 12.00 .02
No. 11, glass cylinder, fenestrated, nickel-plated metal mounting (see cut).



No. 11.

As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and, for those who prefer glass, is recommended for its non-liability to breakage. Price, with two best steel gilt needles, in a neat case, ... $3.50 *Postage.* .02

☞ *Any of the above will be sent by return mail on receipt of price and postage.*

HYPODERMIC SYRINGES OF ALL KINDS PROMPTLY REPAIRED.

Our new **Illustrated Catalogue of Surgical Instruments,** also a new Pamphlet on Inhalation of Atomized Liquids, by distinguished medical authority, with many valuable formulas, will be forwarded, postpaid, on application.

TO THE MEDICAL PROFESSION.

MALTINE.

(EXTRACT OF MALTED BARLEY, WHEAT AND OATS.)

THIS PREPARATION CONTAINS FROM THREE TO FIVE TIMES THE MEDICINAL AND NUTRITIVE ELEMENTS FOUND IN EXTRACT OF MALT.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat* and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST: In the manufacture of ***MALTINE*** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates and Albuminoids on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity possessing little virtue aside from the saccharine matter which it contains.

SECOND: *Carbon, Hydrogen, Nitrogen, Phosphorus, Sulphur, Iron, Magnesium* and *Potassium* are essential elements in the food of man; and it is only in ***MALTINE***, containing the combined properties of malted *Barley*, *Wheat* and *Oats* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD: *Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. ***MALTINE*** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH: LIEBIG says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley in the manufacture of ***MALTINE*** is that it contains larger proportions of mineral matters (bone pooducers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of ***MALTINE,*** *and would request a trial and comparison of merits with any article offered for similar uses.*

MALTINE AND ITS COMPOUNDS

Can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, Imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULAS AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**
This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOS. IRON AND QUINIA:**
A powerful general and nutritive tonic.

***MALTINE* WITH PHOS. IRON, QUINIA AND STRYCHNIA:**
A powerful nutritive, general and nervous tonic.

***MALTINE* WITH HYPOPHOSPHITES:**
This preparation is specially indicated in Phthisis, Rickets and deficient Ossification.

***MALTINE* WITH PEPSIN AND PANCREATINE:**
One of the most effective combinations in Dyspepsia, Cholera Infantum and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE***. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**
One of the most valuable combinations in cases of general Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH COD LIVER OIL:**
The most perfect emulsion, and most agreeable and effective mode of administering this nauseous but valuable Oil yet discovered.

***MALTINE* WITH COD LIVER OIL AND PHOSPHORUS:**
In this combination the Phosphorus has no irritant effect upon the stomach.

***MALTINE* WITH COD LIVER OIL AND IODIDE OF IRON:**
This is prepared with the tasteless Iodide of Iron, which undergoes no chemical change from contact with the Oil, and does not blacken the teeth.

***MALTINE* WITH ALTERATIVES:**
In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.
Each fluid ounce contains: *Chloride Calcium*, 10 grains; *Chloride Magnesium*, 10 grains; *Bromide Sodium*, 5 grains; *Iodide Potassium*, 1 grain; *Iodide Iron*, ¼ grain. Dose, One teaspoonful to one tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only*.

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in amber bottles holding sixteen fluid ounces; each bottle inclosed in a folding paper box.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of **CASWELL, HAZARD & CO., New York,** and of all respectable Chemists throughout the world.

DISEASES

OF THE

URINARY ORGANS,

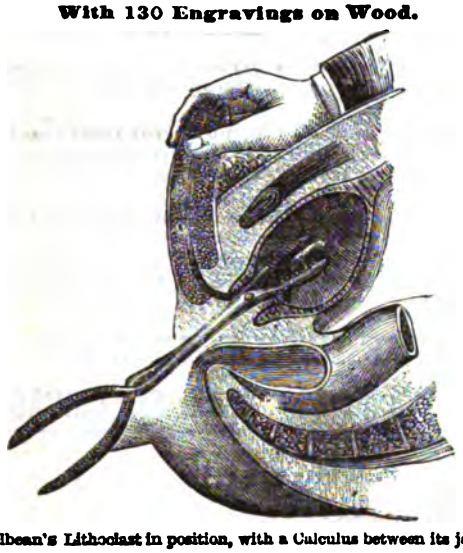
INCLUDING

Stricture of the Urethra, Affections of the Prostate, and Stone in the Bladder.

By J. W. S. GOULEY, M.D.,

Late Professor of Clinical Surgery and Genito-Urinary Diseases in University of New York; Surgeon to Bellevue Hospital, etc., etc.

With 130 Engravings on Wood.



Dolbeau's Lithodiast in position, with a Calculus between its jaws.

In one handsome octavo volume, bound in extra muslin. Price, $3.75.

COMMENTS OF THE PRESS.

"Dr. Gouley's abilities as a practitioner are unquestioned, his success as a teacher also has been amply proved, and the present work gives evidence, both in matter and in style, that he is entitled to rank equally high as a clear and instructive writer."—*Popular Science Monthly.*

"This excellent work purports to be upon diseases of the urinary organs. It has, however, a more particular reference to the surgery of those organs, and, upon a casual reading, seems to be a full and complete *exposé* of such matters."—*Ind. Journal of Medicine.*

"We are glad to welcome this contribution to American surgical literature. It is not so exhaustive as the treatises of Sir Henry Thompson on Stricture and on Lithotomy, nor does it pretend to be, but it is a very clearly-written and practical guide, and will be found useful to a large class of readers. Its mechanical execution is very creditable, and it contains remarkably few typographical errors."—*Philadelphia Medical Times.*

"Having on different occasions, during the last six years, enjoyed the privilege of witnessing the performance by Prof. Gouley of some of the most difficult and important operations on the genito-urinary organs, and having been profoundly impressed with his consummate skill and ability as a practical surgeon, we hailed with eagerness the promise of a monograph from his pen on a class of diseases to which he had given special attention. * * * * * No practitioner who undertakes the treatment of the urinary organs can afford to be without it. It will, we are confident, give him a high position among the recognized authorities in the specialty with which his name has been for some years honorably associated."—*Chicago Medical News.*

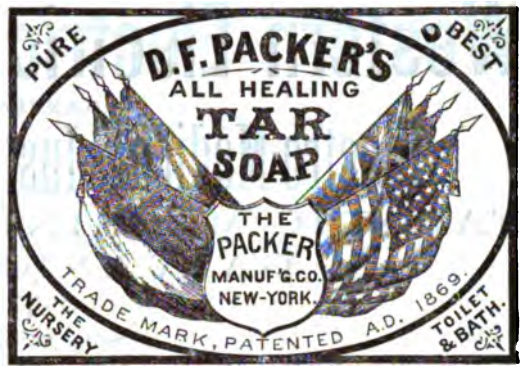
WILLIAM WOOD & CO., Publishers,

27 Great Jones Street, New York.



This soap is confidently offered to the medical profession and the public, as being a detergent, which, from the nature of its composition, possesses UNDOUBTED HEALING QUALITIES.

It is a preparation of useful VEGETABLE OILS, CHEMICALLY PURE GLYCERINE AND REFINED PINE TAR, in which EVERY INGREDIENT IS THOROUGHLY SAPONIFIED by a process peculiar to ourselves. We thus produce a detergent absolutely free from the valid objections frequently discoverable in soaps compounded from animal fats, which HAVE BEEN KNOWN to be POSITIVELY INJURIOUS TO THE SKIN.

This soap has already been used in many public institutions: as Nurseries, Infant Asylums, Hospitals, Dispensaries, etc., and abundant evidence, from them and from private physicians, can be given those desiring it, which will bear out all that is claimed for the remedial excellence of PACKER'S TAR SOAP.

In the treatment of

DISEASES OF THE SKIN,

this soap is of especial service: first, because while other soaps, if used, may and probably will exercise some injurious effect, this is the *least irritating of all* soaps; and second, because by virtue of its TAR and GLYCERINE, of which it contains a very large percentage.

SURGEONS find it the best soap for cleansing wounds, ulcers, etc., and for antiseptic and deodorizing purposes.

We feel the utmost confidence that the expectations of the physician will be uniformly realized, if a little pains is taken to designate PACKER'S in cases where TAR SOAP is indicated.

The Packer M'f'g Co.,

Western Electric Manufacturing Co.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,

GALVANIC BATTERIES,

BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8¼ x 7¼ x 4¼. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

NELATON'S CATHETERS,

Sometimes called Jacques', but really the invention of Dr. Nelaton, Surgeon to the late Emperor Napoleon III., have, by their decided advantages over every other kind, become a necessity in the practice of the leading Physicians and Surgeons of Paris, London, and other European Cities.

Their introduction here has been so successful that imitations are already in the market, much inferior in quality. Having secured a large stock from the original manufacturers during my stay in Paris, I am enabled to offer the genuine at a reasonable price.

These are made of *pure brown rubber*, with a smooth, soft surface, delicately flexible; and if the simple directions on the box are followed, their introduction will cause little or no pain, and effect their purpose much more easily and effectively than any other kind.

Sets of nine sizes, numbered and with wire, the whole neatly boxed, will be sent by mail on receip of $6.00. THEO. RICKSECKER, 146 & 148 WILLIAM ST., NEW YORK.

Please mention MEDICAL RECORD.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine. Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3¼ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Send for Price List.

LAZELL, MARSH & GARDINER'S POWDERED MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, chance, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory, and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them.

Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts.*

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.		per oz.
Powd. Ext. Aconite Leaf	.40	Powd. Ext. Jalap	.40
Powd. Ext. Aloes	.40	Powd. Ext. Lobelia	.40

CHAMPION SPOUTING SPRING NATURAL WATER FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast.

and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties: it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case $9 00
Quarts, 2 dozen in a case 7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case $8 00
Quarts, 2 dozen in a case 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.,** or to the Company's office, **205-213 E. 12th St., New York,** will receive prompt attention.

In corresponding with Advertisers please mention **The Medical Record.**

SOLUBLE TABLETS, TABLET TRITURATES, PILL & TABLET SATURATES

MADE ACCORDING TO DR. ROBERT M. FULLER'S METHOD.

These tablets, from their ready solubility or diffusibility, are destined to come into general use in the profession. Their advantages can be appreciated at once when they are allowed to dissolve in the mouth or in a teaspoonful of water. They are readily soluble in the mouth or stomach, or diffusible in a teaspoonful of water, and thus administered.

We make the following abstract from an address read by Dr. ROBERT M. FULLER. before the New York Academy of Medicine, and published in "The Medical Record" March 9th, 1878, in which he makes known an accurate method he has devised for dispensing certain medicines in separate doses, in a compact and palatable form:

"The inability frequently experienced by physicians to obtain certain medicines, in separate doses, of a desired formula and mode of preparation led me, some time ago, to undertake a series of pharmaceutical experiments with a view of contriving some simple, inexpensive and readily available method of preparing the medicines so desired."

"After a number of varied and careful experiments, I succeeded in devising four methods of preparation."

"The preparations in question I have named *soluble tablets, tablet triturates*, and *pill* and *tablet saturates*, the former being designed for any powders which are to be administered in certain required doses, and the latter for certain fluid extracts, or other standard concentrated solutions."

"*Physicians practising in the country, to whose use they are adapted by reason of their economy, dose-accuracy, compactness, and palatable form for dispensing, will find them almost indispensable.*"

"The SOLUBLE TABLETS generally consist simply of certain medicines made into soluble paste with the aid of sugar of milk, and alcohol, or water. The tablets are intended to embrace any medicines that can be made into a paste which is not too tenacious, such as fluid extracts, or sugar of milk containing any per cent. of chemical, such as arsenious acid, sulphate of morphia, muriate of ammonia, etc."

"The TABLET TRITURATES consist of triturations of metallic, mineral, and vegetable medicines. These triturations, with sugar of milk, are mixed with alcohol of any per cent., or water, according to the adhesiveness required, and the paste thus formed is then readily made into tablets of any size."

"The TABLET SATURATES are merely porous troches, or tablets designed for saturation. The difference between the tablets and the pills, beyond the difference in shape, being that the former will absorb a much larger quantity of fluid extract, or other standard concentrated solution, than the latter."

"The PILL SATURATES possess two favorable qualities, namely: they are made easily, and at an extremely low cost. Either of the above are of various sizes, and sold by the ounce or pound, for medication."

☞ We have these tablets either medicated or plain, for medication, and can supply physicians with them. Medicated according to any formula desired, and will make special rates when 100 or upwards are ordered.

CASWELL, HAZARD & CO.,

Fifth Ave., cor. 24th St.; & Sixth Ave., cor. 39th St., New York.

PHOSPHORUS COMPOUNDS

AND OTHER NEW ADDITIONS TO

McKesson & Robbins' Gelatine-Coated Pills.

PHOSPHORUS, DIGITALIS & EXT. HYOSCYAMUS,

Phosphorus	1-50 gr.
Pulv. Digitalis,	1 gr.
Ext. Hyoscyami,	1 gr.

Pronounced a valuable medicine as a heart tonic. The tonic effect of Digitalis on the involuntary muscular fibre is claimed to be analagous to that of Strychnine on the involuntary muscular system. Dose, 1 pill two or three times a day, at equal intervals, which should be ommitted when effect is produced upon the head, stomach, pulse or kidneys.

PHOSPHORUS & EXTRACT ACONITE,

Phosphorus,	1-50 gr.
Ext. Aconiti Alc.,	1-16 gr.

A combination recommended by an eminent English physician in the treatment of Phthisis with Pyrexia. Dose, 1 pill every four hours.

PHOSPHORUS & EXT. CANNAB INDIC.,

Phosphorus,	1-50 gr.
Ext. Cannab Ind.,	1-4 gr.

A good narcotic, when Morphia should not be administered, and recommended as an aphrodisiac in the place of Nux Vomica. Dose, one or two pills two or three times a day with food.

PHOSPHORUS, Ext. NUX VOM. & Ext. ALOES,

Phosphorus,	1-50 gr.
Ext. Nucis Vomicæ,	1-4 gr.
Ext. Aloes Soc.,	1-2 gr.

A good dinner pill, useful in atonic dyspepsia, hypochondria and other nervous affections accompanied by habitual constipation. When, in administering, for some time, Phosphorus and Iron, or Phosphorus and Quinine, constipation is induced, this pill may be substituted with advantage once a day between doses. Dose, one immediately after dinner.

PHOSPHORUS, Ext NUX VOM. & CARB. IRON,

Phosphorus,	1-50 gr.
Ext. Nucis Vomicæ,	1-4 gr.
Ferri Carb,	1 gr.

Dose, one or two pills at each meal with food.

PHOSPHORUS IRON & ALOES,

Phosphorus,	1-50 gr.
Ferri Sulph. Exsic.,	1 1-2 grs.
Ext. Aloes Soc.,	1 gr.

PHOSPHORUS, MORPHIA & VAL ZINC.

Phosphorus,	1-50 gr.
Morphiæ Sulph.,	1-12 gr.
Zinci Valerianas,	1 gr.

Recommended as a quieting influence in Phthisis when there is hysterical irritability and hacking cough without much fever. Dose, one pill two or three times daily, or two upon going to bed.

PHOSPHORUS, NUX VOMICA & CANTHARIDES,

Phosphorus,	1-50 gr.
Pulv. Nucis Vomicæ,	1 gr.
Tinct. Canthar. Conc.,	1 minim.

Recommended as a gentle stimulant to the genito-urinary organs, a useful remedy in incontinence and retention of urine, and in premature loss of sexual power. Also successfully prescribed in some cases of Amenorrhœa and Leucorrhœa. Dose, one or two pills two or three times a day with food.

PHOSPHORUS & QUININE,

Phosphorus,	1-50 gr.
Quiniæ Sulph	1 gr.

Physicians can readily see the value of this pill as a nutritive tonic.

PHOSPHORUS, QUINIA, IRON & STRYCHNIA,

Phosphorus,	1-100 gr.
Quiniæ Sulph.,	1 gr.
Ferri Reduct.,	1 gr.
Strychnia,	1-60 gr.

By some preferred to Pills of Phosphates Iron, Quinine and Strychnine.

PHOSPHORUS & STRYCHNIA,

Phosphorus,	1-50 gr.
Strychnia,	1 60 gr.

PHOSPHORUS SULPH., ZINC, & LUPULIN,

Phosphorus,	1 50 gr.
Zinci Sulphas,	1 gr.
Lupulina,	1 gr.

***ALL* of McKesson & Robbins' Gelatine-Coated Pills can be found at my Pharmacy.**

T. H. SAYRE, Dispensing Chemist, 6th Av., cor. 46th St., New York.

On receipt of $1.00, I will mail to Country Physicians Samples of ANY or ALL kinds of the above pills as they may direct.

NOTICE.—See our Advertisement, page 3.

Extract of Malt

WITH

COD LIVER OIL.

Our Improved Extract of Malt with 50 per cent of our fine Norwegian Oil, is pre-eminently THE emulsion of Cod Liver Oil, since it *has double the nutritive effect of any other emulsion of oil.* It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or gramiaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that IT UNITES PERFECTLY WITH WATER IN ANY PROPORTION, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

DOSE.—A Dessert to Tablespoonful immediately after Meals.

Prepared with the most scrupulous care

KEASBEY & MATTISON,

" Ferri Pomate. " " " "						$1 00

Price inclusive of jars and bottles.

MATHIAS ROZSNYAY.

Arad, Hungary,

Begs leave to inform the Medical Profession that he has given his sole agency and the exclusive control of his preparation of

TASTELESS QUININE,

Neutral Tannate of Quinine,

To Mr. F. ALFRED REICHARDT, who keeps full stock of his preparations.

The discovery of Mr. Math. Rozsnyay to make an *absolutely tasteless and reliable* preparation of Quinine is one of the most important in modern therapeutics. The ordinary Tannate of Quinine, as made in chemical works, is obtained by precipitating the mother liquor, of which Quin. Sulphate has crystallized out, by an addition of Tannic Acid. First, this is an acid, or bi-tannate, and contains likewise all the other Cinchona Alkaloids, Quinidia, Cinchonidia, Cinchona, Quinicin, etc., the little intrinsic value of which is best proven by the price lists of large German manufacturers who quote this salt at only one-sixth of the value of the Sulphate. The *neutral* Tannate of Quinia has also great advantages over the Sulphate, as it does not cause the same cerebral and digestive troubles, as has been fully proved by the report of the commission appointed by the Academie de Medicine, in Paris, on a memoir presented by Mr. Bonesicre. The commission consists of Messrs. Orfila, Bussy & Bouvier; their names are sufficient proof for the thoroughness of their researches.

I guarantee that this Neutral Tannate contains in 2½ grains the same percentage of pure Quinine as is contained in 1 grain of the Sulphate, and that its effects in equivalent doses are the same as that of the Sulphate. In treatment of diseases of children and persons of delicate taste, it is of the highest value. It is also put up in Chocolate Lozenges, containing each 2½ grs. of Tannate, 2 doz. in a box. Pamphlet sent free on application. Price per box, $1.00. Per ounce, $3.00.

GANOT'S PHYSICS.

An Elementary Treatise on Physics, Experimental and Applied. For the use of Schools and Colleges. Translated and Edited from Ganot's "Eléments de Physique," with the author's sanction. By E. ATKINSON, Ph.D., T.C.S., Professor of Experimental Science, Royal Military College, Sandhurst.

In one thick large 12mo volume of over 900 pages, profusely illustrated by Chromo-lithographic Plates, and 762 fine wood engravings. Price $5.00.

The Publishers take pride in offering this beautiful work of Prof. Ganot. It has no rival, we believe, in the English language. It is fully up to the times in every particular, and no expense has been spared to make it typographically a model text-book. As a book for the library of the scholar and gentleman it is invaluable, giving concise information on every branch of Physical Science.

Sent by mail, post-paid, on receipt of price.

WM. WOOD & CO., Publishers, 27 Great Jones Street, New York.

LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.

The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***

Fig. 1. Pat. Dec. 2, 1873.

PRIVATE INSTRUCTION IN

PRACTICAL GYNECOLOGY

At MT. SINAI HOSPITAL, OUT-DOOR DEPARTMENT,

By PAUL F. MUNDE, M.D.,

For graduates only. Course 12 lessons of two hours each. Fee $30.00. For further information, apply to

DR. MUNDÉ, 20 West 45th St., New York.

An increase of 200 pages additional Reading Matter in a year will be made in

THE AMERICAN JOURNAL OF OBSTETRICS

And Diseases of Women and Children.

PAUL F. MUNDÉ, M.D., Editor.

In consequence of the great increase in the number of subscribers to the AMERICAN JOURNAL OF OBSTETRICS the past year or two, the Publishers take pleasure in announcing that, beginning with January, 1878 (Vol. XI. No. 1.), they will permanently increase each number by *fifty additional pages*, thus giving its subscribers annually about

ONE-THIRD MORE READING MATTER

than heretofore, or, a volume of 896 large octavo pages with *no change in the subscription price.*

An increased number of illustrations, both wood engravings and lithographed plates, may also be expected in future volumes.

While the prosperity of the AMERICAN JOURNAL OF OBSTETRICS, and this consequent substantial evidence of it, cannot fail to be gratifying to all its subscribers and other friends, the Publishers trust the Medical Profession will take this voluntary action on their part as an earnest of their desire and intention, so far as in their power, to make all their publications merit the liberal support which is given them.

Subscription Price, $5.00 per year, invariably in advance.

☞ If any subscriber has a friend to whose notice he would like to commend the Journal, the Publishers will be pleased to mail a Specimen Copy to any address furnished them.

LESSONS IN
Physical Diagnosis.

THIRD EDITION. REVISED AND ENLARGED.

In one handsome octavo volume, cloth, $3.00.

NOTICES OF THE PRESS.

"The previous editions of this volume have been very well received, and, from their ready sale, appear to meet a well-recognized want. . . . We find the plan of the work excellent, and, within the limits proposed by the author, very well carried out. It would be easy to point out many omissions; completeness and conciseness to a certain degree exclude each other; but in the space assumed, it would be difficult to include a greater variety and amount of sound teaching. The style is compact, clear, positive, and exact. It is free from all irrelevant discussions; nothing is allowed to disturb or confuse the distinct image of clinical facts. . . . The book is very creditable to its acute and industrious author; and whoever shall practically master its contents cannot fail to be a discriminating and well-furnished diagnostician"—*The Medical Record.*

"For students it is the best work on physical diagnosis that is published."—*Detroit Review of Medicine.*

"This is a work already well and favorably known to the profession. In the present edition the original text has been entirely revised and enlarged by the addition of five new lessons."—*Chicago Medical Examiner.*

"Students of medicine and practitioners will find this just the work to meet their wants on the subjects of which it treats. Its instructions are full and very plain."—*Cincinnati Medical News.*

"The previous editions of the work, confined to an exposition of the subject of physical exploration of the chest and abdomen, we have regarded as among the very best works on the subject extant, and hence recommended 'Loomis on Physical Diagnosis' to our classes; and it gives us pleasure to repeat, in this form, our hearty commendation of the book."—*Mich. University Medical Journal.*

LECTURES ON
Diseases of the Respiratory Organs,
HEART AND KIDNEYS.

In one handsome octavo volume of over 550 pages. Price, in extra muslin, $5.00; *or, in leather,* $6.00.

NOTICES OF THE PRESS.

"It is clear in style, convential in arrangement, very definite and practical in its teachings."—*Philadelphia Medical Times.*

"We like the systematic method in which these lectures are arranged, and regard them as excellent in every way."—*Cincinnati Lancet and Observer.*

"By all means buy Loomis' work and *study* it."—*Ohio Medical and Surgical Reporter.*

"In the one before us the reader may look confidently for the last words on the subject, and may rest assured that what the author has here committed to the press is the result of much learning, sound judgment, and thorough experience"—*American Practitioner.*

"We have no hesitation in pronouncing it one of much value to the profession, and highly creditable to the author."—*New York Medical Journal.*

"While the views presented are fully up to what is actually known on the subjects treated, the doctrines are judicious and safe. At the same time they are presented with unusual clearness, and with sufficient positiveness to command confidence."—*New Orleans Medical and Surgical Journal.*

LECTURES ON
FEVERS.

In one handsome octavo volume. Cloth, $4.00; *Sheep,* $4.75.

NOTICES OF THE PRESS.

"We have before us, therefore, a book containing statements of practical facts relating to certain diseases, and the theories regarding their nature, mode of origin and propagation, and arranged so as to be easily comprehended by the medical student. We also believe they will be read without weariness by the daily practitioner. . . . It contains much practical knowledge, and cannot fail to be read by a very large proportion of the medical profession; for a concise statement of facts—with only such qualifications as can be safely indulged in without endangering perspicuity—is always acceptable."—*The Medical Record, Nov.* 24, 1877.

"This last work of Professor Loomis' is a valuable contribution to medical literature. His treatment of the subject is mainly practical, and is in strict conformity with what the author has himself observed at the bedside. The general management of fever is justly regarded of greater importance than the administration of drugs. It is a book that will well repay careful study."—*Western Lancet, January,* 1878.

"The work is clearly and concisely written, and will be useful and acceptable to both student and practitioner."—*N. Y. Medical Journal, March,* 1878.

"In this interesting volume, which contains the lectures on fevers delivered by Professor Loomis to his class during the last year, we have a concise and impartial review of the literature concerning fevers, which has been published since 1850 with reference to a few older books, 'because they contain many of the so-called new theories and modes of treating fevers.' In this are embodied the results of the author's own extensive clinical experience, which has led him to form opinions in certain respects at variance with those of some other observers; and the weak points of theories and modes of practice which have not stood the test of time, are clearly set forth."—*Boston Medical and Surgical Journal, Dec.* 22, 1877.

TO PHYSICIANS.

THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, i. e., the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution**, which is generally preferred; or of an **elixir**, when a slight stimulant is desired.

Durel's Syrup of Tar and Iron.

Prepared by DUREL, Pharmacist, Paris.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron, is a desideratum which has at last been attained in this preparation. The indications for such a remedy are many, but it has been found especially useful in *Chlorosis, Bronchial Catarrh, Catarrh of the Bladder, Chronic Uterine Discharges*, depending upon an enfeebled or relaxed state of the system.

It is sold by chemists generally.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of **Ether; Chloroform; Oil of Turpentine; Apiol;**
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

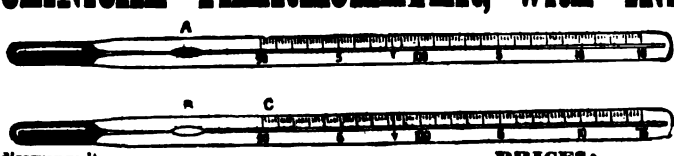
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Pharmacien, No. 40 Rue Bonaparte, Paris, without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... $7 00

We also offer:

No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... 5 00

No. 1. Casella's Clinical Thermometer for Hospital use, four or six inch, in neat pocket case..... 3 50

Sent free by mail on receipt of price. Manufactured by L. CASELLA, London.

E. FOUGERA & CO., Agents, 30 North William St. New York.

Works on Materia Medica and Therapeutics.

THE ESSENTIALS OF MATERIA MEDICA AND THERAPEUTICS.

By ALFRED BARING GARROD, M.D., F.R.S., Fellow of the Royal College of Physicians, etc., etc.

Second edition, revised and much enlarged. One handsome 8vo volume, extra muslin. Price $4.00.

"The work of Dr. Garrod supplies a want that has long been felt on this side of the Atlantic. The editor has confined himself to supplying a few of the omissions of Dr. Garrod, and to indicating where a difference exists in the preparations of the Pharmacopœia of the United States. His aim has been to make such additions only as are strictly necessary for the American student.

"The author of this book has succeeded admirably in placing in concise form what is necessary to be known of Materia Medica and Therapeutics, leaving it to larger works to enter into details."—*Medical and Surgical Reporter.*

"We have here a brief *résumé* of Materia Medica, all non-essential parts being omitted. It might be called a commentary on the Pharmacopœia, as it somewhat resembles Phillips' commentary on the London Pharmacopœia, though more extended in its descriptions of the action and uses of remedies."—*Eclectic Medical Journal.*

A YEAR-BOOK OF THERAPEUTICS, PHARMACY, AND ALLIED SCIENCES. 1872 & 1873.

By H. C. WOOD, Jr., M.D.

In handsome octavo volumes, bound in extra muslin. Price $2.50 *each.*

This "Year-Book" is made up from the pages of "New Remedies," and contains all the more important articles which have appeared in that journal during the past year, together with a few new ones. It will be published annually for the benefit of those who prefer to purchase the very valuable material it contains in this form rather than in unbound numbers as a periodical. A complete index has been added.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS.

By SIDNEY RINGER, M.D., Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price $4.50.

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"The author, as we have said, designed the book simply as an introduction to Therapeutics for the use of students and young practitioners. That to such it will be found most useful there is no doubt; but we are also sure that from the mass of valuable, readable, and well-arranged information it contains, and the numberless minor practical hints scattered throughout its pages, the work will be almost equally useful to the busy practitioner; and that it will receive from the profession generally the warm welcome which it deserves."—*British Med. Jour.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on therapeutics."—*St. Louis Med. and Surg. Journal.*

THE ELEMENTS OF THERAPEUTICS.

A CLINICAL GUIDE TO THE ACTION OF MEDICINES.

By Dr. C. BINZ, Professor of Pharmacology in the University of Bonn.

Translated from the Fifth German Edition, and edited, with additions, in conformity with the British and American Pharmacopœias.

By EDWARD I. SPARKS, M.A., M.B., Oxon.

Member of the Royal College of Physicians of London, Officier de Santé (Alpes Maritimes), France, formerly Radcliffe Travelling Fellow.

In one handsome 12mo volume, bound in extra muslin, price $2.00. *Sent by mail, free of postage, on receipt of price.*

"This work contains much valuable information, especially in regard to those remedies which exert an influence on the nervous system."—*St. Louis Med. & Surg. Journal, Feb.*, 1878.

"The desire to know how a medicine acts is just beginning to attract the attention it deserves. This work gives a clear description of the therapeutical action of medicines in a way that is sure to command attention and cause a more thorough investigation in this branch."—*Cincinnati Lancet and Observer, Feb.*, 1878.

"The work appears to have been written with great care, and bears the impress of reliability; and is a volume that we do not hesitate to recommend in the strongest manner."—*The Medical Record, Jan.* 12, 1878.

"The book is in every respect excellent. It is a judicious condensation of practical, useful facts, educed from physiological experiment and clinical observation."—*Am. Practitioner, Feb.*, 1878.

"The most striking features of the work are the conciseness with which the author expresses what is known on each subject, and a style which gives the subjects a freshness not commonly found in text-books on therapeutics, or in lectures on this topic."—*New Remedies, Jan.*, 1878.

"It is, on the whole, more trustworthy than the average text-book. In fact there is little in it that should be neglected by the medical student. We regret that such a work was not available during our own student days."—*Detroit Lancet, Feb.*, 1878.

STUDIES IN ATHOLOGY AND THERAPEUTICS.

By SAMUEL HENRY DICKINSON, M.D., LL.D., Professor of Practice of Physic in Jefferson Medical College, Philadelphia, etc., etc.

In one handsome 12mo volume, neatly bound in extra muslin. Price $1.50.

"Mr. Dickson may be styled a medical philosopher, in the best sense of the term. He thinks independently, and has done a vast amount of good thinking in the 200 pages composing the 'Studies.' There are few writers who find the *middle way* so successfully. He shows no bigoted affection for the old, nor any shallow, pedantic passion for the new. We give his book a hearty recommendation to our medical brethern. They will rise from its perusal informed and refreshed."—*Pacific Medical and Surgical Journal.*

ESSAYS ON INFANT THERAPEUTICS.

To which are added Observations on Ergot; History of the Origin of the Use of Mercury in Inflammatory Complaints; with the Statistics of the Deaths from Poisoning in New York, in the Years 1841-2-3.

By JOHN B. BECK, M.D.

Third Edition. One very neat duodecimo volume, muslin. Price $1.00.

"A neat gem. We regard it as one of the most useful books in our library."—*New Jersey Medical Reporter.*

"An excellent little work, from the very highest authority."—*Western Lancet.*

Sent by mail, post-paid, on receipt of price.

Professor of Gynæcology.
HENRY G. PIFFARD, M.D.,
Professor of Dermatology.
A. E. MACDONALD, M.D.,
Professor of Medical Jurisprudence.
JOSEPH W. HOWE, M.D.,
Clinical Professor of Surgery.

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 19, 1877, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Third of October, 1877, and end about the 1st of March, 1878.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted *to all the Clinics* given therein, *free of charge.*

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Demonstrator's fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

For further particulars and circulars, address the Dean,

Prof. CHAS. INSLEE PARDEE, M.D.,

University Medical College, 410 East 26th St., New York City.

FOUGERA'S COMPOUND IODINIZED

COD LIVER OIL

Since the introduction of this oil in 1868 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

E. FOUGERA, Pharmacist,

Medical Pictures and Portraits
For PHYSICIANS' OFFICES.

Harvey Demonstrating the Circulation of the Blood

A fine photograph, from a valuable engraving.

Size, 7x9 inches, on fine white mount, 13x16. Price, $1.50
Size, 15x18 " " " 22x28. " 4.00
The engraving of the above is entirely out of print.

THE ANATOMICAL LECTURE.

(After Rembrandt.)

A fine photograph, in both size and price same as Harvey, making a fine companion picture.

THE ANATOMIST.

From a painting by the great artist Max of Germany.

It represents a Professor in deep study, sitting by the side of a female subject of great beauty.

A Fine Etching, Proof Copies. Price, $1.25

JENNER VACCINATING A CHILD

Photograph.

Size, 8½x10 inches, on fine white mount . Price, $1.50.

AMBROISE PARÉ.

To this celebrated French surgeon is attributed the introduction or first use of Ligatures, instead of the old mode by the actual cautery. It represents an operation on the leg of a soldier on the battle-field, surrounded by several eminent men who are looking on with great interest. This engraving, now very scarce and rarely found, has been published in fine Photograph, in three sizes, viz.:

7x9 inches, on white mount, 15x16. Price, $1.50
15x18 " " " 22x28. " 4.00
7x18 " on granite " 11x19. " 2.00

HIPPOCRATES.

A fine photograph from an old and valuable engraving.

Size, 11x14 inches. Price, $1.00.

PHOTOGRAPH PORTRAITS OF

(Imperial Size)

SIR ASTLEY COOPER,
DR. JOHN HUNTER,
DR. RICHARD BRIGHT.
} Price, 50 cents each.

THE LUNATIC ASYLUM.

This remarkable picture by KAULBACH, represents a scene in the yard of a Mad-House. A group of unfortunates, each one occupied with the ideas of his own fancy. One as a king, another as a miser, and so on. As a composition and study, it is one of great interest.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

ANDRÈ VÈSALE.

A picture of this celebrated anatomist, at work in his attic, listening to approaching footsteps.

Size, 7x9 inches, on white mount, 13x16. Price, $1.50.

Prof. CHAS. A. BUDD.

A photograph from life of the late Prof. C. A. Budd, and the only portrait approved of by himself and family. A fine likeness.

Imperial size, from life. Price, 50 cents.

OTHER PHOTOGRAPHS ARE IN PREPARATION.

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1877-'78.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1877-1878 will open on Wednesday, September 19, 1877, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 3, 1877, and end about the 1st of March, 1878.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery, Fractures and Dislocations, and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of Clinical and Operative Surgery.
WM. T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
EDMUND R. PEASLEE, M.D., LL.D., Professor of Gynæcology.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Lecturer on General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL. D., Professor of Psychological Medicine and Medical Jurisprudence.
EDWARD L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
EDWARD G. JANEWAY, M.D., Professor of Practical Anatomy. (Demonstrator of Anatomy).
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.
A. A. SMITH, M.D., Lecturer Adjunct upon Clinical Medicine.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

See Advertisement of New Formulas in last week's issue, page 5.

McKESSON & ROBBINS' GRANULES, Gelatine-Coated.

Aconitia.....1-60 gr.	**Mercury, Proto-Iodide**....1-5, 1-4, 1-2 gr.
Arsenious Acid.....1-50, 1-40, 1-30, 1-20 gr.	**Morphia, Acetate**.....1-8, 1-4 gr.
Atropia.....1-60 gr.	**Morphia, Sulphate** 1-16, 1-10, 1-8, 1-6, 1-4 gr.
Belladonna Extract.....1-4 gr.	**Morphia, Valerianate**.....1-8 gr.
Calcium, Sulphide.....1-10 gr.	**Podophyllin**.....1-8, 1-4 gr.
Codeia.....1-16, 1-5 gr.	**Quinia**.....1-2, 1-4 gr.
Corrosive Sublimate....1-40, 1-30, 1-20 gr.	**Strychnia**.....1-60, 1-40, 1-30 gr.
Digitalia.....1-60 gr.	**Sulphur, Iodide**.....1-25, 1-10 gr.
This is prepared in our own laboratory and can be confidently relied upon.	**Tartar Emetic**.....1-100, 1-20, 1-4 gr.
Mercury, Bin-Iodide.....1-25, 1-16 gr.	**Zinc, Phosphide**.....1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

Quote MEDICAL RECORD.

SOLUBLE PILLS.

170 WILLIAM STREET, NEW YORK, October, 1876.

THE marked increase during the past few years in the demand for Pills made in accordance with the U. S. Pharmacopœia and other recognized formulas, has induced us to commence their manufacture in our own laboratory, and we are now furnishing Coated Pills, which, for beauty of finish, solubility, and general excellence, are unequaled.

The best substances are used in their manufacture. No article required by a formula is omitted on account of its high cost, nor are any pills deficient in weight; so that we can guarantee them to be made in strict accordance with the standard formulas, *both as regards the materials called for and in weight.*

The pills are coated while soft, and the excipients employed are such as preserve a mass readily soluble in the juices of the stomach, thus insuring prompt action.

The coating, which is soluble and so transparent as to clearly reveal the color of the mass, effectually covers any nauseous taste, and renders the pill easy to be swallowed. Its solubility can be readily tested by allowing a pill to rest upon the tongue for a few seconds.

Particular attention is called to our Granules of Morphine, Strychnine, Arsenious Acid, and other powerful remedies, which are prescribed in minute doses. The desirability of having these medicines in this shape, accurately weighed and ready for administering, has long been recognized. We have taken every precaution to insure accuracy in weight, and can give assurance that in this, as in other particulars, they can be implicitly relied upon.

We shall be happy to furnish any samples that may be desired.

NOTICE—See our Advertisement in alternate numbers of the RECORD.

W. H. Schieffelin & Co., 170 and 172 William St., New York.

ALOIN, { THE ACTIVE PRINCIPLE OF ALOES.

MANUFACTURED BY THE DISCOVERERS,

T. & H. SMITH & CO., Edinburgh and London.

"The uniformity in strength of Aloin, the smallness of its dose, and the certainty of its action should commend it to the favourable consideration of all medical practitioners."—*Vide* Dr. WM. CRAIG'S Investigations, published in *Edinburgh Medical Journal* for May, 1875.

Messrs. SMITH will send free by post a Sample of Aloin to any Medical Gentleman desiring it.

NEW YORK—Messrs. McKESSON & ROBBINS.

Original Communications.

CLINICAL OBSERVATIONS ON THE EARLY STAGES OF SCARLET FEVER, WITH SUGGESTIONS AS TO PATHOLOGY.

By C. E. BILLINGTON, M.D.,

VISITING PHYSICIAN TO DEMILT DISPENSARY.

(Read before the New York Academy of Medicine, March 7, 1878.)

Part I.

A few special observations now to be presented were made by myself and my assistants on 102 cases of scarlatina, which were visited between January 1, 1877, and February 9, 1878, in the north district of Demilt Dispensary. The general remarks are based on a much larger number seen during a series of years in dispensary and private practice.

I shall also refer to the Demilt Dispensary clinical report of my friend, Dr. W. E. Bullard, visiting physician to the south district, in the *New York Medical Journal* for March, 1878, on 74 cases—it having been agreed between us to make observations on some of the same points.

The earliest fact in the clinical history of scarlatina is the contagion. While this is exceedingly subtile, permanent, and capable of being carried to great distances, it is at the same time known to be uncertain in its effect, even on those who are exposed to its greatest intensity. I availed myself of the facilities at my disposal to test what proportion, in a considerable number of children directly and constantly exposed to the disease, and unprotected by having had it, might yet escape it. This could not be done either in hospital or in private practice, because there the sick are usually at once isolated; but in the apartment of the dispensary patient, the sick and the well remain together, and often sleep in the same bed.

Going over the ground again towards the close of the last year, a census was taken of the children in all the families containing more than one unprotected child, in which cases had occurred during the eight months that followed May 1st, with the exception of one which had moved away and could not be traced. It was found impracticable to go back farther, on account of numerous removals. The numbers in each of twenty-six families, with the ages, are as follows:

No. Attacked.	Ages.	Escaped.	Ages.
1	3	7, 5, 2½	2	10, 16
2	1	14	3	8, 9, 17
3	2	2, 4	1	10 months.
4	1	11 months.	1	4
5	1	1½	1	8
6	2	1½, 2½	0	
7	3	4, 5½, 2½	0	
8	1	5	3	3, 6, 9
9	1	9 months.	2	9, 6
10	1	5	2	10, 3 months.
11	1	5	2	6, 8 months.
12	2	6, 4	4	9, 5, twins 2½
13	1	6	1	3 weeks
14	3	2½, 8, and another before.	0	
15	2	7, 3	5	1½, 5, 11, 13, 17
16	2	7, 10 months.	1	4
17	1	2	4	12, 10, 5, 6 months.
18	2	2, 5	3	14, 7, 3 months.
19	2	5, 3¼	1	6
20	2	4, 5½	0	
21	1	2	2	15, 12
22	1	5	3	10, 8½, 2½
23	1	7	1	5
24	3	7, 6, 3	0	
25	1	2	2	15, 12
26	2	5, 2½	3	8, 6, 2 months.

The totals show that while forty-three children in these families had the disease, forty-seven children who had not previously had it escaped. But, rejecting from the latter list four, aged three weeks, two months, and three months, ages which are usually exempt, leaves, curiously enough, the two totals exactly equal. Two points herein would naturally be challenged: First, had none of these children had the disease before? I reply that the parents were in each instance carefully questioned and cross-questioned, no second-hand statements having been accepted, and the list is probably in that respect nearly correct. Second, where only one or two had it out of a large family of children, as was stated in several instances, was the diagnosis of scarlatina correct? I answer that the disease was in every instance so well marked as to be unquestionable. It was, moreover, in some of them severe, and in one fatal, so that the exemptions were not due to the mildness of the contagion.

In none of these cases was any attempt made at prophylaxis beyond the ordinary use of disinfectants in the apartments. Indeed, this enumeration, which was no very light task, was not undertaken out of mere curiosity, but with reference to the question of prophylaxis. The enthusiastic advocates of belladonna and the sulphocarbolate of soda have published impressive statistics of their successful employment. These results, I believe, have usually been obtained in rural districts, or among the inhabitants of detached residences in cities. Suppose the exemption of fifty per cent. of unprotected children, after constant exposure in the closely crowded families above enumerated, had occurred in connection with the employment of some favorite prophylactic measure. Would it have been possible to deny that it might have had some utility? But had it at the same time been tested upon the other inhabitants of the teeming tenement-houses containing these cases, what an imposing statement of prevented disease might have been advanced! It is with no view to discredit efforts at prophylaxis that these facts and remarks are presented, but simply to suggest a criterion by which to test their results.

INCUBATION.

The interval between the reception of the contagion and the subsequent outbreak of the disease is usually denominated the period of incubation. The generally accepted theory with regard to this is that the contagium having by some route entered the blood, a specific general change, either from organic propagation or purely chemical action, is now taking place in that fluid, the effect of which change is in due time manifest in the occurrence of the characteristic local and general phenomena of the disease.

As this specific primary blood-change has never been demonstrated by microscope or chemical test, it is proper to inquire: Is its existence or its agency a logical necessity? or, on the other hand, may the phenomena of the earlier stages of scarlatina be rationally accounted for by local morbid processes acting on the constitution through the agency of the nervous system, and probably also of the blood considered simply or mainly as "common carrier" and distributor of a locally produced *materies morbi*?

The first symptom of an attack of scarlatina that ordinarily attracts attention, and the earliest that finds place in most clinical histories of the disease, is fever, with vomiting, etc. I have, however, been led to entertain the belief that there is an earlier symptom, and that mainly by the following observations: First, out of a large number seen in the stage of invasion, some of them very early, I do not remember one in which throat-inflammation was not present. This has, indeed, in some cases been slight, but it has always

been unmistakable. Second, in a considerable number examined at varying short periods before the invasion of the fever, either in families in which there were previous cases or otherwise, I have in not a few seen a mild but characteristic faucial affection already present.

The result of these concurring observations on so many cases seen in different epidemics in dispensary service since 1869, and elsewhere, has been the belief that the precedence of angina to every other symptom of scarlatina is probably not occasional or frequent, but invariable; that, in short, some degree of throat-inflammation is the one symptom that is never absent in scarlatina, and that it is always the initial symptom.

The observations of Dr. Bullard on these points have accorded with my own.

The length of time by which this symptom precedes the manifest outbreak of the fever is, like most things connected with scarlatina, very variable. I have in some cases seen the characteristic abnormal redness in the fauces for forty-eight hours before the invasion. In others it can have been there at most only two or three.

It must, however, be remembered that even an occasional absence of well-marked throat-inflammation at the time of first invasion does not invalidate the rule which has just been stated, for the primary local irritation that precedes inflammation may doubtless in some organizations occasion febrile disturbance before redness and swelling have had time to be fully developed.

Another suggestive fact, closely related to the preceding, has not escaped the notice of various observers, but has perhaps failed to receive the attention which its importance demands. It is that this throat-affection, which will presently be described, is not confined to those about to come down with the disease, but is often seen in those who are exposed to its contagion, but are protected by having had it, and those who, not being so protected, yet fail to take it.

I have made systematic observations with regard to the frequency of this phenomenon in about thirty consecutive families. This number may be too small to warrant a sweeping assertion. In those families, however, the occurrence of the faucial affection in both adults and children who were habitually in the room with the patients was the rule, and its absence the exception. In one instance, where the case terminated fatally after a three-days' illness, only two out of half a dozen persons present showed it. In two families, in each of which one very mild case occurred, there was a similar proportion of exemptions. But in every instance in which cases of some severity had been present for a week or more, the uniformity with which this appearance was observed was striking. Yet even here there were exceptions. In one family, for instance, in which two children were very ill with the disease, and the father and three other children presented a marked faucial redness, the mother, who was in constant attendance upon the patients, showed not the slightest trace of it.

The affection presented very various degrees of intensity, from a soreness that was voluntarily complained of to a slight and painless redness. The appetite and general health were usually very little, if at all affected. I took the temperature in several instances and found it normal. Dr. Bullard's observations upon this point are again in accordance with my own.

A physician who is a member of the Academy has informed me that he never attends a case of scarlatina without suffering from sore throat.

It appears from the foregoing observations that a very general effect of the scarlatinal contagion, when sufficiently intense and continuous in its action, is to excite throat-inflammation, and that this local inflammation is in a considerable percentage, even of the unprotected, its only effect; but in others is the herald, at least, if not the initial stage, of a malady which is by common consent a typical "essential fever."

It consists in a diffused redness, sometimes at first punctate, first seen in some cases on one or both of the faucial half-arches, then extending around them and involving the uvula, and extending also to the tonsils, which become reddened and more or less enlarged. The posterior wall of the pharynx is but little, if at all, affected. While this is the description of the typical and most usual form of this affection, as I have seen it, it must be added that some cases present little or nothing that is distinctive.

The fact that this throat-hyperæmia is so generally observed in those who are exposed to the scarlatinal contagion, and that it is observed on the very situations upon which the current of inspired air most directly impinges, cannot fail to suggest the query whether this contagion may not act primarily as an irritant to the sensitive mucous membrane of the fauces, and that what is commonly called the incubative stage of the disease may be a local rather than a general process.

In advancing, or, rather, reviving this suggestion, I am not unaware of the striking arguments by analogy which may be adduced *per contra* from the effect of various chemical poisons acting constitutionally upon certain selected localities. Nor do I forget the numerous and interesting throat-affections that occur in many other diseases, both general and local. The fact that some of these manifestations are secondary, like the faucial syphilides, does not exclude the possibility that others may be primary—as is most probably diphtheria. The question as to which of these classes the scarlatinal angina belongs, has, however, no material relation to the remarks and suggestions that are to follow.

DIPHTHERITIC COMPLICATION.

The frequent complication of diphtheria with scarlatina, which has seemed mysterious to many, admits, in accordance with the foregoing facts, of a simple and rational explanation. The primarily local disease, diphtheria, is actually invited, as is well known, when epidemic, by various forms of catarrhal throat-affection, any kind of sore throat being in this respect a source of danger. Now, it has been seen that the invasion of scarlatina is not only attended, but often preceded for hours, or even days, by a mild form of sore throat, and that a considerable proportion of persons in contact with the disease are similarly affected. Is it strange then, that we see scarlatina complicated by diphtheria at its earliest as well as at later stages, or that the two diseases not unfrequently attack simultaneously different persons in the same family?

THE STAGE OF INVASION.

It might be matter for curious inquiry what change takes place in the throat which has been the seat of redness for days, hours, or minutes before, when the fever actually begins. Might not this change be one from mere hyperæmia to actual inflammation, or from a mild and innocuous type or degree of inflammation to one that is severe and morbific? This is a region of hypothesis; for, as death never occurs from scarlatina

just at this point, pathology never has the opportunity to solve the problem, even if its present resources be equal to the task.

At all events, this change, whatever may be its nature, is usually quite sudden. The mild and prodromic angina has now given place to the disease scarlatina.

In essential corroboration of the statement that the first symptom of this stage is soreness of the throat, I quote from those excellent observers of this disease, Meigs and Pepper, the following: "Simultaneously with fever there is in nearly all cases more or less soreness of the throat. In all that we have examined, even those in which no pain was complained of, there has been redness, or redness with swelling of the fauces." In Reynolds' System of Medicine, sore throat is numbered first among the symptoms of the stage of invasion, with the remark that it is "the first symptom noticed by most adults."

It may be added that this angina, which ushers in scarlatina, continues throughout its course with an intensity which is, as a general rule, in direct proportion to the severity of the disease—though after the latter becomes complex it is only one of several important factors.

This symptom, then, is an interesting subject of study, and certain propositions concerning it may serve at least as bases for discussion.

The first of these is, that the scarlatinal angina is specific. It has a specific cause, specific appearances, a specific history, and possibly, at least, specific morbid products and constitutional effects.

Its appearance is characteristic. It may in typical cases be distinguished from ordinary catarrhal pharyngitis as well as from the sore throat that attends measles, small-pox, etc. Prof. Thomas, of Leipzig, in his excellent article on scarlatina in Ziemmsen's Cyclopædia, says, after a description of its various forms: "From these remarks it appears that the pharyngitis of scarlatina in the majority of cases and, at least, in those of moderate intensity, is not diffuse and general, but is confined to certain sections of the throat." He then quotes some observations of Härlin upon the cadaver, confirming the specific character of the scarlatinous angina.

This angina has, in its severe forms, a persistent intensity and an occasional malignity to which simple catarrhal pharyngitis rarely furnishes any parallel. It has, moreover, a special tendency to extend by continuity of surface into the nasal passages and into the Eustachian tubes.

A second proposition, and one which is perhaps worthy of especial consideration, is that *this angina is attended with a particularly potent peripheral nerve-irritation.* This is rendered probable by what has already been stated, and by the fact that it is so frequently accompanied by phenomena such as may be, and often are, the results of such irritation.

If these propositions are true, it follows as a corollary that its morbid products may be specific.

If it be objected that these specific morbid products are undemonstrated and hypothetical, it must be remembered that they are in this instance to be balanced against another hypothesis—that of a primary blood-change—which is as yet equally in need of positive demonstration. The supposition of their existence is favored by the analogy of what is seen in diphtheria, where a specific as well as a septic poison is produced locally, and penetrates the system.

It follows also that the constitutional effects of the scarlatinal angina may be specific, both by its peculiar nerve-irritation and by the absorption into the circulation of those morbid products.

Vomiting is a frequent, but not an uniform symptom. Out of 102 cases it occurred within the first twenty-four hours in 80. It was absent in some very grave cases.

This vomiting has been said by some authorities to be "projectile." I have failed to perceive that it differs in this or in any other respect from vomiting suddenly produced in children by a variety of other causes, and in various other diseases.

This vomiting is due to several circumstances. The chief of these is probably the reflex influence of the throat-irritation, as when the fauces are tickled; second, the effect upon the stomach and its ingesta of the sudden accession of fever; and third, the general nerve-disturbance.

Grave nerve-symptoms may occur, as is well known, during the period of invasion, but they are not so frequent, nor, as a rule, so intense, as they are at a later stage, which will presently be considered.

May not these initial nerve-symptoms be due simply to the angina? Such symptoms are not unknown as the attendants of simple pharyngitis, but are certainly less frequent in that connection. It has, however, already been remarked that there is probably an element of nerve-irritation in this scarlatinal angina that is not present to the same degree in other forms of sore throat. The peculiar bright redness that is so generally observed in it, varying in some bad forms to a dark and purplish hue, its rapid accession and increase, and its intensity in many cases, favor that supposition. Nor is it a valid counter-argument that in many of these cases there is no great local painfulness. The same is often true of the irritation of dentition, or of intestinal worms, when they excite convulsions and kindred reflex phenomena. Nor is it necessarily a valid counter-argument that, in some cases in which early nerve-symptoms are most pronounced, the angina is not seen to be severe. It is a well-known fact that some children are predisposed to suffer grave nerve-disturbances from causes that are apparently trivial, and which would produce no such effect upon the majority. In no connection are these idiosyncrasies of cerebro-spinal irritability more frequently and strikingly observed than in connection with the onset of scarlatina. And this is not merely true of individuals. It is no very unusual thing to see all the children of a family affected with severe forms of initial nerve-disturbance, even when the several attacks occur in different epidemics and at intervals of years.

But the nerve-disturbance at this stage of scarlatina is inseparably connected—probably both as cause and effect—with another important phenomenon, fever. This is usually sudden in its invasion, rapid in its rise, and often intense in character. May not this, too, be regarded simply as holding the same relation to the angina that symptomatic fever usually holds to local inflammations?

In fourteen recent cases the temperatures taken in this stage were as follows: 102¼°, 100°, 101¾°, 102°, 101¼°, 99½°, 101½°, 102°, 103⅝°, 101½°, 102¼°, 104°, 104¾°, 105°—the last having been taken on the third day in a malignant case, with intense angina and retarded eruption.

In two recently observed cases of ordinary follicular tonsillitis in children, the temperatures were 104¼° and 104 7/10°, the former accompanying violent and repeated convulsions.

WÜRZBURG.—The chair of surgery of the University of Würzburg, formerly held by the late Prof. von Linhart, will be filled by Prof. Bergmann.

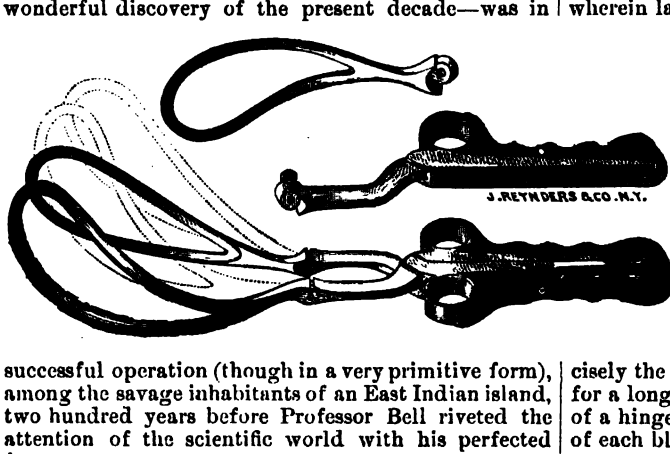
AN IMPROVEMENT IN THE OBSTETRICAL FORCEPS.

By MAUS R. VEDDER, M.D.,

NEW YORK.

In presenting to the notice of the profession my improved obstetrical forceps, it does not seem necessary that I should attempt to review the whole field of obstetrics, nor do I think it at all requisite to discuss, however briefly, the growth and development of the *armamentarium* of the obstetrician. I shall therefore confine myself to a few statements, which, I trust, will be sufficiently clear to enable my professional brethren to understand the improvement I have effected, as well as the course of reasoning in which it originated.

Of recent years the progress in medical science, particularly in the domain of surgery, has fully kept pace with the marvellous growth of science in general. As is well known, some of the really wonderful discoveries of modern times are but improvements on long existing forms, or the application of principles known from the remotest antiquity. Thales of Miletus described the phenomena and effects produced by the friction of amber, nearly twenty-five centuries before the same force was utilized by Morse in the electric telegraph. Even the telephone—the most wonderful discovery of the present decade—was in



successful operation (though in a very primitive form), among the savage inhabitants of an East Indian island, two hundred years before Professor Bell riveted the attention of the scientific world with his perfected instrument.

The common sewing-needle had been in use fully four thousand years before Howe conceived the idea of moving the eye towards the point; yet this simple change may be said to have revolutionized the art of sewing.

It has frequently occurred to me, during my practice, that the obstetrical forceps—even in its present perfection—was deficient in some principles, which, if discovered, would greatly increase its utility or convenience of employment.

Smellie, in his admirable "Treatise on Midwifery," aptly likens the forceps to a pair of artificial hands; and, indeed, so far as the mere grasping, or rather clasping of the child's head is concerned, the *simile* is a perfect one. It was Galen who said that man had hands given him because he was the wisest creature; but Anaxagoras had declared that the superiority of man was owing to his hand. With whichever we agree, it is indisputable that the superiority of the obstetrician is due in a large degree to the intelligent employment of the hands in practice.

As there are times, however, when the circumstances of the case limit the employment of the hands or call for other aids, recourse is had to the obstetrical forceps. These, as previously stated, are but artificial hands, and supplementary, as it were, to those of the obstetrician.

The forceps or pincers, it is well known, has been in use as a substitute for the finger and thumb from remote antiquity; and the obstetrical forceps as a substitute for the hands, since towards the close of the seventeenth century. While the former clasps or holds between the ends of the blades placed in apposition, the latter, acting in the same manner, clasps or holds between the inner surface of the blades themselves—the motion being purely prehensile, as in the case of the thumb and finger. Instead, then, of likening the obstetrical forceps to the hands, would it not be nearer the truth to compare it with a very large, broad, and strong finger and thumb.

The task of reducing a mechanical appliance to the absolute perfection of the human hand must be considered impossible, as the most perfect instrument can neither be endowed with the sense of touch, nor placed *en rapport* with the human brain.

Such being the case, the present obstetrical forceps may be considered as very nearly perfect. Still, while representing the human hand, the instrument has not the capabilities of that organ; and this fact early impressing itself upon my mind, I have devoted much thought to the subject, hoping to discover wherein lay the deficiency.

Chancing one day to place my wrists in juxtaposition, and curving the palms and fingers of the hands to resemble the fenestrated blades, I discovered that the forceps in common use resembled a pair of hands with limited motion at the wrists. The only motion, in fact, of which it was capable, was prehension, while the human hand possessed also the power of pronation, supination, and, when placed in the position I have just described, of a limited motion upward and downward.

Pronation and supination are seemingly of no avail in the forceps; but this other wrist-motion, I saw at a glance, was precisely the principle lacking, and the one which I had for a long time sought to discover. The introduction of a hinge or joint, with limited action in the shank of each blade of the forceps, was all that was necessary to effect this improvement; and the instrument thus constructed, by approximating more nearly to the human hand, could not fail to prove more serviceable in practice than those ordinarily employed.

Desirous of testing my theory on the subject, I laid my design before Messrs. John Reynders & Co. (New York city), who, in June, 1877, constructed to my order an obstetrical forceps of Simpson's pattern, which contained a hinge or joint of limited action in each shank, close to the fenestrated blade. This improved forceps I have tested on several occasions in actual practice, and have found it to possess in the utmost degree all the advantages I had hoped would follow its employment. My object, it should be understood, was not to overcome any particular, special, or single difficulty, but to supply to the existing forceps an element of usefulness which would be of avail in every case in which the instrument was employed.

Last September I showed my improved forceps to Dr. Fred. A. Castle, and, on the first of November following, to Professor Fordyce Barker. Both of these gentlemen expressed themselves as highly pleased with the improvement, and the latter commended it to Professor William T. Lusk, who presented it before

the Obstetrical Society on the sixth of November, 1877.

The great desideratum in the obstetrical forceps is an improvement which will enable the instrument to adapt itself to the curves of the pelvic straits. This, I claim, is perfectly accomplished by the improvement which I have effected—it being, in point of fact, the first which has advanced the obstetrical forceps beyond the grade of pincers or common forceps, capable of prehension alone. The improvement here presented also admits of a better adjustment of the blades; furthermore, it can be applied to forceps of any pattern, and cannot possibly interfere with traction.

It is in reality the bestowing of a wrist upon the rigid arm of the instrument. An ordinary hinge or joint over which the operator could exercise no control would be no more effective, as an adjunct to the forceps, than would be a nerveless wrist to the human hand. The peculiarity of the joint or hinge introduced in my improvement is that it is self-acting, and allows of the blades becoming movable, or fixed, at the will of the operator.

When traction is made, the self-adjusting mechanism of the joint fixes the handles in the position or at the angle in which they have been placed by the operator, thus preventing the fenestrated portion of the blades from moving either upward or downward. The instant traction ceases, the handles become free, and may be readjusted to suit the exigencies or requirements of the case, and without any more trouble than would attend a similar motion of the human wrist. The wood-cut here given does not, unfortunately, show the simple mechanism by which this fixation is effected; it is sufficiently explanatory, however, to enable any member of the profession to comprehend at a glance, both the nature of the improved forceps and the advantages which must result from its employment.

A decided objection to the employment of the forceps in common use, as applied to the head at or above the superior strait, is the impossibility of making traction in the line of that strait, the perineum opposing itself to the direction of the handles of the instrument. This difficulty is entirely obviated by the joint in the shank, which enables the operator to flex the handles, and thus guard against injurious pressure upon the perineum. Furthermore, the instrument is at all times perfectly free to obey the manual intelligence which guides it—a matter of no slight importance.

Thus the maximum of traction may be exerted when necessary, and without danger to the soft parts.

Should there appear to be a limit to the amount of traction possible (which I have not yet discovered), the independent traction-rods recently devised by M. Tarnier, and designed by him to enable the operator to make powerful traction, might be added to the improved instrument here presented.

To guard against the possibility of the mucous membrane being caught in the joints, the edges are bevelled; should further protection be desired, the joints may be surrounded by a piece of flexible rubber tubing.

The improved forceps here presented and described controverts no accepted theory, disputes no established fact, and interferes with no existing improvement. It is merely the addition of another element of usefulness to a useful instrument; and as it follows out the mechanism of one of Nature's most perfect constructions—the human hand, it cannot be assailed as a chimera, nor condemned as the idle fancy of an overwrought imagination.

Confident of its value, I unhesitatingly commit it to the profession, knowing from actual experience, that when tried, it will not disappoint the operator.

ASTHENOPIA FROM ABNORMAL INTEROCULAR DISTANCE.

BY M. J. DE ROSSETT, M.D.,

NEW YORK.

I HAVE recorded in private practice, during the past four years, six cases of asthenopia which could not be traced to errors of refraction, or to muscular insufficiency. In two of these cases the eyes were emmetropic, failing to discover H greater than $\frac{1}{8}$ after a vigorous use of atropia; in one case there was no Hm, but Hl $\frac{1}{30}$; in one, Hm $\frac{1}{36}$ and Ht $\frac{1}{30}$; in two, compound astigmatism, respectively H $\frac{1}{40}$ + Ah $\frac{1}{40}$ and H $\frac{1}{20}$ + Ah $\frac{1}{18}$. The following table exhibits at a glance the several conditions, and obviates the necessity of giving the cases in detail:

Case.	Age.	Occupation.	Refraction.	Interoc. Dist.
1	21	Clerk.	E.	77 mm.
2	27	Farmer.	E.	78 "
3	18	Student.	Hl $\frac{1}{40}$	76 "
4	34	Minister.	Ht $\frac{1}{30}$	79 "
5	29	Clerk.	H $\frac{1}{40}$ + Ah $\frac{1}{40}$	75 "
6	33	Tailor.	H $\frac{1}{20}$ + Ah $\frac{1}{18}$	76 "

There was no insufficiency of recti muscles, as determined by prisms at ten feet and at eight inches. In every case the face was broad and flat, and presented the characteristic expression imparted by eyes widely separated, as if there were a slight divergent strabismus; but there was no diplopia, and vision was binocular. In all there was marked marginal blepharitis of the lower lids, which were red and thickened, and strongly curved, having the maximum of curvature near the outer canthus, thus exposing much of the sclerotic at the outer and lower side of the cornea. The other symptoms of asthenopia were as usual: pain in the ball and brow, fatigue, blurring of letters after prolonged reading. The ophthalmoscopic measurements corresponded closely with the results from the test-types, and the fundus was normal in appearance in every case.

Cases I. and II. were entirely and permanently relieved by prisms of three degrees for each eye, bases inwards, used for reading and other near work.

Case III. first received for near work + $\frac{1}{36}$, but without benefit; then + $\frac{1}{30}$ decentred inwards, with temporary relief of some of the symptoms; afterwards + $\frac{1}{40}$ and a prism of two degrees, base inwards, which combination has sufficed to maintain perfect comfort for more than two years.

Case IV., after careful trial with + $\frac{1}{36}$, and the same decentred inwards, without success, was permanen relieved by $\frac{1}{36}$ and a prism of three degrees.

Cases V. and VI., instances of compound astigmasism. Tried several combinations; those indicated in the table suiting best, but not perfectly. Prisms were not ordered for these, for the reasons which the complexity of such combinations render obvious.

It is manifest at the outset that a pair of eyes having an interocular interval greater by from nine to thirteen millimetres than is normal must have two conditions entailed upon them, viz., a greater arc to be passed

over in sweeping to a given convergence, and a greater angle at all points of intersection of the visual lines. Therefore, even should there be no ametropia, the enforced disturbance in the correlated actions of the recti and ciliary systems offers conditions sufficient for the production of symptoms of asthenopia And it only becomes a question of the amount of independent action which may be cultivated between these two systems, since upon that will depend the severity of the asthenopia, which, in any event, would be small, unless the eyes are much used at near distances.

An interocular interval of seventy-six millimetres involves, for convergence at fourteen inches, an angle of convergence of about fourteen degrees as compared with ten degrees for eyes sixty-six millimetres apart, and *ipso facto* in its rotation the apex of the cornea must describe a larger arc. But the stronger central impulse necessary for this greater movement is synchronously imparted to the ciliary muscle, producing an excess of accommodation, so that with convergence at fourteen inches there would be accommodation for a nearer point. The desire for clear vision rebels against this, and although the relative accommodation may be considerable it will not prove equal to long-sustained effort without entailing fatigue. Changing the convergence to say ten inches, the object being at fourteen inches, would produce diplopia, besides a further effect upon the ciliary muscle; and relaxing accommodation to fourteen inches can only take place with removal of convergence to a yet more distant point; so that there arises a struggle to render these functions mutually independent, which for a time may succeed, finally, however, to end in asthenopia.

The indication which was followed in the treatment of Cases I., II., III., and IV. was to alter the convergence by means of prisms with a minimum effect upon accommodation. From Donder's brief and positive statement upon this point it might be inferred that this were possible to any extent, but experience does not warrant such a view, since strong prisms always affect accommodation as well as convergence, though in a less degree. Nevertheless there was a margin sufficient for the exigencies of these cases.

In Case I., which serves as a type for the others, the impulse for convergence at fourteen inches produced accommodation for ten inches approximately. The reading distance being maintained at fourteen inches, prisms of three degrees, base inwards, for each eye, made the page appear as if held at about nineteen inches, while the accommodation was adjusted for the true distance. Thus the physiological correlation of the two sets of muscles was re-established, and relief obtained from all asthenopic symptoms.

The treatment of all the cases was based upon like considerations, and it is to be observed that the combinations ordered for the hypermetrophies were as nearly orthoscopic as practicable, and afforded complete relief, which had not been obtained from the positive glasses alone.

It seems to me that such combinations of lens and prisms would prove likewise useful for cases in which it could be demonstrated that the visual angle was small, say less than two degrees. As to the possibility of asthenopia having its source in abnormal interocular distance, I think these cases and the results obtained leave no room for doubt.

I would remark in closing that it is to be inferred *a priori* that individuals who possess the peculiar developments of the facial and cranial bones which these presented would also have some abnormality in shape or size of the globe of the eye; and if the experience covered a much larger number of such variations than have fallen to my lot, doubtless the great majority would exhibit hypermetropic or astigmatic errors.

15 West 26th Street.

A CASE OF FACIAL PARALYSIS.

THE LESION MOST PROBABLY IN THE AQUEDUCTUS FALLOPII, BETWEEN THE ORIGIN OF THE PETROSAL AND CHORDA TYMPANI NERVES.

By W. H. COMEGYS, M.D.,

LATE INTERNE CINCINNATI HOSPITAL, CINCINNATI, OHIO.

F. L., æt. 16, cornice-maker and joiner, of average size and general good health, while engaged at work fell from the cornice of a house to the ground, a distance of thirty feet, striking first the right side of his head and shoulder. He remained unconscious for fifteen minutes. I saw him about four hours after the accident, and found a large swelling over the right parietal bone, and extending forwards to the orbit. I could detect no fracture, and he did not complain of any pain in the head. His right shoulder and forearm were painful, but no fracture existed. Otherwise the motor and sensory nerves were normal. Pupils normal; pulse 76; temp. $98\frac{4}{10}°$. I continued to visit him from day to day for seven days, and no untoward symptom revealed itself. My treatment consisted of cold applications to the head, and saline purgatives. The swelling subsided, and he had so far recovered from the shock of the injury that he began to go about the city.

September 14th, nine days after the injury, I was called to see him, and found him paralyzed on the right side. He stated that on the 12th he had walked about one mile, and came home feeling very much fatigued. On the following morning, on rising from his bed and attempting to walk into the next room, he was seized with a numbness in the right hand, which rapidly extended to his shoulder and downwards through the right leg to the toes; he would have fallen, but was caught.

When I arrived I found him suffering to some extent with pain in the right side of his head; the face was drawn to the left; he could not close the right eye, neither could he elevate the right eyebrow, nor frown on that side, nor whistle, and the food collected between the jaws and cheek on the same side. The pupils were normal, and the movements of the eye were under self-control. A paresis existed of the right arm and leg, and sensibility was somewhat diminished. He could walk, but inclined to the right side. No alteration of vision or smell, but his taste was lessened on the right side, and the tongue turned to the right. The palatine muscles were intact. No electro-muscular contractility of the right facial muscles.

Thus my patient now presented a state of complete facial paralysis, and a degree of right hemiplegia. The fact that he could not shut the right eye, and that there was no electro-muscular contractility in any muscle of expression of the right face, was conclusive evidence of an eccentric or peripheral affection of the right portia dura. In attempting to localize it I found that while the palatine and uvula muscles were intact, there was a marked diminution of his taste on the right side. It is known that the portia dura while in the Fallopian duct gives off, first, the petrosal nerves which animate the palatine muscles, and, second, the chorda tympani, which ministers to taste. I inferred, therefore, that the lesion of the portia dura was between the giving off of the petrosal and chorda tympani nerves. The taste on the right side of the mouth

has improved, but the facial paralysis has remained with but little change. He has also been given large doses of the iodide of potassium daily.

CINCINNATI, O.

A NEW GLYCOSURIC REAGENT.

BY HENRY G. PIFFARD, M.D.

EVERY one knows the uncertainty of Trommer's test and the bother of Fehling's solution. The following will be found a convenient substitute:

Take of

Sulphate of copper (ch. pure)..	1 part.
Crystallized tartrate of soda and potassa.....	5 parts.
Sodic hydrate (ch. pure).....	2 "

Mix thoroughly in a mortar; the more labor spent on this, the better the product. The result will be a pasty mass, which can be transferred to a wide-mouthed bottle, and kept till wanted. To use it, take of the mass a piece about the size of a co. cath. pill, put it in a test-tube, and add about two fluid drachms of water; boil till the mass is dissolved, and the solution has a uniform pale and rather dirty blue color; then add two or three drops of the suspected urine and boil again for a moment. If sugar be present, the usual reaction will be manifest. Mr. F. A. Reichardt has succeeded in making the mass into pills of proper size, one pill being sufficient for a test. A vial of these will be handy in the office, and less troublesome to manage than the usual tests. Trommer's test, unless performed with more than usual care, I do not consider reliable; Fehling's solution is reliable, but troublesome. The appreciation of these facts led me to the formula here given, which some one will probably still further improve.

10 WEST 35TH STREET.

Progress of Medical Science.

LYMPHADENOMA MALIGNUM.—The following case is reported by Dr. Englisch from the *Rudolph-Stiftung* in Vienna. Johann Koracs, shoemaker, aged 19, noticed an enlargement of a few glands in the left side of the neck, in December, 1875. The enlargement rapidly increased, and soon involved all the glands in that side of the neck, and some of those in the right side. He had previously always been in good health, and had never suffered from glandular swellings. He ascribed the affection to a damp dwelling-place. When he was admitted to the hospital in April, 1876, there was a hard, fixed mass filling the left side of the neck from the jaw to the clavicle. On the right side there were a few hard glands as large as a nut. The internal organs were normal; the morning temperature was normal as a rule, the evening slightly increased. The patient was put on the internal use of Fowler's solution, but it had no effect. The glands in the right axilla, and then those in the left, after a time became affected, and the spleen increased in size. The white blood-corpuscles were not increased. In August a pleurisy of the left side set in, and two small abscesses formed in the neck. Death in collapse on September 5th. At the *autopsy*, all the cervical and submaxillary glands, and also the axillary, bronchial, and right inguinal glands were found to be enlarged. The left pleural sac was about half filled with sero-fibrinous exudation. The spleen was double its usual size, pulp soft. The liver contained several small nodules composed of masses of lymph corpuscles and lymphoid cells; kidneys fatty.

Another case, which was observed in the Birmingham General Hospital, is reported by Dr. Russell. The patient, a woman 40 years of age, noticed a glandular enlargement in the right armpit in October, 1876. The enlargement extended slowly to the glands in the neck, arms, the other axilla, the front of the chest, and the groins, and was attended by pain. The spleen also became enlarged and was painful. The extension of the disease was attended by emaciation. In March, when she entered the hospital, she was anæmic and slightly emaciated. The blood showed diminution of the red, but no increase of the white corpuscles. The patient died somewhat suddenly of asthenia, on May 16th. After she entered the hospital there was some increase in the number of enlarged glands, and those beneath the left angle of the jaw suppurated. A week before death, a general and decided diminution in the size of the enlarged glands took place. Dr. Greenfield records a similar occurrence in one of his cases, taking place also towards the close of life. The temperature varied between 98° and 105°. There was a troublesome, almost incessant cough, and nearly half a pint of semi-transparent non-albuminous mucus was expectorated daily, but there were no physical signs. The cough and expectoration subsided after excision of the uvula, which was somewhat long.

Autopsy.—The glands in the neck, chest, abdomen, axillæ, arms, and front of thorax were enlarged, varying in size from that of a pea to that of a large walnut. On section, they presented the ordinary appearances of gland-tissue, without any creamy juice. The spleen was hypertrophied, and presented several irregular, dense, pale spots. Portions of the lungs seemed to be collapsed, and in some of these portions, and also in other places, there were irregular, sharply defined white spots. The microscopical examination of the enlarged glands showed the appearances of irritative hypertrophy; the stroma was broad and distinct, and contained in many places large, nucleated, and branching fibre-cells; the gland-cells had large, round nuclei and a delicate, highly refracting protoplasm. They measured as a rule about $\frac{1}{3\,\frac{1}{0\,0\,0}}$ of an inch. The white portions in the spleen showed in the periphery increase of the reticulum; in the centre the cells were indistinct and granular. In the condensed portions of the lungs the appearances resembled those of chronic phthisis.—*Bericht der k. k. Krankenanstalt Rudolph-Stiftung in Wien*, 1876, and *The British Medical Journal*, September 1st.

OVARIOTOMY AT THE SAMARITAN HOSPITAL. — In one of his last lectures in the Samaritan Hospital, before retiring from the active work of the institution, Mr. Spencer Wells gave a brief, but interesting review of the twenty years of his connection with the hospital. This includes the history of ovariotomy in England, from the first unsuccessful cases of Baker Brown, to the records of the Samaritan for the last two years, which show sixty-eight cases and sixty-one recoveries. During the first five years, about one case in three died at the Samaritan; during the second and third five years, about one in four; in the fourth five years, about one in five, but in the last two years only about one in ten died. The antiseptic system is now on trial, and Mr. Wells is more hopeful of favorable results since thymol has been introduced as a substitute for carbolic acid. Thymol has a pleasant odor, and has no poisonous properties, and, according to Dr.

Burdon Sanderson, is a hundred times more effective as a germicide than carbolic acid. Volkmann has had encouraging results even with so weak a solution as one part in two thousand of water. The surgery of the hospital, however, has not been confined to ovariotomy, and a long list of operations is mentioned, the latest and most interesting of which are nephrotomy and the draining of a renal cyst, under strict antiseptic precautions. Mr. Wells proposes to hold public consultations at the hospital one day in the week, on a similar plan to the one followed at St. Bartholomew's Hospital, not wishing to sever himself entirely from the scenes of his labors and successes.—*British Medical Journal*, Dec. 15, 1877.

Treatment of Pleuritic Effusion.—This has lately been the subject of much discussion, and the prominent names ranged on either side of the question show that the profession is by no means agreed on the proper method to be pursued. Dr. T. Clifford Allbutt divides the effusive pleurisies into:—1. Acute effusive. 2. Quiet effusive. 3. Empyemata. 4. Pleuritic dropsy. In the first class of cases the effusion has a tendency to become absorbed, and Dr. Allbutt deprecates operative interference. But if the effusion is so great as to cause great dyspnœa, or to interfere with the entrance of blood into the right heart, then tapping is indicated. Quiet effusive pleurisies are always dangerous; if the pleura is full, there is danger of sudden syncope, from the direct effect of pressure on the heart; if it is but partially full, there is danger of sudden increase, producing a similar effect. These effusions are difficult of absorption. Medicine has but little effect on them, the best treatment being repeated blistering stopping just short of vesication. If, however, the pleura be filled with fluid, the risk of injury to the lung, of empyema, and even of sudden death, is so great as to warrant the resort to tapping, which, in Dr. Allbutt's hands, has been followed by very favorable results. In empyema, operation of some sort is inevitable, and the doctor strongly recommends free drainage as the only method not followed by fever, adding that in private practice he had never lost a reasonably favorable case. Pleural dropsies seldom need puncture. Dr. George Johnson, in a clinical lecture presented a patient, to show the good effects of aspiration in copious effusion of long standing. The case was of traumatic origin, of seven weeks' duration, and the fluid consisted of serum, with a large admixture of blood. Seventy-seven ounces were withdrawn, giving immediate relief, and the patient was going rapidly on to complete recovery. After a careful analysis of three hundred and fifty-two cases, Dr. Goodhart, of Guy's Hospital, says: "I do not think there is any sufficient evidence in favor of the necessity or utility of paracentesis as a remedial agent in any large number of cases of simple pleuritic effusion," and he does not yet feel disposed to agree with Dr. Anstie in his doctrine that paracentesis "must become an every-day remedy for cases where an effusion, purulent *or not*, lingers for more than a very limited period." The results in empyema are not encouraging. Spontaneous recovery is possible. In twenty-six cases not operated upon, there were fifteen recoveries and eleven deaths; in fifty-one cases operated on, there were twenty-eight recoveries and twenty-three deaths. Dr. Wilson Fox has tabulated nearly 15,000 cases from hospital reports, and estimates the mean total mortality at from 10 to 17 per cent. "If we turn from these data," he continues, "to the mortality of pleurisy after paracentesis, no one can help being struck with the high mortality which has attended the cases operated upon, reaching, as a mean of recent observations, to 27 per cent., and only falling to or below 10 per cent. in the hands of observers the large proportion of whose operations have been confined to serous effusions in the early stage; while in others it has ranged as high as 45 to 52 per cent." He adds, however, that this high mortality is due in many instances to the nature and to the severity of the cases and of their complications. Dr. Lee recommends the maintenance of a vacuum in the pleural cavity after paracentesis; this he accomplishes by means of a cup placed over the opening; from this the air is exhausted by means of a modified Davidson's syringe.—*British Medical Journal*, Nov. 24, Dec. 8 and 15; *Lancet*, Dec. 8. Dr. Baum, of Dantzig, reports two cases of empyema in which he operated early by incision. Perfect recovery followed in both cases. The operations were performed antiseptically, and, at first, the cavities were washed out with a solution of salicylic acid, but this practice was early discontinued, because it was invariably followed by rise of temperature. He advises, in such cases, early operation and use of drainage-tube. The latter he secures in a peculiar manner. It is stitched to the skin in such a manner as to project about an inch; wads of carbolized cotton are then packed between the tube and threads; these wads are renewed at every dressing. He approves of exsection of a portion of a rib in cases where the lung has lost its electricity.—*Berliner klinische Wochenschrift*, No. 48.

Ano-pelvic Version—a Method applicable to Difficult Cases.—This is the name given by M. Guéniot to a method of version which, though not original with him, has not hitherto been described in detail. He has employed it for a number of years, and believes it to be applicable to difficult cases, such as shoulder-presentation, with tetanic contraction of the uterus, where evisceration of the fœtus is decided to be impracticable or inefficacious. It consists essentially in employing the weight of the body to assist the hand in penetrating to the fundus of the uterus, and in making traction on the pubic arch or the sacrum of the fœtus by means of the finger introduced into its rectum, and curved in the form of the crotchet. The hand being introduced into the vagina, the accoucheur presses his body forwards until it rests against the operating elbow, and then brings his weight to bear with more or less force on the point of the olecranon and the posterior surface of the arm. The forearm being thus pushed forwards, carries the hand, as it were mechanically, into the uterus, and forces it along towards the breech almost without fatigue or exertion. When the breech is found, the forefinger should be introduced into the rectum and traction made on the pubis or the sacrum, so as to draw the pelvis of the child into the excavation. It is usually much less difficult to find the breech than to seize a foot or a knee. The method also possesses other advantages: the pubis or the sacrum of the child affords a firm hold to the finger, and, the traction being direct, the force employed is completely utilized. The method may also be resorted to after podalic version has been tried and failed.—*Gazette Méd. de Paris*, Oct. 6, 1877.

Cystic Adenoma of the Lower Jaw Developed from Embryonic Mucous Glands.—Dr. Kolaczek reports the case of a peasant woman, aged 28 years, who had suffered for eight years from a gradually developing tumor in the left half of the lower jaw. It was removed along with the affected half of the jaw. The

tumor measured six and a quarter inches in length, four and three-quarters in width, and fifteen in circumference over the thickest part. It was separated from the surrounding tissues by a capsule. The tumor itself was firm and elastic, and contained cysts of different sizes. Imbedded in the stroma were numerous fragments of bone, some of which were nearly half an inch in thickness. The cysts, the largest of which was about the size of a walnut, contained thick, grayish-yellow mucus. The microscopical examination showed that the tumor was an adenoma with cystic degeneration. Its structure was exquisitely acinose, the acini being lined with a single layer of cylindrical cells. Dr. Kolaczek is of the opinion that this tumor sprang not from pre-existing normal glands, but from a glandular tissue that was developed during fœtal life, and failed to undergo the usual physiological destruction. He regards the tumor consequently as a congenital growth which remained latent for a certain time. —*Centralblatt für Chirurgie*, No. 38, 1877.

Pathology of the Granular Kidney.—In the September and October numbers of Virchow's *Archiv*, Dr. Richard Thoma, of Heidelberg, has communicated a series of observations upon the changes in the circulatory apparatus of granular or contracted kidneys, which are very welcome in the present state of the question. His first experiments were made to ascertain the relative permeability, under constant pressure, of the renal vessels in this disease, as estimated from the outflow from the renal vein, comparing this with the same as observed in healthy organs, the comparison being made under equal conditions of age. The result is to show that not only is the actual quantity which can be passed through the organ in a given time very largely reduced, as the smaller size of the organ might make us expect, but the proportion of the amount passing out by the renal vein, to that introduced by the renal artery, is much less than in healthy organs. He asks, is this due to the compression on the vessels by the new growth, or is it to be explained by the greater outflow through the walls of the vessels into the tubules? His next observations were to make very careful estimations of the weight of the kidneys at each period of life, and to measure with great accuracy the sectional area of the renal artery. He also calculated the volume of fluid which can pass through the kidney in a given time at different ages from three to twenty-seven years, showing that it increases with the growth of the organ. The sectional area of the renal artery in granular kidney is very slightly smaller than in healthy subjects of the same age, but relatively to the weight of the organ, it is from a fifth larger to twice as large. The intertubular arteries, the vasa afferentia, and the glomeruli are all absolutely larger. By another series of experiments, he found that the rapidity of the flow of fluid in the renal artery of granular kidney was not half, often not a fourth, of what it is in the renal artery of a healthy kidney. He also shows by a very large number of observations, that the transverse section of the renal artery grows wider as the organ undergoes development, and proportionately to the weight of the kidney; and, further, that the peripheral resistance to the entering fluid grows relatively less, so that a greater quantity of blood passes in a given time through the organ.

By a careful comparison of the effects of colored injections on sound and on granular kidneys, he found that the latter permitted the fluid to pass through the walls of the blood-vessels with much greater ease; and not fluid only, but gelatine, prussian blue, chloride of sodium, and even solid grains of cinnabar, and this without rupture of the coats of the vessels. This happened, not on those parts which showed most connective tissue growth, but in the vessels still otherwise apparently healthy. Careful injections proved, too, that the capillary net-work in granular kidneys was very scanty, and that in many cases the vasa afferentia anastomosed directly with the efferent vessels, being cut off from the glomerulus by the growth of fibrous tissue. On the changes in the walls of the vessels, he remarks that, as a rule, in spite of the fibroid growth of the intima, the lumina of the vessels are not smaller than normal; only exceptionally, when the endarteritis has reached a high grade, does this take place. He regards these changes as connected with the endarterial processes—described by Köster, Friedländer, Trompetter, and others—as taking place in almost all new formations of connective tissue, as they bear a distinct relation to the amount of interstitial growth. These facts are especially opposed to Gull and Sutton's theory that the narrowing of the lumina of the vessels by the new growth causes the obstruction to the circulation; they agree with independent observations that, as a rule, the vessels of granular kidneys are certainly not of less calibre than normal; they prove that the anatomical condition of the organ itself, independent of any vital changes, such as arterial contraction, causes a great increase in the resistance to the circulation through it: they explain the clinical phenomena of polyuria, and albuminuria by the increased permeability of the vascular walls.—*British Medical Journal*, December 24, 1877.

Abscess of the Heart.—Abscess of the heart is not a very rare termination of myocarditis, and pyæmic abscess has been noted by Schroetter, Klob, Stanley, Latham, Bennett, etc. The following case, however, reported by Drs. Creveling and Button, of Auburn, is somewhat unique: Thomas Brennan, aged 63, entered the State prison, June 6, 1877. On the 9th, 12th, 22d, and 29th of the same month, he complained of cardiac pains, which were sometimes relieved by anodynes, and sometimes passed off without treatment. July 15th he was again attacked, the pains grew rapidly more severe, and did not leave him until his death, Nov. 30th. At the autopsy the pericardium was found closely adherent over the entire surface of the heart; the endocardium was normal, showing no signs of inflammatory changes. A hard mass was discovered in the wall of the right ventricle, extending from about the middle of this cavity to near the top of the auricle, and encroaching somewhat upon both these cavities. On opening into the tumor, an ounce or more of good laudable pus escaped, the greater portion of which lay opposite the upper half of the right ventricle. The abscess had not pointed or given any other sign of spontaneous rupture. The external wall was about a quarter of an inch thick, the internal a trifle less. The whole amount of pus was situated in the muscular structure of the right side of the heart, which was still firm, giving no evidence of softening or degeneration; nor was there any endocarditis or valvular disease.

A Centenarian.—Anton Miktancic, the oldest inhabitant of Trieste, Austria, died on January 10th, at the ripe age of one hundred and thirteen years and nine months.

Dr. Fleischmann, of Vienna, a well-known authority on diseases of children, is dead.

COSTLY INSANE ASYLUMS.

UNDER ordinary circumstances the report of the superintendent of an insane asylum is not very interesting to the general practitioner, nor are such documents always intelligible in their statements or exact in their statistics. In some respects Dr. Kirkbride's report of the Pennsylvania Hospital for the Insane, for the year 1877, has a relevancy of its own to the important questions as to the best method of building and providing for the insane, which commends it to the careful attention of medical readers. The tables show the sex, age, and occupation of the 7,663 patients who have been admitted into the hospital since 1841, thus furnishing pretty reliable data as to the prevalence of insanity in the various departments of human activity. Of the whole number, 458 were farmers, 401 tradesmen, 444 clerks, 93 physicians, 98 lawyers, and 48 clergymen. The onset of the disease appears to be most probable between the ages of 20 and 30—1,360 of the whole number having been entered between the ages of 20 and 25; 1.326 between the ages of 25 and 30; and, consequently, 2,686 out of 7,663, or thirty-five per cent. of the whole admissions, between the ages of 20 and 30. Of this extraordinary percentage 1,430 were males and 1,256 females; showing a pretty even balance of the probabilities between the two sexes. A slight decrease in the probabilities appears to take effect between 30 and 35, and only 974 were admitted between those ages, against 895 between 35 and 40; 702 between 40 and 45; 295 between 45 and 50; 200 between 50 and 55; and 144 between 55 and 60. But although the percentage of admissions to an asylum is so great between 20 and 30, as compared with more advanced lustra, it must not be concluded that the probabilities, when measured by the whole number between those ages, are really so excessive as appears at first glance. Life is a process by which the unsound in body or mind are pretty carefully winnowed from the mass by diseases of various types during the first ten years of self-support and self-dependence. Taking any circle of society as an example, the number who are between 20 and 30 years of age will always be found largely in excess of the number between 30 and 40, and still more largely in excess of that between 40 and 50. It may be stated that, for the most part, in the struggle for existence, those who live beyond the age of 35 or 40 must be regarded as the soundest and fittest, both mentally and physically, for survival. The weak and unsound are usually driven to the wall, and die of privation and disease, or are reduced to insanity and pauperism, during the first ten or fifteen years of their self-dependence.

The percentage of cures urged by Dr. Kirkbride need not here be discussed, since he has raised more practical questions that directly concern the cost of asylums for the insane.

It may as well be premised here that, if the Association of Medical Superintendents of American Institutions for the Insane, for whom, in view of recent criticisms, Dr. Kirkbride evidently speaks, has no better justification to offer for the extravagant expenditures of the last ten or twelve years, then that Association has outlived its utility, and should be at once dissolved to make room for some organization and policy embodying a clearer perception of what the rights of the tax-payers are. As Dr. Kirkbride affirms, the propositions which have been unanimously adopted by that Association have been tested everywhere throughout the land by men of the highest ability, and with the most varied fields of observation. The question is not whether hospitals with a high class of accommodations have or have not advantages over those of less elaborate construction, nor whether counties can or cannot make good and reliable provision for their own lunatics; they can, if they will, of course; it is not likely that they will in the majority of instances. On the contrary, the question is whether a State can afford to provide shelter for its insane at $3,500 per capita, and food and medical attendance at from $7 to $8 a week, as the State of New York is now doing. It has been shown in these columns, by the testimony of experts of undoubted competence, that hospitals that furnish all the accommodations essential to the largest percentage of recoveries can be erected at a per capita cost of $1,000, and, by the reports of the Northampton (Mass.) asylum, that $3.50 a week is a sum amply sufficient to provide for maintenance. Now, while deprecation of any unwarranted attempt on the part of outsiders to undervalue the experience of experts is very natural and proper in the medical superintendent of an asylum, he is bound, nevertheless, to furnish a specific answer to specific allegations; and the specific allegation here is that extravagant expenditures have been the rule for the last twelve years, under the influence of the Association, and that such expenditures have never even called

out a resolution to the contrary. Under such circumstances the presumption is that the Association takes the responsibility not merely of fostering the erection of asylums at $3,500 per capita, but of Dr. John P. Gray's established figures of $7.96 per week for the maintenance of pauper insane. Possibly, indeed, the distinction between ordinary expenditures and current expenses adopted by Dr. Gray has received the sanction of the Association of Medical Superintendents. The truth is—and it may as well be owned first as last—there is no department of medicine in which so large an amount of vapid theorizing passes current for sound science as in this department, nor any department which it is the duty of the medical press more thoroughly and decidedly to overhaul. Read this passage, page 25, of Dr. Kirkbride's report, for example, in juxtaposition with the recent editorial in THE MEDICAL RECORD on "Asylum Building for the Insane in the United States":

"In addition to liberal appropriations for the improvement of the original State hospital buildings at Harrisburg, and for the extension of the work on those of Danville and Warren, the year has been specially distinguished by an act providing for a new hospital, for seven or eight hundred patients, in the south-eastern district of Pennsylvania."

In other words, although Pennsylvania has just expended some millions at Danville and Warren, she must expend two and a half millions more in the south-eastern district before her jails and poor-houses can be even theoretically emptied of the pauper insane now consigned to them; and it is quite unnecessary to remind Dr. Kirkbride that, were this new asylum, with a capacity for 800, to be completed and occupied to-morrow, a considerable percentage of the insane poor of the State would have to be left where they are, or another asylum of equal capacity would have to be erected for their accommodation. Nothing can be more unpleasant than the public duty that compels us to press these facts upon the attention of the profession. But the time has come for medical men at large to disavow a system that involves such extravagant expenditure of the public money to provide for insane paupers, and then provides for but a small proportion of them; and to express their disavowal in unmistakable terms.

SPONTANEOUS GENERATION — BASTIAN'S REPLY TO TYNDALL.

THE great problem of spontaneous generation again attracts the attention of scientists by the publication of fresh manifestoes by those who take the lead in advancing the rival theories. The side-issues involved in these investigations bear so strongly upon many of the most advanced views of eminent physicians, that the train of reasoning developed by this question should be followed by all who would study accurately the genesis and pathology of infective diseases.

Without referring to Redi, Needham, Spallanzani, Pasteur, and others, with whose works the student of the subject is doubtless familiar, it may be sufficient for the present purpose to state that Prof. Tyndall, as the result of recent and elaborate experiments, has drawn the inference that the cause of infection is in the air, and that the dust-particle is the cause of putrefactive life. He has also presented a number of instances which tend to disprove the argument of Bastian, that bacteria and their germs being destroyed at 140°, their presence after such exposure must be due to spontaneous generation.

In the last number of *The Nineteenth Century*, Dr. Bastian returns to the charge in support of his theory, and the following is an abstract of his reply to Prof. Tyndall: He states that he "commenced the examination of the subject in 1869, when a scrutiny of the evidence in favor of the germ theory and against spontaneous generation, as embodied in the writings of M. Pasteur, did not by any means convince him of the irreproachable nature of this evidence, and notwithstanding all the skill and care with which the experiments had been conducted." He says, "It was not indeed the experiments themselves, so far as they went, with which I was dissatisfied, but rather that I could not assent to the validity of the inferences which Pasteur had drawn from them."

Dr. Bastian further claims that the cardinal deductions and inferences of M. Pasteur, which he challenged in 1870 and 1871, have now (as he recently showed in Vol. XIV. of the Zoological Section of the Journal of the Linnean Society) been finally overturned. Whether or not M. Pasteur's germ theory may ultimately be established on other grounds, it is now perfectly obvious that it was not tenable on the ground alleged in 1870.

After defending himself from charges of vagueness, and deprecating the personal attacks made upon him from all directions, Dr. Bastian thus sums up his opinion of the recent elaborate experiments of Prof. Tyndall: "All this discussion about the nature of the atmospheric dust, visible and invisible, together with elaborate and ingenious experiments to prove its infective nature, so far as fermentations are concerned, has not really advanced the main question one iota."

"It is, as we have seen, impossible for Prof. Tyndall, by all the refinements which he has introduced into the study of this part of the subject, to get beyond the simple conclusion of Schwann, long anterior to the labors of Pasteur, that the air contains a "*something*" which is infective, but we are no more able to say now than Schwann was in 1837, what is the precise nature of this something."

In this view, he states, "I am supported by high authority."

"My more simple experiments, with glass vessels, from which most of the air had been expelled by

boiling, and in which heat was relied upon as the scourge of all antecedent life, had, moreover, thoroughly shown that the essential question does not lie in the direction of Prof. Tyndall's experiments."

The verdict in connection with spontaneous generation essentially depends on the answer which can be given to another problem. As the late Prof. Jeffries Wyman said: "The issue between the advocates and the opponents of the doctrine in question clearly turns on the extent to which it can be proved that living things resist the action of water at a high temperature."

In regard to the appearance of organisms in liquids previously boiled and guarded, Dr. Bastian says only two interpretations are possible.

There must have been a survival of organisms or germs, or else a new and independent birth of living particles. Yet, if we look at them merely in the light of previous experience, each of these interpretations seems alike at variance with our actual knowledge.

Should it be asked what warrant there is for supposing that living particles could come into independent birth from fluids, he replies, "that the general kinship between living and non-living matter is freely admitted by men of science at the present day," in support of which he quotes a passage from Huxley's "Evolution, and the Origin of Life." And further, he states our most profound thinkers and foremost men of science believe that such a process *did* take place in the early history of our planet. Among those who have expressed such a belief reference is made to Spencer, Lewis, Darwin, and Huxley; finally Virchow, whom he quotes as follows: "Nevertheless I admit that if we indeed want to form an idea how the first organic being could have originated by itself, nothing remains but to go back to spontaneous generation. This is clear. If I do not want to suppose a creation theory; if I do not want to believe that a special creation existed, who took the clod of clay, and blew his living breath into it; if I want to form some conception in my own way, *then* I must form it in the sense of '*generatio æquivoca.*'"

On the all-important question of the death-point of living matter, and the degree to which a power of resisting prolonged and higher temperature is conferred upon bacteria or their germs, by virtue of their previous desiccation, Dr. Bastian is quite unable to accept Prof. Tyndall's "assumptions." He says: "I go no further than to say that in the present state of the evidence bearing upon the subject, I regard the hypothesis of spontaneous generation as the most logical and consistent interpretation of the facts which are at present known. I am far from asserting that further experiment *may* not shift the balance of evidence in the opposite direction; but, in order that this may be brought about, something more than assumption must be forthcoming."

The foregoing is the substance of Dr. Bastian's reply contained in a long article in the last number of *The Nineteenth Century.*

Reports of Societies.

NEW YORK PATHOLOGICAL SOCIETY.

Stated Meeting, January 23, 1878.

DR. JOHN C. PETERS, PRESIDENT, IN THE CHAIR.

DR. BEVERLEY ROBINSON presented a patient upon whom he had performed tracheotomy for spasm of the glottis. The points of interest in the case were, first, the apparent absence of a cause for the spasm, and secondly, the admirable adaptation to the requirements of the case of Durham's tracheotomy-tube. The history was as follows:

A CASE OF SPASM OF THE GLOTTIS WITHOUT RECOGNIZED CAUSE. TRACHEOTOMY.

A. S., married, 54 years of age, basket-maker, came under my care Dec. 11, 1877. He has always been delicate, but has had no special diseases during many years. About 1857, patient had an attack of whooping-cough, from which he suffered severely. Seven years ago he commenced to have paroxysms of dyspnœa, which came on at intervals of six months. Two weeks before seeing me, the attacks of difficult breathing became much more frequent, but did not notably increase in severity. He had during this time two or three attacks each day, and on Dec. 10th had as many as eight. Formerly the attacks came on while at meals; latterly the dyspnœa has attacked him both day and night, and at irregular intervals. Five or six years ago he was troubled with lumbricoids. Since then he has not noticed any appearance of them. His nose, however, itches excessively, and has for years. No itching around anus. Pupils normal. Appetite generally good. Bowels regular. Occasionally patient has attacks of vertigo. He lost consciousness on several occasions some years ago, but not latterly. In these attacks he did not foam at the mouth, bite his tongue, or have convulsions. His vision is normal. There is no difficulty of deglutition. All the muscles of the face contract by an effort of will; no numbness or queer sensations in any part of the body; walks as well as ever; strength of grasp normal; memory always poor since boyhood; breathing good, except during paroxysms, until two weeks ago, when patient commenced to have a hacking cough and tickling in the throat. The cough, he believes, is the cause of greater frequency of his attacks of dyspnœa. Patient is a dyspeptic.

Physical examination reveals congestion of fauces and considerable elongation of uvula; epiglottis and arytenoid cartilages reddened; vocal cords dirty-white color. While examining patient's larynx, he was suddenly taken with an attack of very intense dyspnœa, and sank upon the floor. There were stridulous inspirations, and during expirations a sort of wailing cry. This attack lasted about five minutes, and patient was in greatest anxiety; it was relieved by striking him in the back with a book, and with all my strength. Inhalation of ether did not appear to help him (doubtless on account of approximation of the vocal cords during inspiration). The examination of the chest, after the termination of the attack, was almost negative; a few medium-sized bronchial râles only were disseminated in the left lung; heart normal.

℞. Potass. bromidi..... 3 j.
Tinct. belladonnæ..... ♏ x. at bedtime.

Dec. 13th.—Attacks not relieved; excision of uvula; an application of tincture of iron and glycerine to the larynx brought on a new attack of dyspnœa.

℞. Potass. bromidi, ʒj. every hour.

I saw patient after he had taken five doses; they had little or no effect.

℞. Chloral, 10 grs. every hour, from 11 P.M. till 6 A.M.

Dec. 14th.—Had no attack during the night; one attack this morning. Supposing patient might have worms, I ordered a purge with Hunyadi Jänos, to be followed by santonine, gr. iij.

Repet. chloral less frequently.

Dec. 15th.—No worms were discovered; two spasmodic attacks. Repet. chloral, 10 grs. t. in d. sumend. and grs. xx. at bedtime. ℞. Inhal. conii; bowels to be kept loose; light meals; none after 5 o'clock P.M.

Dec. 21st., 10 A.M.—Came to my office in a carriage; very weak, breathing with great difficulty, and considerably cyanosed; sent him to hospital, and ordered moderate inhalations of chloroform.

3 P.M.—Tracheotomy performed, with the assistance of Dr. A. H. Smith.

Dec. 22d.—Coughed tube out of trachea; reintroduced with great difficulty, on account of false passage made by efforts of others to replace it.

Dec. 23d.—Patient breathing quietly; eats fairly; moderate expectoration.

℞. Mist. expect. (ammonii chlorid., etc., potass. bromidi).

Dec. 31st.—Patient has not had for three days the stridulous breathing and spasm of the bronchial tubes which he had at times for several days after the operation; walking about the room.

Jan. 3, 1878.—Wound around canula healed; no pain from wearing tube; expectoration very slight.

Jan. 11th.—Patient left hospital, wearing a permanent tube.

Jan. 13th.—Had a very severe attack of dyspnœa while I was examining fauces; during attack air was passing freely through tube.

℞. Potass. iodidi (gr. v.) and sp. æth. comp. ♏ xxx. t. d. s.

Jan. 17th.—No more spasms. Repet. mist.

DR. FLINT remarked that the symptoms in the case were suggestive of thoracic aneurism.

DR. ROBINSON replied that a very careful examination failed to detect any signs of the disease.

DR. BRIDDON did not think that one tracheotomy-tube was any better than another, as it was important that each should fit the patient for which it was intended. The longest period which any patient of his had worn a tube was six months. The case was one of syphilitic necrosis of the thyroid cartilage. He had never had much difficulty in introducing the tube.

DR. ROBINSON asked whether an essential asthmatic condition could give rise to the dyspnœa in this case.

DR. FLINT thought that such cases were very rare. In the case in question he did not hear the earlier part of the history. His supposition was, however, in the direction of aneurism.

DR. ROBINSON remarked that the disease had continued for seven years.

DR. FLINT admitted that such an element of time was a strong one against his supposition.

PROF. WM. OSLER, of Montreal, then read, by invitation, an elaborate and interesting paper on Hog Cholera.

ULCER OF DUODENUM DIAGNOSTICATED BEFORE DEATH.

Dr. Osler then presented a specimen of ulcer of the duodenum removed from a patient of Montreal, who had been seen in consultation by Dr. Flint. The patient had suffered for ten years with attacks of pain in the stomach, accompanied by occasional vomiting. During this period he had four or five attacks of hematemesis. The man died of exhaustion and Dr. Osler made the autopsy. An ulcer was found in the duodenum three-quarters of an inch in length and half an inch in breadth, just outside the pylorus and involving the gastro-epiploica dextra. Dr. Osler remarked that the case was of interest in reference to the different opinions which were entertained regarding its nature, and especially in connection with the diagnosis of duodenal ulcer made by the physician in attendance and previous to the death of the patient.

DR. FLINT remarked that cases of that sort were very rare, and that the diagnostic points which distinguished them from ulcer of the stomach were not well established. The history as related by Dr. Osler was correct. The patient had suffered for ten years with pains referable to the region of the stomach. They occurred mostly in the spring and autumn, and as a rule continued about a month. At first they were slight, so that pressure and stimulants relieved them, but in the course of years they became very severe. In the intervals of these attacks his health was good. The symptom of vomiting was duly considered, as was also the hematemesis. Dr. Flint was inclined, however, to look upon the affection as of a neuralgic character, the length of time which the symptoms had existed ruling out the possibility of organic disease. Although the possibility of the existence of an ulcer was suggested to his mind, there were not enough symptoms to establish a diagnosis.

DR. PETERS asked if there were any evidences of healed ulcers in the stomach.

DR. OSLER replied in the negative. He stated that the diagnosis of duodenal ulcer was made by the attending physician from the fact that the patient had extreme stenosis of pulmonary orifice, a large bloody stool, and had no hematemesis at the time. This circumstance was sufficient to convince the gentleman in question that the source of the blood was outside of the stomach.

DR. PETERS believed that there were twelve cases of duodenal ulcer in the records of the Society.

EXTREME STENOSIS OF PULMONARY ORIFICE.

DR. OSLER presented a second specimen, which consisted of a heart removed from a child four months old. The patient had suffered since birth with symptoms of cyanosis; otherwise there were no evidences of any trouble either about the heart or the lungs. He had never seen the child during life, but was merely called in to make the autopsy. When the pericardium was opened, the first thing which presented itself was an enormous right auricle, nearly the size of a small orange, which was distended with blood. The tricuspid orifice was very much contracted, as the result of previous endocarditis. There was extreme stenosis of the orifice of the pulmonary artery, so that a Bowman's probe nine-tenths of a millimetre could scarcely enter. The artery beyond the orifice was of fair size, and there were no signs of degeneration in it. He was of the opinion that the affection originated in an intra-uterine endocarditis.

On motion of Dr. Dalton, the Society tendered a vote of thanks to Prof. Osler for his able and instructive paper; also for the interesting specimens exhibited by him.

The Society then went into Executive Session.

Stated Meeting February 13, 1878.

DR. J. C. PETERS, PRESIDENT. IN THE CHAIR.

INAUGURAL ADDRESS.

AFTER the reading of the minutes, the President, Dr. JOHN C. PETERS, made the following remarks:

Such a strange and moving topic was introduced at the last meeting by a stranger, and so many strange faces were seen here, and the whole proceedings had such an unhomelike aspect, that I did not feel justified in "throwing pearls before swine," and reserved the expression of those feelings of gratitude which I feel for the high honor you have paid me.

It is a very high honor to be presiding officer of this Society, for this chair has been filled successively by John A. Swett, Willard Parker, James R. Wood, T. M. Markoe, Wm. H. Van Buren, C. E. Isaacs, John T. Metcalfe, Robert Watts, Edmund R. Peaslee, John C. Dalton, Alfred C. Post, T. C. Finnell, Abraham Jacobi, Gurdon Buck, Henry B. Sands, Wm. B. Bibbins, Lewis A. Sayre, Joseph Hutchinson, Alfred L. Loomis, Erskine Mason, Herman Knapp, Francis Delafield, Charles K. Briddon, and last, but not least, Edward G. Janeway. The Society was founded in 1844 and '45, by Middleton Goldsmith. John C. Peters, Lewis A. Sayre, Gustavus A. Sabine, Wm. C. Roberts, Wm. H. Macnevin, James Crane, Robert Tomes, John A. Swett, Willard Parker, Robert Watts, Thomas M. Markoe, Alonzo Clark, John Forry, James R. Wood, Isaac E. Taylor, W. W. Jones, Wm. H. Van Buren, Thaddeus Halstead, C. E. Isaacs, John T. Metcalfe, Edward Hall, H. D. Bulkley, George Wilkes, C. R. Gilman, R. McCready, and others of like stamp. A society founded by men of such experience and ability had necessarily to prosper. Its workings have always been of the most practical kind, but science was largely represented in its very beginning, and steadily have been trained up within its ranks men who have no superiors at the bedside, in the lecture-room, and in the highest walks of science, and who have so far outstripped the busy and experienced general practitioner, with whom deaths are few and *post-mortems* something extraordinary, that something may well be done to entice these worthy men to our meetings.

It is already becoming a general complaint of those who were educated thirty years ago, that the proceedings of many of our societies are becoming too erudite and scientific for the average general practitioner, who, as some one has said, will neither die nor be born again, and hence must be aided in every possible way, or left to perish slowly by the way-side. A pathological society is not an assemblage especially of tender-hearted men; but I submit the question to it.

Of the 23 physicians who founded this Society 34 years ago, 13 are still alive and 9 are still active members, viz.: Drs. Alonzo Clark, Willard Parker, Thomas M. Markoe, Gustavus A. Sabine, Isaac E. Taylor, James R. Wood, Lewis A. Sayre, John T. Metcalfe, and John C. Peters.

GLIOMA OF THE CEREBELLUM.

DR. T. E. SATTERTHWAITE presented a specimen of the above with the following history:

G. B., 24, Germany, single, was admitted into the Presbyterian Hospital, Aug. 3, 1877.

His previous health had been good, and he denied having had venereal disease. In the preceding June he awoke one morning with a severe pain in the back of his neck, at about the junction of the last cervical with the first dorsal vertebræ. The pain soon disappeared, but was brought on again by leaning over to wash his face. Afterwards it would leave him, to return when he again bent his head over. On July 3d the pain left the neck and appeared in the back of the head. Soon after this the attacks of pain in his head became more frequent and without apparent cause. When he was admitted to the hospital, pain was located in the occipital and supraorbital regions, and was so severe that he would at times scream out. The attacks came on four or five times a day, and usually lasted about half an hour. The pain was much more severe when he was lying down. He had little rest at night. Appetite was good. He received a variety of medicines: croton-chloral-hydrate first, in 5 gr., and later in 25 gr. doses, but without benefit; ergot in ʒ i. doses, with counter-irritation to the back of the neck, was also resorted to; also bromide of potassium. At one time iodide of potassium was employed, and he took 100 grs. a day, so the fd. ext. of conium in 7 m. doses. Under this latter the pains lessened, but soon returned, and with them vomiting. This attack, however, passed away, and with it the pains; they, however, soon returned, and the same treatment was resorted to without success. About the 25th of September he was given morphia for the pains. The most effective remedy, however, was iced cloths to the head. He now said "he felt as if there was a chopping-machine in the back of his head," and he had a burning, cutting feeling in the supraorbital region, extending upward 2½ inches. At times he would feel perfectly well. On Oct. 1d he took phosphorus in minute doses, $\frac{1}{100}$ of a grain every four hours. On the 23d of October he went out on a pass, saying he felt perfectly well. On the following day, however, he commenced to vomit, and the pains returned as severely as ever. On the 26th he had suppression of urine. He was now taking morphia in large doses. On November 1st he had another attack of pain, and a seton was passed through the back of the neck. The pain diminished at the back, but increased in front. A seton was then introduced in the supraorbital region.

On November 12th, the patient was noticed to stagger a good deal in walking. On November 15th he could sleep but little. On November 19th he felt stronger and went out on a pass. He staggered but felt better. On November 20th, at 9 A.M., he was found in a cyanotic condition—breathless. Artificial respiration was kept up for an hour and a half, but without avail.

At the autopsy, twenty-four hours after death, the pupils were found evenly and semi-dilated. The heart and sac were normal, and the lungs were also, except that they showed slight adhesions at both apices. The stomach was abnormally small, but otherwise showed no points of interest. The spleen was congested and weighed 10½ ounces. Liver and kidneys were practically normal.

Brain.—On the posterior and upper portions of the cerebellum, between the henrispheres and on the middle line was found a tumor about two inches in diameter, encroaching on both hemispheres, but not distinctly separated from them. The tissue of the brain was found abnormally anæmic, œdematous, and softened. The sinuses, however, were free; the lateral ventricles were dilated, containing an excess of fluid; the foramen of Monro easily admitted a No. 10 English sound. As an interesting point in this connection, the pituitary body was dilated with fluid, and formed a little sac three-quarters of an inch in diameter, and the probe passed from the third ventricle, traversed the infundibulum, and entered the pituitary body.

The tumor was not observed at first, owing to the fact that its color and consistence were about that of the brain. When cut into, however, it was found to be unusually soft, and in consequence was difficult to preserve. He had the occipital neuralgia, the pain, the staggering, and the vomiting of tumor of the cerebellum, but he had no disturbances of speech, sight, or hearing. His pulse was about 90°, weak. His temperature was 96 or 97, but rarely 98° F.

The accumulation of serum in the ventricles, and their distension, might, I presume, be explained by the pressure of the growth upon the tentorium, and so upon the straight sinus, thus retarding the venous flow from the interior of the brain; but how account for the supra-orbital pain?

Dr. Gibney inquired whether the supra-orbital pain was due to the fact that the tumor involved any nerves arising in that region of the brain, or whether it might not be due to some disturbance of the function of the sympathetic ganglia?

Dr. Satterthwaite replied that the supra-orbital pain was one of the interesting features of the case.

On examination of the root of the fifth pair, no noticeable change was detected. The location of tumor also was not sufficiently near the pons to produce pressure upon the roots of the fifth pair. He thought, therefore, that pressure produced by the tumor must be eliminated, as a cause for the supra-orbital pain.

It was possible that the pressure produced by the enlarged and distended central cavities of the brain might have been a factor in the production of the pain, and it was also possible that the explanation suggested by Dr. Gibney was correct.

TAPE-WORM AND ANOMALOUS SYMPTOMS.

Dr. Robinson presented a tape-worm that had been discharged from a gentleman who consulted him for supposed organic disease of the heart, pain in the precordia, and attacks of vertigo. On examination there was found a systolic murmur confined to the apex. Keeping track of the case and somewhat doubtful of the diagnosis, the fact was elicited that some years before the patient had discharged a flattened worm. This circumstance was the more curious from the fact that there was nothing in the man's history that pointed to the existence of such a parasite. However, a drachm dose of the ethereal extract of male fern was given on an empty stomach, followed by a purge. This was sufficient to discharge a large portion of a tænia. The head could not be found, but Dr. R. thought it was not always necessary that such should be discharged to insure the disappearance of the worm. Sixteen months ago he had presented a tænia, minus the head, discharged from a female cook, and stated at the time the probability that there would be no return of the disease. That patient had been perfectly well since then, and had presented none of her former symptoms referable to the presence of the worm.

Dr. Van Geisen asked if the heart-symptoms ceased in the case presented, after the discharge of the tape-worm.

Dr. Robinson had not examined the patient's heart since that time, but all the subjective symptoms had disappeared.

Dr. Van Geisen believed that a murmur in that locality would indicate organic disease, and as such could not be affected by the special treatment employed.

Dr. Robinson did not think it was necessarily an organic murmur, but, on the contrary, believed it to be functional, producing reflex insufficiency of the tricuspid valves.

Dr. Carpenter asked if there was any venous pulsation in the neck indicating such insufficiency.

Dr. Robinson said that no such condition was noted. But there might be tricuspid insufficiency without it. The pulsation was not shown sometimes until serious embarrassment of the breathing occurred in consequence of lung complications.

The Society then went into Executive Session.

Stated Meeting, February 27, 1878.

Dr. John C. Peters, President, in the Chair.

CONGENITAL TALIPES CALCANEUS, WITH ARREST OF DEVELOPMENT.

Dr. Gibney presented a patient having congenital talipes calcaneus, with arrest of development.

The history was as follows:

On the 14th of January, 1878, there was presented at the out-door department of the Hospital for the Ruptured and Crippled, a female child æt. 2 years, presenting the following points of interest: The right leg was seemingly shorter than the left, curving anteriorly, and giving a marked fulness on its anterior aspect middle third; a small, dimple-like depression at the summit of this fulness, in which, the father asserts, the great toe lay imbedded at birth, the foot in *complete* dorso-flexion, making thus a case of talipes calcaneus extremis; a talipes equino-valgus now existing, the foot being one-half inch shorter than its fellow, and minus the second toe, as well as the corresponding metatarsal bone; a subluxation outward, amounting almost to a luxation at the tibio-tarsal joint, reducible on flexing the foot, and inverting without causing any pain. No special loss of power in the muscles, and no loss of faradic or galvanic reactions, although this examination was not perfectly satisfactory, on account of the crossness of the child; a marked genu-valgum, with a moderate degree of subluxation inward at the knee (a grating or slipping is distinctly felt here on flexion).

The labor was natural (head-presentation), and complete in one hour. No history of any fright during utero-gestation. Wife reported as delicate, while the father is a stout, healthy man.

The depression was never in a state of ulceration, so far as I can learn. I bring the case to afford a possible explanation for these dimples or depressions observed in cases of club-foot and other congenital deformities. The case recently presented by Dr. Putnam-Jacobi called forth some discussion on this subject, and no adequate explanation seemed to be offered.

In the one I now present, a clear history has been obtained, and hence the interest attached.

CARCINOMA UTERI.

Dr. Post presented a specimen of carcinoma of the uterus, bladder, and rectum.

Dr. Post also exhibited specimens of diseased lymphatic glands removed from a boy aged nine years. The patient had been operated upon for the same trouble two years ago, since which time the enlargements had recurred. The point of interest in the case was the situation of the glands, entirely behind the sterno-cleido-mastoid muscle, and which, in consequence of the proximity of important vessels, required extraordinary care in the operation.

DOES CANCER EVER COMMENCE IN THE VAGINA?

DR. VAN GEISEN asked, in regard to Dr. Post's case of carcinoma uteri, whether the disease ever commenced in the vagina. He had a case in point which seemed to prove such a possibility.

Dr. Post thought that such a state of things must be very rare.

DR. BRIDDON had met with one such case in which the cancerous growth was entirely confined to the posterior wall of the vagina. The case was seen in consultation by Dr. Van Beuren. Dr. Briddon removed the growth by simply peeling it from the subjacent tissue, showing that the disease was quite superficial. It returned, however, in the course of three years afterwards, and involved the bladder, rectum, and uterus.

DR. BEVERLEY ROBINSON presented a specimen of acute miliary tuberculosis.

SPASM OF THE GLOTTIS, DUE TO PRESSURE ON THE RIGHT RECURRENT LARYNGEAL NERVE, CAUSING DEATH FROM ASPHYXIA.

DR. W. T. BULL presented a specimen with the following history:

C. O'C., æt. 25, was brought to the Chambers Street Hospital, Feb. 16th, at 11.45 A.M. When first seen, he was walking with difficulty, supported by two men, coughing frequently, expectorating very offensive bloody mucus, and gasping for breath. There was considerable cyanosis of the face; the surface was cool, the pulse 100 and moderately full. The passage of air through the glottis or trachea was interfered with both in inspiration and expiration. The struggles of the patient prevented satisfactory auscultation, and percussion gave no marked dulness in any part of the chest. There was a trifling swelling of the neck externally, and pain on pressure over the larynx. The lower jaw was so firmly held that a screw-gag was necessary, in order to introduce the finger to the base of the tongue. No swelling could be felt there. The epiglottis could not be reached. The voice was clear on entering the wards, but soon became hoarse and inaudible.

The only information to be obtained from his friends was that for five days past he had had a cold, with pain in the back and chest, and during twenty-four hours previously to admission a cough with brownish expectoration.

It was resolved to use antispasmodics, and, if they proved insufficient, to perform tracheotomy, although the exact condition was very obscure. Fifteen minims of Magendie's solution of sulphate of morphia were given hypodermically, and ten minutes later chloroform inhalations. The struggles of the patient ceased, but the obstruction to the passage of air was unrelieved, and while instruments were being brought, respiration stopped entirely. Artificial respiration was resorted to, the tongue being drawn forward by a string passed through its tip. This was followed by gradual improvement. The air passed freely into the chest; respiration was regular, but shallow; the cyanosis disappeared; pupils were contracted. Tinct. belladonnæ, ℥v., were given hypodermically and repeated after fifteen minutes. Respiration became deeper, the surface of the body warm, the pulse 100 and of good volume. It was thought that the danger of asphyxia was past. Fifteen minutes elapsed without change in the condition, when there was a sudden interruption to inspiration. The breathing stopped at once, and the heart a minute later.

Autopsy twenty-four hours after death: Body of well-nourished muscular man, with thick layer of subcutaneous fat; heart normal; left ventricle empty and contracted, right containing a small soft clot; lungs exhibited marked congestion, with slight œdema, and on both sides old pleuritic adhesions; mucous membrane of the larynx, trachea, and bronchial tubes deeply congested, without exudation; in the groove between the trachea and œsophagus, on the right side of the neck and beneath the common carotid and subclavian arteries, an abscess apparently originating in the lymphatic glands; it formed a tumor three inches in length by one inch in diameter, extending upward as far as the middle of the right lobe of the thyroid, and downward to a point just below the bifurcation of the innominate artery. Its cavity contained healthy-looking, but offensive pus. No encroachment on the walls of the trachea or œsophagus, but thickening and infiltration of the tissues surrounding it, especially towards the trachea. The pneumogastric nerve and large vessels were normal; the recurrent laryngeal nerve, after winding round the subclavian artery, was imbedded in the dense tissue forming the tracheal wall of the abscess for a distance of two and a half inches. To the eye it presented nothing abnormal; other organs were healthy.

Dr. Bull said furthermore, that, while in view of the history and post-mortem appearances the case was clear enough, it had puzzled him very much. He regretted that tracheotomy was not performed at the outset. He had never heard of a similar case, and Dr. Peabody, who had made a careful dissection of the preparation, after a rapid search through pathological literature had been unable to find one. It seemed rational to consider it analogous to fatal cases of spasm of the glottis produced by the pressure of small aneurisms on one recurrent laryngeal nerve, which are recorded by standard authors.

POST-TRACHEAL ABSCESS AND THREATENED SUFFOCATION.

DR. BRIDDON related a case of a somewhat similar character, which at the time of its occurrence caused him no little anxiety. About sixteen years ago he was called to see a man in Dover street, who was reported to him as choking to death. When Dr. B. arrived he found the patient in extreme apnœa, with neck very much swollen, face purple, eyes gorged, pupils dilated, and altogether in a very alarming condition. In the act of depressing the tongue with a spoon a gush of pus apparently filled the windpipe, the man stopped breathing, and slid from his chair to the floor. The situation was critical, inasmuch as the means hardly justified the result. As no time was to be lost, and as the patient's brother, a policeman, who was present, was developing his interest in the case, Dr. Briddon plunged a knife in the windpipe. Coincident with this there was an escape of pus from the wound and a gasp from the patient, which was promptly and cheerfully responded to by the operator. In this instance Dr. B. supposed that an abscess, which had been somewhere in the same location as in Dr. Bull's case, had burst in the trachea. The patient made a tedious, although perfect, recovery.

DR. SAYRE asked Dr. Bull what was the probable origin of the abscess.

DR. BULL replied that in all probability the origin was a lymphatic gland in the neighborhood, as it was distinctly circumscribed and unconnected with any diseased bone.

DR. SAYRE stated that some time since he had been called to a prominent politician in Washington, who for

four or five days had been suffering from obstruction of breathing. Two or three incisions had been made in the neck with a view of giving exit to pus, but none was found. When Dr. S. arrived the man was suffering intensely, was cyanozed and breathing with extreme difficulty. The jaws were pried open and an abscess which pointed alongside the jaw was opened. The relief was marked and immediate. Dr. S. thought that in this case the abscess started in caries of the jaw, burrowed its way underneath the fascia, and pressed backward upon the trachea.

Dr. Peters stated that in retro-pharyngeal abscess a certain number of cases arose in connection with diseases of the lymphatic glands, but in such the glands are more abundant than normal.

(To be continued.)

Correspondence.

THE CURE OF HIP-DISEASE BY OPERATION.

To the Editor of The Medical Record.

Sir:—I observe in your issue of this date an article from Dr. V. P. Gibney on "The Ultimate Results in Excision of Hip-joint," which contains so many inaccuracies and misrepresentations that I feel bound, in the interest of science, to notice it.

All of the cases to which I referred had been under the charge of Drs. Knight or Gibney, at the Hospital for Ruptured and Crippled, for a longer or shorter period, and left the hospital because the disease was progressing, and they were considered incurable, according to the statements made by the parents or physicians who brought them to me.

I have no other authority for my statement that they were discharged from the hospital as incurable, than the testimony of the patients themselves and their friends.

That they were incurable without an operation at the time I saw them and advised it, is evident from the fact that such accomplished surgeons as Drs. Jas. R. Wood, Stephen Smith, J. W. S. Gouley, Alfred C. Post, and others, who saw the cases with me, approved of the operations, and assisted me in them, or were present when I performed them.

The case of Potter, he says, "was never treated as an in-patient of the hospital, *and I can find no record of his case.*" (The italics are mine.) He says, however, "Dr. Knight, the Resident Physician, has a distinct recollection of the case," and that he was under his treatment in the spring and summer of 1875, and he observed that the disease was progressing.

In Case VIII. of Chas. Smith, Dr. Gibney says he "was never in the hospital, and I have searched diligently for his name among the indexed out-door patients [*all* who were ever here are *indexed*] between the years 1872 and 1876 *inclusive.*" (The italics are mine.)

Yet in the case of Potter he says: "*I find no record of his case;*" and yet in the next sentence states that Dr. Knight has a distinct recollection of it as being under treatment in the "spring and summer of 1875," the very period in which he declares that *all cases* were indexed. If Potter was omitted, why not Smith? I leave for Dr. Gibney to explain this contradiction.

In regard to Potter's present condition, he says: "Dr. Sayre tells me that he is cured, but is suffering from malarial poisoning, is in the south of France, and, up to the last accounts, the mother was in search of certain baths reported as beneficial to patients with *hip-disease.*"

I am very much surprised that Dr. Gibney, who professed to be in search of facts "for the sake of science," should so misrepresent the truth. Instead of my telling him that Potter was cured, I allowed him to read a letter from his mother, dated France, Jan. 21, 1878, in which she states, among other things: "Dick proved an admirable sailor; *he was never ill a moment* (the italics are mine); was up on deck nearly every day. He rides out sometimes in an open carriage, and sometimes goes on a donkey, which he enjoys very much." And she concludes the letter by "Dick bids me give you his love, and tell you that he is very well."

I have just received this letter, and I do not find the word malaria in it, or that he was suffering from any "malarial poisoning;" and from the fact that he rides upon a donkey, I presume that his hip is in good condition, or his mother would certainly refer to it.

I send these hurried notes, that the profession may suspend their judgment until I have time to note the other inaccuracies contained in Dr. Gibney's paper.

Respectfully,

Lewis A. Sayre.

285 Fifth Av., March 16, 1878.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from March 10 *to March* 16, 1878.

Smart, Charles, Capt. and Asst. Surgeon. Assigned to temporary duty at Fort Preble, Me. S. O. 19, Div. of the Atlantic, March 11, 1878.

Carvallo, C., Capt. and Asst. Surgeon. Leave of absence extended two months. S. O. 51, A. G. O., March 9, 1878.

Porter, J. Y., 1st Lieut. and Asst. Surgeon. Granted leave of absence for 20 days, on condition that he furnish satisfactory medical attendance. S. O. 29, Dept. of the South, March 12, 1878.

Beall, G. T., Capt. and Medical Storekeeper. Granted leave of absence for two months on surgeon's certificate of disability. S. O. 51, C. S., A. G. O.

The following named asst. surgeons have been ordered to report in person to the President of the Army Medical Board for examination for promotion, and, upon completion of examination, to return to their proper stations:—S. S. Jessop, Peter Moffatt, Charles Styer, J. K. Corson, and Wm. R. Steinmetz.

Twins in France.—The relative frequency of twins in France has been made the subject of a statistical memoir to the Academy of Sciences, in which the statistics of the town of Nîmes from 1790 to 1875 are collated. During this period, 1262 deliveries of twins have been registered in a total number of about 130,000 births. Of the women thus distinguished, forty-eight had been twice delivered of twins; two, three times, and one, four times. M. Hermann, in his "Travaux Statistiques de la Russie," records, apropos of the foregoing, the case of a peasant at Moscow, one Fedor Vassilet, who had had, by two wives, 87 children. His first wife was confined 27 times, in 16 of which she bore twins; in 7, triplets; in 4, quadruplets. The second wife gave birth to 18 children in eight pregnancies. Vassilet was 75 years old in 1782, and 90 years later (1872) 83 of the 87 were still living.

Medical Items and News.

CONTAGIOUS DISEASES — WEEKLY STATEMENT.—Comparative statement of cases of Contagious Diseases reported to the Sanitary Bureau, Health Department, for the two weeks ending March 16, 1878.

Week Ending	Typhus Fever.	Typhoid Fever.	Scarlet Fever.	Cerebro-spinal Meningitis.	Measles.	Diphtheria.	Small-pox.

March 16, 1878...	0	5	94	0	98	81	0

MEDICAL WOMEN.—Thirty-five women have studied medicine in Paris since 1865. Of these, nine have received diplomas.

GERMAN UNIVERSITIES.—Germany has a university for every two millions of inhabitants.

DR. JOHN E. TYLER.—Dr. John E. Tyler died at his residence in Boston, March 9th, aged fifty-eight years.

NEW YORK STATE WOMAN'S HOSPITAL.—Dr. Nathan Bozeman has been elected surgeon to the New York State Woman's Hospital, to fill the vacancy caused by the death of Dr. Edmund R. Peaslee.

LARGE INFANTS.—Dr. Wm. C. Wile, of Sandy Hook, Conn., writes: "I desire, through the medium of the RECORD, to put on record the following singular cases of large children following one another in the same mother. Works on midwifery generally depreciate the accounts of large births, but the following can be amply substantiated, as I weighed them myself. Mrs. B., about twenty-three, very muscular, large-boned woman, was delivered of a living child by myself with the aid of the forceps, August 1, 1874, which weighed before dressed fifteen pounds and two ounces. She was delivered May 12, 1876, by the same means, of another child (living) which weighed fifteen pounds before being dressed. The two foregoing children were girls. May 13, 1877, she was delivered again in the same way of a living boy which weighed undressed fourteen pounds and fourteen ounces. Thus making three children, living when born, and perfect in point of development, which averaged *fifteen pounds a piece.* Both parents were Irish. I also delivered Mrs. L., last week, of a living child (boy) which weighed fifteen pounds and one half an ounce. I also delivered Mrs. H., April 14, 1874, assisted by Dr. Wm. Buntt, of Danbury, of a dead child (having exhausted every other means, we had to perform craniotomy) which weighed, without the brains, *twenty pounds.* This child was perfectly formed in every respect, and it was with the utmost difficulty that we could deliver the body after the head had been born.

"These seem to me remarkable cases, and the more so when we read in works on obstetrics of the extremes in weights. These cases occurred in about three hundred confinements."

SHALL PATIENTS WITH SPERMATORRHŒA MARRY?—Dr. Samuel W. Roberts, of Wakefield, N. H., in remarking upon the value of Dr. Howe's lectures on masturbation, writes:

"I would agree with the writer in everything except one: I believe it should be the exception, and not the rule, that such patients should marry, whether male or female. And why? Because such patients, as a rule, if they marry at all, do it from the advice of some physician, and not from any affection they may have for any female, for they very generally have none. Now it is very rare that a female marries for the sole object of sexual intercourse; and if, when married, she finds her husband had no other, or that this was the leading object, and that he has no real affection for her, and especially if she finds out—as she most surely will—that she has a husband who is not like other men, it will pretty surely make trouble in the family, and, so far as the diseased party is concerned, make a bad matter worse. If, however, the bargain can be made so that both parties can understand beforehand just how things stand—perhaps don't stand—or otherwise, and then both parties are willing to have married life take its natural course, then it would undoubtedly be—if the patient, by previous treatment, is in a condition to marry—the best thing that could be done. But if this is not the case, then married life is but a continuance of masturbation, and works the ruin not only of one but of a whole family. But I alluded to this subject more to see if something could not be done to have this matter brought before the community in some form by the medical profession, so that some good might be done to arrest the tide of evil which every medical man knows now exists from the not only private abuse of the reproductive organs, but from the abuse in sexual intercourse, not illicit wholly, but in married life. For we believe that this is at the bottom of more disease, and is more destructive to the human, more especially Yankee race, than all other causes combined."

PHILADELPHIA MEDICAL COMMENCEMENTS—JEFFERSON MEDICAL SCHOOL.—The Alumni Association of the Jefferson Medical College held its annual meeting on Monday, March 11th, in the college building. Dr. S. D. Gross was in the chair. The executive committee reported the deaths for the year as being those of Dr. J. M. Foltz, U. S. N.; Dr. Ralph M. Townsend, of Philadelphia; Prof. Nathan Smith, of Baltimore; Dr. R. V. Wilson, of Clearfield, N. J.; and Drs. J. Gordon Maxwell and H. L. Knight, of Philadelphia. Dr. Edward T. Casswell was elected orator for 1879. It was announced that fifty-three new members had been admitted during the year. At the election for officers Prof. S. D. Gross was re-elected president. In the evening the annual address before the alumni was delivered by Prof. D. S. Connor, of Cincinnati, his subject being "Medical Charities."

The fifty-third annual commencement of the college took place at noon of Tuesday, March 12, at the American Academy of Music. E. B. Gardette, M. D., President of the Board of Trustees, conferred the degree of Doctor of Medicine upon the 203 members of the graduating class.

Prof. John Biddle, Dean of the Faculty, awarded the following prizes: to Henry Morris, of Philadelphia, the H. C. Lea prize of $100, for the best thesis; to Daniel E. Hughes, of Penn., the prize of $50, for the best thesis on a physiological subject; the prize of $50 for the best surgical essay was divided between D. D. Smith, of Penn., and Wickliffe K. Curtis, of West Va.; the prize of $50 for the best essay on an obstetrical subject was given to Joseph R. Hamer, of Missouri; the prize of $50 for the best essay on a chemical subject, to Clement Biddle, the son of the Dean. A gold medal was awarded by the Demonstrator of Surgery to H. M. McClanahan, of Illinois. A gold medal by R. J. Levis, M.D., for the best report of his clinic at the Pennsylvania Hospital,

was given to Walter E. Hall, of N. J. The valedictory address to the graduating class was spoken by Ellerslie Wallace, M.D., Professor of Obstetrics and Diseases of Women and Children. The total number of matriculates the past session was 598.

UNIVERSITY OF PENNSYLVANIA MEDICAL SCHOOL.—The introductory address to the Spring Course of Lectures was delivered in the Medical Hall on Monday, March 11, by Joseph G. Richardson, M.D., Professor of Hygiene. His subject was "Medical Scepticism and Medical Superstitions."

At the meeting of the Board of Trustees of the University of Pennsylvania on Tuesday, March 12, Professors Charles J. Essig and Edwin T. Darby, of the Pennsylvania School of Dentistry, were elected to fill chairs of Operative Dentistry and Dental Histology, and of Mechanical Dentistry and Metallurgy. The professors in the new school of dentistry thus created in the University will be the two above mentioned, and those of Anatomy, Physiology, Chemistry, Materia Medica, and Morbid Anatomy, in the Medical School. Prof. Tyson, of the Medical School, has resigned his chair of Physiology in the Pennsylvania Dental College. The donors of the guarantee fund of $60,000, which was raised last fall to protect the Medical School against pecuniary loss during its first year under the new plan, and which has not been touched thus far (*about* $42,000 *have been received in fees from students during the past five months; enough not only to pay all salaries and all the running expenses of the school, but also to fit up all the laboratories, and leave a small surplus over and above all expenses*), have turned it over to the proper authorities, to be used for the construction and equipment of a new laboratory building and dental department. The trustees seem to incline favorably towards the inauguration of a school of Veterinary Medicine in connection with the Medical School. The annual supper to the graduating class was given in the Medical Hall on Wednesday evening, March 13.

On Thursday morning the Annual Address before the Alumni was delivered by W. B. Norcom, M.D., of Edenton, S. C., at the Hall of the College of Physicians and Surgeons.

On Thursday evening the Alumni Supper was served at the Medical Hall.

The Commencement Exercises of the 113th term of the Medical School began at noon on Friday, March 15th, at the Academy of Music. Prayer was offered by Rt. Rev. Bishop Stevens. Charles J. Stillé, Provost of the University, delivered diplomas to a graduating class of 127. Prof. D. Hayes Agnew, LL.D., made an address commemorative of the Endowment of the John Rhea Barton Chair of Surgery and Clinical Surgery. The Degree of Doctor of Laws was conferred upon Hon. John Welsh, our present Minister to England. The Valedictory Address was delivered by Dr. William Goodell, Professor of Clinical Gynæcology.

James W. Walk, of the class of 1878, presented a portrait of Emeritus Prof. Francis G. Smith to the Medical Department. The picture was received by Prof. Alfred Stillé.

The first prize of $100 for the best essay upon a medical subject was awarded to John Marshall, of Pa. The second prize of $100 was divided between J. A. Foulkrod, of Pa., and C. C. Seabrook, of Pa. The Gold Medal for the best Dissection was given to Onan B. Gross, of N. J. The second prize for Dissections, to Franklin B. Smith, of Md. The prize for the best record of anomalies, to J. R. Taylor, of Pa.

During the past year there have been 376 matriculates at the Medical School. The first-year men were 136 in number.

THE WOMAN'S MEDICAL COLLEGE Philadelphia graduated 19 female doctors on Thursday, March 14th.

Within the past two weeks there have been 616 graduates of the Philadelphia colleges of pharmacy, medicine, and dentistry. The graduates were divided as follows: Philadelphia Dental College, 41; Pennsylvania Dental College, 78; Hahnemann Medical College, 53; University of Pennsylvania (Medical Department), 127; Jefferson Medical College, 203; College of Pharmacy, 97; Woman's Medical College, 17.

INFANT MORTALITY.—The *Lancet* for February 23 takes notice of a startling statement recently made by Dr. O'Hanlon, at an inquest on the bodies of two children at Durham, England, which is susceptible of a very sinister interpretation. The witness stated that there had been a great advance in the percentage of mortality among children, owing, he intimated, to the fact that the children were always insured, the surgeon having generally to give three or four certificates to insurance companies for every child's death. "The waste of infant life," adds the *Lancet*, "in some of the midland counties has before now been observed, and appears greater than can be accounted for by disease, bad management, and errors of diet," and deems it highly desirable that where there is even the faintest doubt as to the cause of death, the medical attendant should decline to give a certificate without first resorting to a post mortem examination.

NECROLOGY.—The French *Académie des Sciences* has recently lost two of its most distinguished members, Drs. Brequerel, Sr., and Regnault. The first, after a long life of labor and scientific activity, succumbed in his ninetieth year. The second was the father of the artist, Henri Regnault, whose glorious death at Buzenval during the late war was mourned by all lovers of France and the fine arts. The father died on the anniversary of the day on which the son met his untimely end. The last meeting of the *Académie* was adjourned as a mark of sorrow and esteem for the departed members. During the year 1877, the medical profession had to mourn the loss of the following celebrated men: Adams, Barth, Böck, Cazenave, Dietz, Erlenmayer, Fergusson, Fleischer, Gairdner, Gerlach, Girschtoft, Harvey, Heine, Hoffmann, Kergaradec, Landerer, Max Langenbeek, Lederle, Linhart, Londlob, Marx, Mayerhofer, Oesterben, Schuhmacher, Schultze, Skobell, Spazenegger, Valentiner, Volkmann, Wunderlich, Zeller.

HOSPITAL FOR YOUNG EPILEPTICS.—M. Lapryère, formerly editor of the *France Médicale*, has founded at Boulogne-sur-Seine a private hospital especially destined for the reception of young epileptics, but in which rachitic and paralytic children are also received. The hospital has been established less than six months, but its success seems already assured. In the cases of several epileptic children, the results obtained have been very satisfactory.

THE GENERAL HOSPITAL IN VIENNA.—A new bath-room, which contains seven continuous water-beds or baths, has recently been added to this hospital. The continuous water-bath has proved exceedingly valuable in the treatment of certain diseases of the skin, and still more of desperate surgical cases, such as severe burns, and phagedenic ulcers, etc. The patients find themselves very comfortable in the bath, which usually relieves pain rapidly even when severe. The baths are so arranged that the patients can sleep com-

fortably, and move about in them without difficulty—a very essential point when the sufferers are obliged to remain constantly in them for months at a time. The additional facilities afforded by the new bath-room for the administration of these baths, are a valuable addition to the therapeutic resources of the hospital, and deserve the careful consideration of all hospital authorities and practical surgeons.

Sanitary Protection Association.—A sanitary protection association has been started in Edinburgh. It has for its objects the following: "1. To provide its members at moderate cost with such advice and supervision as shall insure the proper sanitary condition of their own dwellings. 2. To enable members to procure practical advice on moderate terms as to the best means of remedying defects in houses of the poorer classes, in which they are interested. 3. To aid in improving the sanitary condition of the city by following such course as in the opinion of the council may seem calculated to promote this object."

Medical Affairs in Montenegro.—Dr. Studitzki, in a letter to the *St. Petersburg med. Wochenschr.*, makes some astounding statements concerning the state of medical affairs in Montenegro. According to him, all the educated surgeons in the Montenegrin army are foreigners, the greater number of them being Russians. There are absolutely no native, educated physicians, the entire medical practice of the country being in the hands of the Jlitschkowitsch family, whose scanty knowledge of the healing art has been handed down from father to son for generations. At the present time ten members of this family are engaged in the practice of military surgery, and they follow in every respect the methods and rules of treatment prescribed by their forefathers. These consist principally in the use of splints for fractures, in frequent cauterizations of fresh wounds with lapis, and in drainage of gunshot wounds with "cotton wick." They are very weak in anatomy, and for fear of hemorrhage avoid all extensive and delicate operations. The only operations which they perform are extirpation of hypertrophied cervical glands, extraction of foreign bodies and trepanation. This last operation is very frequently performed, because every trifling injury to the head is regarded as an indication for trepanning. Sometimes four or five trepanations are performed on the same individual. The court-physician of Nicolas is a Frenchman, but his services are never employed by the people.

Air as a Cause of Disease.—Two addresses of allied import, one by Prof. Donaldson, of the University of Maryland, on "House Air as the Cause and Promoter of Disease," and the other by Dr. W. H. Byford, of Indiana, on "The Hygienic Conditions of the Present Condition of Society," are curious illustrations of a habit that should not be much indulged in medical literature—that of talking when one has very little to say. Prof. Donaldson, whose paper is reprinted from the report for 1877 of the Maryland State Board of Health, gives, however, one of those lucid and excellent *résumés* of the subject which are almost as valuable as original work, and concludes with suggestions of a practical bearing as respects the ventilation and sanitary inspection of houses. He says truly that neither diphtheria, scarlet fever, nor any other zymotic disease could make headway, if householders would only let plenty of fresh air and sunlight into their houses, and attend to their sewerage. He forgets, however, to tell where in crowded cities plenty of fresh air is to be found, particularly in a condition of the streets such as is not uncommon in the leading centres of population in this country. Of course, efficient drainage, street cleaning, and sewerage systems may reduce the external impurity to a minimum; but there are many things in a large city, and one of them is the apathy of the public, that prevent efficiency in these respects, and render it difficult for a board of health to enforce even the most essential precautions. So that, after all, the question finally becomes one of legislation—of medical jurisprudence.

Dr. Byford's pamphlet is scarcely as moderate in its terms as Prof. Donaldson's, and consists, for the most part, of a very sweeping criticism upon our habits of living. It seems scarcely possible that the former can be in earnest when he says that "the busy men—the men who perform the intellectual work that contributes to and makes the present state of civilization what it is—the authors, editors, divines, doctors, lawyers, inventors, manufacturers, traders, and other business men, are so stimulated by the ambitious spirit of the times, that they are worn out while yet young, and die the victims of apoplexy, paralysis, softening of the brain, or some other of the manifestations of an over-worked brain." This is certainly an explicit statement, and yet, when the statistics of longevity are studied, it will be found that the classes named by Dr. Byford are the long-lived classes of modern society rather than the short. Dr. Byford's criticism on the use of stimulants, narcotics, and sedatives, is, however, one that can be commended to the attention of readers, although even here he overstates the matter a little.

Preventing Cremation.—A bill has been introduced in the Pennsylvania legislature for the prevention of cremation. At the same time another bill was offered making it a penal offence for one man to ask another to take a drink of any intoxicating liquor. Both propositions seem to be on a par as to absurdity.

Dr. W. A. Hammond.—The bill to reinstate Dr. Hammond as Surgeon-General and place him upon the retired list has passed the Senate and the House of Representatives. It now merely awaits the approval of the President.

The Late Dr. E. R. Peaslee.—The Board of Governors of the Woman's Hospital in the State of New York, at their meeting held 12th inst., unanimously adopted the following minute for record and transmission to the family of Dr. Peaslee:

"Edmund Randolph Peaslee was a man of rare acquirements, of untiring industry, of great clearness of perception, and of singular purity of life. As a medical writer and practitioner none stood higher, and few were his equal in the various departments of medicine and surgery which bound him to the Woman's Hospital.

"In the midst of his busy professional life, Dr. Peaslee found time to interest himself in literature, the advance of science, and the moral and religious efforts of the age. A character thus broadened and filled out made its possessor a leader among his professional associates, and a wise and valued citizen.

"This institution has lost in his death an eminent and conscientious officer, a kind friend and adviser."

Diphtheria and Lactic Acid Spray.—Dr. H. Beyer, of Long Island City, L. I., reports two successful cases of severe diphtheria cured by the local application of dilute lactic acid in the form of a spray. He recommends its adoption in all desperate cases.

To the Medical Profession.

LACTOPEPTINE,

The most important remedial agent ever presented to the medical profession for Indigestion, Dyspepsia, and all Diseases arising from imperfect nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase or Veg. Ptyalin, Lactic and Hydrochloric Acids, in combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk,	40 ounces.	Veg. Ptyalin or Diastase,	4 drachms
Pepsin,	8 "	Lactic Acid,	5 fl. "
Pancreatine,	6 "	Hydrochloric Acid,	5 fl. "

Powder and Mix.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its present sale exceeds $100,000 per year at wholesale. Its almost universal adoption by the profession, as the above figures show, is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned, having tested REED & CARNRICK'S preparation of Pepsin, Pancreatine, Diastase, Lactic Acid, and Hydrochloric Acid, made according to published formula, and called LACTOPEPTINE, find that in those diseases of the stomach where the above remedies are indicated, it has proven itself a desirable, useful and well-adapted addition to the usual pharmaceutical preparations, and therefore recommend it to the profession.

NEW YORK, *April 6th*, 1875.

W. H. Schieffelin & Co.'s

SOLUBLE QUININE PILLS.

We would be glad to have *any* of our Soluble Pills subjected to intelligent test; but as the medicine most in demand in pilular form is Quinine, we particularly court a critical examination of our Quinine Pills, and desire that they be subjected to the test either of analysis or of therapeutic effect.

This scrutiny is invited with confidence, as we invariably use *bleached* Sulphate of Quinine, of the best American brands, in full and exact weights, and because we have never heard of a case where our pills failed to produce the effect which would have been obtained from an equal quantity of Sulphate of Quinine in its usual form.

In order to facilitate an analysis, we suggest the following process as simple and reliable.

Remove the coating from pills representing say 20 grains of Quinine, Separate excipient by rubbing them in a mortar with 2 ozs. water until perfectly smooth, and then dissolving by aid of a few drops of dilute Sulphuric Acid and filtering. Treat the filtrate with aqua ammoniæ in excess and filter again. Wash the precipitate left on the filter, by passing 1 oz. water through it. Dry on filter by gentle heat. Subject 10 grains of it to the

TEST FOR QUININE,

Published in the *U. S. Pharmacopœia*, as follows:

"When ten grains of the salt are agitated in a test-tube with ten minims of officinal water of Ammonia and sixty grains of Ether, and allowed to rest, the resulting liquid separates into two transparent and colorless layers, without any white or chrystalline matter at the surface of contact."

Any such matter floating there would indicate the presence of Cinchonia, Cinchonidia, or Quinidia.

We are happy to announce that the recent decline in the price of Quinine enabled us to reduce the price of the pills; as may be seen by referring to our latest Price-Lists.

LAZELL, MARSH & GARDINER'S
POWDERED
MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory; and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them. Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts.*

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz

A FULL LINE WITH OUR AGENTS:

GILMAN BROS, Boston. MORRISON, PLUMMER & CO., Chicago. RICHARDSON & CO., St. Louis. CRANE & BRIGHAM, San Francisco. BULLOCK & CRENSHAW, Philadelphia. W. H. BROWN & BRO., Baltimore. A. McClure & Co., Albany.

SOLUTION DIALYSED IRON.

A pure neutral solution of Ferric Oxychloride (Fe_2Cl_3, 23 Fe_2O_3), which will keep without change.

CITRATE OF IRON AND CINCHONIDIA,

A new Scale Salt of value, and which is asserted to equal in medicinal value, Citrate of Iron and Quinine. It is freely soluble, and adapted for use either in solution or pill.

We do not propose in this place to give an extended list of our products, but would mention that we *always furnish our own manufacture* of any of our laboratory products, unless other manufacture be specified. Nearly every one of the "Officinal" preparations of the U. S. Pharmacopœia, 1873, can be supplied of our own manufacture, besides most of the non officinal remedies in use.

McKESSON & ROBBINS, NEW YORK · TRADE MARK. · M'F'G. CHEMISTS

NEW THERAPEUTICAL NOTES.

CHARCOAL, WILLOW, ... 5 grs.

The value of pure powdered Willow Charcoal in Dyspepsia, Indigestion and all affections arising from derangements of the stomach, such as Headache, Heartburn, &c., is well known. Its value must necessarily be much increased, since it is, for the first time, presented in a convenient, reliable and unobjectionable form, in our Gelatine-Coated Pills.

IRON, DIALYSED, ... 2 grs.

Made from Merck's scales or plates of Dialysed Iron, and, about 20 times the strength of the Solutions in market.

SALICIN, ... 2½ and 5 grs.

Salicin is becoming more and more favorably known in the treatment of Rheumatic affections, also as a Tonic, Astringent, and Anti-Periodic, and is best exhibited in our Gelatine-Coated Pills. In Acute Rheumatism, Salicin has been found very efficacious, and according to "The Lancet," not less certain, than Quinine is for the Ague. In large doses, it has been claimed to be an absolute specific in Cornëitis (suppurative). Price, reduced.

MONOBROMATED CAMPHOR, ... 2 and 3 grs.

Is now being considerably used in treatment of Spermatorrhœa; strongly recommended in cases of Cerebral-Anæmia; used successfully in Infantile Convulsions from teething; Hysteria; Headache from over study or nervousness, and Nymphomania. (Dose, 3 to 4 grs.)

CALCIUM, SULPHIDE, ... 1-10 gr.

Strongly recommended "in cases of Scrofulous and other unhealthy sores, Glandular Enlargement, Boils occuring in crops, &c." In many skin diseases, it is strongly indicated, being not only Anti-parasitic and Anti-herpetic, but also stimulant and tonic.

An eminent physician, who has given much attention to the use of Sulphide of Calcium and cites several very interesting cases of cures of Abscesses, through its medium. In his words: "The Sulphide of Calcium is indicated in Scrofulous and unhealthy sores and Glandular Enlargements, in Boils appearing in crops, and in carbuncles—in any diathesis with a tendency to Abscesses with suppuration."

CERIUM, OXALATE, ... 1 gr.

Used as a remedy in the sick stomach of pregnant women, and in the vomiting of pregnancy, as well as in Phthisis, Hysteria, Pyrosis and Atonic Dyspepsia. (Dose, 1 to 3.)

PHOSPHORUS, ... 1-100, 1-50, 1-30, 1-20, 1-12 gr.

The pure transparent Gelatine we use is in no degree porous, it preserves the Phosphorus perfectly in the free state; while sugar, owing to its crystaline nature, is very porous, and will admit of rapid change in substances, of a delicate character, covered with it. We have the Phosphorus in state of solution in the excipient we employ, this insures a gradual elimination of the Phosphorus in the stomach, thus avoiding the severe irritation that is so often experienced after taking the ordinary Phosphorus Pills, which are prepared by mixing the Phosphorus in substance with the excipient, in which small fragments of Phosphorus often remain. Note remarks by Dr. Squibb, in his paper before Am. Pharm. Ass'n, Sept., '76, in which he states that Phosphorus should never be administered in substance, and if a coating be used, he commends Gelatine.

Many of the most eminent physicians throughout the country, among whom are leading specialists in the treatment of Neurotic diseases, assert that McKesson & Robbins' Phosphorus Pills are the most rational medium yet found for exhibiting Phosphorus.

PHOSPHORUS COMPOUND, McKesson & Robbins' Pills, 1/50, 1/10 & 1/100 gr.

PHOSPHORUS COMPOUND AND IRON, McKesson & Robbins' Pills.

Every drug and chemical used in McKesson & Robbins' Pills are thoroughly tested by a competent chemist, and the Pills repeatedly analyzed to prove correctness in the synthesis.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL, and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist,

Explanatory Circular mailed on application.

(P. O. Box 4,517), 2 and 4 Platt Street, New York.

Peck's Cod-Liver Oil and Wild-Cherry Bark.

Unequalled for rapid and efficient action in **Phthisis, Deficient Nutrition, etc.** Agrees with the most delicate stomach, never causes eructations, is a positive tonic. Its taste is far more agreeable than that of any other combination. It is a perfect emulsion of fifty per cent. of oil and twenty-five per cent. of bark, from which the oil does not separate, and which keeps indefinitely without change.

Dr. W. L. ATLEE, Jr., Philadelphia, writes:—"I have used your Ol. Morrh. cum Prun. Virg. in upwards of a hundred cases. The results were invariably satisfactory and very much better than I ever obtained with other preparations of Cod-Liver Oil."

Peck's Elixir of Phosphorus.

For **Paralysis, Melancholia, Lapse of Memory, etc.** A powerful Aphrodisiac. A clear, permanent, palatable solution, containing $\frac{1}{100}$ gr. unaltered Phosphorus in each teaspoonful.

Sold by apothecaries generally.

H. T. PECK & CO., Chemists, Philadelphia.

MELLIN'S FOOD

For Infants and Invalids,

— FOR THE —

Healthful Rearing of Hand-fed Children & the Preservation of Infant Life

AND FOR THE NOURISHMENT OF INVALIDS WHO CANNOT DIGEST ORDINARY FOOD.

Price, $1.00 per Bottle. Trial Size, 60 cents. For Sale by Druggists.

MELLIN'S FOOD IS **ENTIRELY SOLUBLE AND NOT FARINACEOUS.**

We will furnish a sample of Mellin's Food free to any physician who may desire to try it in his practice. Send for a pamphlet on "Infants' Food," etc., containing Analysis, Testimonials, etc.

Pneumatic Aspiration

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:

Fig. 68.

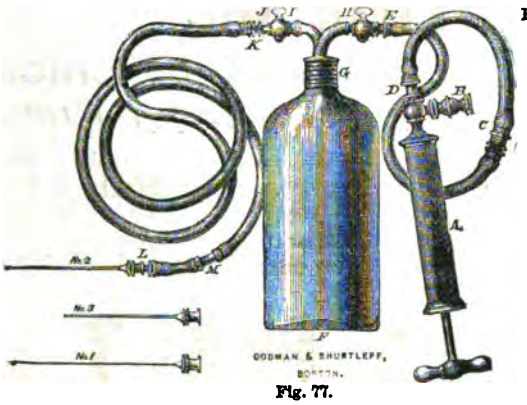

Fig. 77.

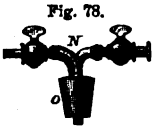
Fig. 78.



The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration.

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold-plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions.....$18 00

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78), to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions, 16 00

No. 3. Dieulafoy's Notched Aspirator, Nickel-plated, with two Needles, Tubes, etc., in case.....$14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional..... 6 00

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of..... 3 40

☞ *Full description on application.*

An Illustrated Catalogue of Surgical Instruments, also a New Pamphlet on Atomization of Liquids, with description of Improved Apparatus and Formulæ of Remedies successfully employed, will be forwarded, post-paid, on application.

CODMAN & SHURTLEFF,

Makers of Surgical Instruments,

13 and 15 Tremont Street, Boston.

N.B.—See our other Advertisement in alternate numbers of the RECORD.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

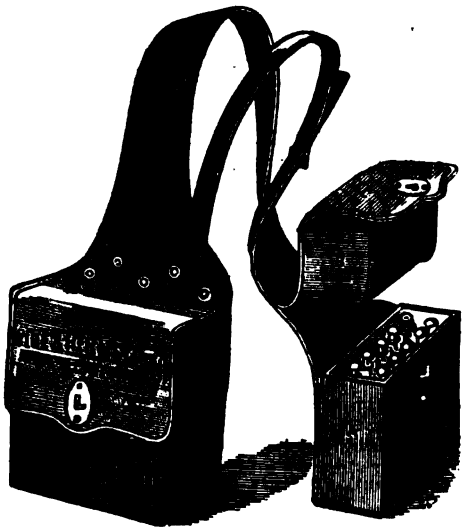
ALOE & HERNSTEIN'S
IMPROVED
PHYSICIAN'S SADDLE BAG.



This Bag is the most complete and durable Bag in the Market, and will give the best satisfaction to the Profession of any Bag ever offered. The Bag is entirely riveted with copper rivets, thereby doing away with the old style of sewing, which has been the great objection heretofore. The boxes containing the bottles are made of the best Tin Metal. A, is the metal box containing the bottles; B, is the box used to carry instruments, powders, etc.; C, is the flap, which holds the upper and lower boxes, A and B, firmly together, being fastened by a turn lock, which holds the contents in their places; D, represents the bag when closed. It is the only bag made that has a complete water-shed to prevent the contents from getting wet.

PRICES.

For Bags containing 20 Ground, Stoppered Vials $12 00
" " 24 " " " 13 00

Made of the best Black Bridle Leather.

For Bags containing 20 Ground, Stoppered Bottles $13 00
" " 24 " " " 14 00

Made of the best Russet Leather.

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the NORTH EASTERN DISPENSARY, is obtained in its purest form, under the immediate direction of Dr. WARREN SCHOONOVER, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end), *20 cents*
Seven " " " " " *$1.00.*
Crusts, (Humanized, first removal from heifer.) each, . . *2.00.*

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of inquiry may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free. Remittance should accompany the order. A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases—such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Printed Pills and Granules

These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of accuracy, and a safeguard against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacists rests on the entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline: Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal:

Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

CORRESPONDENCE SOLICITED.

TO PHYSICIANS.

THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissue of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving results of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, Wool Exchange, Coleman Street, London, E. C., England.

To be had of **CASWELL, HAZARD & CO., New York,** and of all respectable Chemists throughout the world.

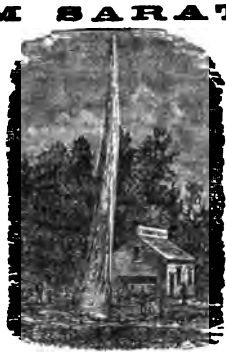
CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.



THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties: it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case..... $9 00
Quarts, 2 dozen in a case..... 7 00

In Saratoga. *Delivered at the Cars.*

MEDICINAL TRITURATIONS

—AND—

Fresh Plant Essences.

TRITURATIONS.

We have prepared and put on the market since a number of years Triturations of Minerals, Chemicals, Metals and other Medicinal Substances, which are carefully triturated with purified Sugar of Milk, for one full hour at a time, in the proportion generally of one in ten, or one in one hundred; and it is found that by this process the action of the remedies is rendered more prompt and effective, even in minute doses, than when prescribed in the usual form in larger quantities.

Fresh Plant Essences.

Tinctures made in the usual manner, from dried roots and herbs, are variable in their effects—are often found untrustworthy. It is conceded that in drying many plants and roots lose most of their volatile constituents, and some even undergo a decided change. A case in point is Hydrastic Can., the fresh root of which possesses narcotic properties which in the dried are wanting. It is at all times difficult to detect old from freshly-garnered dried plants; hence, often old and chapworn materials are used, sometimes from sheer carelessness, more often from necessity.

To obviate this difficulty, we procure of all remedies indigenous to this country, the fresh plants or roots when in their full vigor, and carefully prepare therefrom essences or tinctures, which retain their full efficacy unimpaired for years, many indeed claiming that age, as in wines, improves their quality.

Of medicinal plants indigenous to Europe, we import the essence ready prepared. The exact proportion of fresh plant or root to the tincture or essence is given with each bottle, so as to enable the practitioner to accurately determine the quantity administered.

These standard preparations are furnished in original packages, from one ounce to one pound, each bottle having our firm's name blown into the glass, the cork being secured by a metallic capsule, also bearing the firm's name.

Physicians can order either direct or through their Druggists, who can readily procure our goods through the jobbing houses.

Explanatory price currents, with lists of such preparations as we carry in stock, furnished free on application.

ADDRESS,

BOERICKE & TAFEL,

Manufacturing Pharmacists,

No. 145 GRAND ST., NEW YORK.

CONCERNING

BELLADONNA PLASTER

A Few Words to Physicians and Surgeons.

BY A PHYSICIAN.

Until quite recently Manufacturing Chemists, in offering new combinations and improvements in Pharmacy to the Medical Profession, have found the Faculty very hospitable to the introduction of improvements adapted to their use.

But within a short time, conscientious Physicians have begun to discuss among themselves, very seriously, the propriety of welcoming the newer products of Pharmacy.

Why is this?

Because it is found that certain manufacturers, appealing to the convenience and profit of the apothecary, have been sacrificing merit and therapeutic value to elegance of appearance, and have employed officinal forms and professional nomenclature to foist upon the physician, by aid of the druggist, compounds of little or no value, and altogether unworthy of the high claims made for them.

Thus, the manufacture of medicinal agents for the use of Physicians is rapidly degenerating into empiricism, and is becoming almost as objectionable as the ordinary clap-trap of the "patent medicine" business.

Notably is this true with reference to that important and useful agent, *Belladonna Plaster*.

DR. J. M. GROSVENOR, graduate of Dartmouth, was the first to appreciate and turn to practical account, an improvement in compounding Belladonna Plaster by using purified rubber as a basis of combination.

His experiments in affecting the combination in therapeutic and mechanical perfection were long continued, exhaustive and expensive.

But he finally succeeded perfectly, and his improved Belladonna Plaster was everywhere welcomed by the Faculty, as being the best form of this agent yet presented. It was universally adopted as the standard Belladonna Plaster.

Why?

Because it proved to be an entirely reliable preparation — presenting the drug uniformly, accurately, and with the most precise and skilful attention to convenience and activity.

The widespread popularity of Dr. Grosvenor's Improved Belladonna Plaster at once attracted the cupidity of empiricism, and the drug market was soon flooded with so-called "Belladonna" Plasters, branded "U.S.P.," and offered to Druggists upon one recommendation, *namely:* "It is 50 per cent. cheaper than Grosvenor's!"

A good many gudgeon-like dealers promptly took the bait, and before long physicians began to express surprise and chagrin because Belladonna Plaster did not respond to their expectations in its effects as formerly.

Dr. Grosvenor found himself in receipt of numberless indignant communications upon the subject.

Belladonna Plaster is sold to the druggist in yard rolls, enclosed in a tin case. He cuts it into strips for dispensing as the physician may order.

The mechanical appearance and characteristic odor of Dr. Grosvenor's Improved Belladonna Plaster were closely simulated in the empirical articles; and if the druggist saw fit, for his own profit, to deceive the physician, the latter had no means of detecting the imposition except by noting the effect, and thus it happened that for a long time Dr. Grosvenor's legitimate and always reliable product had to bear the odium belonging justly to the empirics who had assailed him by simulating his article.

Finally he adopted, for the protection of the profession, the expedient of stamping his name at short intervals across the back of his "Belladonna Plaster" in violet ink, but omitting the words "Belladonna Plaster," for reasons which practitioners will understand.

Thus the fraud was checked, wherever the Faculty were informed of the precautionary measure; and the object of this article is to ask physicians everywhere to observe this test of genuineness, and in prescribing, to write for "*Emp. Belladonna Grosvenori.*

The true Belladonna Plaster in rubber combination will always bear this guarantee of genuineness—J. M. GROSVENOR, M.D., (accompanied by a "trade-mark," consisting of a Belladonna Leaf, with the letters B and P upon it in monogram), printed in *fac simile*, at intervals of three inches across the back of the plaster in violet ink.

The profession are reminded that a true Belladonna Plaster, accurately prepared, *cannot* be a *cheap* product. Dr. Grosvenor originally sold his Plaster at the lowest practicable price, and that price has never been changed. Any plaster professing to contain the same elements that is sold at any price considerably lower, stamps itself at once as being the work of quackery.

Dr. Grosvenor has prepared a brief treatise upon Belladonna Plaster, which will be mailed (with sample of plaster) to any physician desiring it.

Physicains, if unable to obtain Dr. Grosvenor's improved Belladonna Plaster at their drug stores, will be supplied direct from the laboratory, by mail, upon receipt of one dollar. This concession is made to physicians only, and to those who cannot obtain the veritable article at home.

Address,

J. M. GROSVENOR, M.D., *22 Park Place,* **NEW YORK.** or **GROSVENOR & RICHARDS,** *97 Oliver Street,* **BOSTON.**

SOLUBLE TABLETS, TABLET TRITURATES, PILL & TABLET SATURATES

MADE ACCORDING TO DR. ROBERT M. FULLER'S METHOD.

These tablets, from their ready solubility or diffusibility, are destined to come into general use in the profession. Their advantages can be appreciated at once when they are allowed to dissolve in the mouth or in a teaspoonful of water. They are readily soluble in the mouth or stomach, or diffusible in a teaspoonful of water, and thus administered.

We make the following abstract from an address read by Dr. ROBERT M. FULLER, before the New York Academy of Medicine, and published in "The Medical Record" March 9th, 1878, in which he makes known an accurate method he has devised for dispensing certain medicines in separate doses, in a compact and palatable form:

"The inability frequently experienced by physicians to obtain certain medicines, in separate doses, of a desired formula and mode of preparation led me, some time ago, to undertake a series of pharmaceutical experiments with a view of contriving some simple, inexpensive and readily available method of preparing the medicines so desired."

"After a number of varied and careful experiments, I succeeded in devising four methods of preparation."

"The preparations in question I have named *soluble tablets, tablet triturates*, and *pill* and *tablet saturates*, the former being designed for any powders which are to be administered in certain required doses, and the latter for certain fluid extracts, or other standard concentrated solutions."

"*Physicians practising in the country, to whose use they are adapted by reason of their economy, dose-accuracy, compactness, and palatable form for dispensing, will find them almost indispensible.*"

"The SOLUBLE TABLETS generally consist simply of certain medicines made into soluble paste with the aid of sugar of milk, and alcohol, or water. The tablets are intended to embrace any medicines that can be made into a paste which is not too tenacious, such as fluid extracts, or sugar of milk containing *any* per cent. of chemical, such as arsenious acid, sulphate of morphia, muriate of ammonia, etc."

"The TABLET TRITURATES consist of triturations of metallic, mineral, and vegetable medicines. These triturations, with sugar of milk, are mixed with alcohol of any per cent., or water, according to the adhesiveness required, and the paste thus formed is then readily made into tablets of any size."

"The TABLET SATURATES are merely porous troches, or tablets designed for saturation. The difference between the tablets and the pills, beyond the difference in shape, being that the former will absorb a much larger quantity of fluid extract, or other standard concentrated solution, than the latter."

"The PILL SATURATES possess two favorable qualities, namely: they are made easily, and at an extremely low cost. Either of the above are of various sizes, and sold by the ounce or pound, for medication."

☞ We have these tablets either medicated or plain, for medication, and can supply physicians with them. Medicated according to any formula desired, and will make special rates when 100 or upwards are ordered.

CASWELL, HAZARD & CO.,

Fifth Ave., cor. 24th St.; & Sixth Ave., cor. 39th St., New York.

McKESSON & ROBBINS'
GELATINE-COATED PILLS.

COCA EXTRACT, 1 gr.

Made from freshly imported leaves. As the leaves become almost inert with age, a preparation of this nature is necessary to enable the Physician to judge correctly of the value of this remedy. Coca Erythroxylon is a South American plant, used by the natives as a substitute for tea, coffee, tobacco, hashish and opium of other countries. It imparts vigor to the muscles as well as to the intellect, and enables the partaker to endure great fatigue with ease. The feeling of exhilaration accompanying its use, is said not to be followed by any depressing effects.

ERGOTIN, 3 grs.

Each pill is equal to half a teaspoonful of officinal fluid extract. The value of Ergotin, in the place of the crude drug and the Fluid Preparations, is conceded; and it is being largely administered both in this country and in Europe.

GRINDELIA ROBUSTA EXTRACT, 3 grs.

The Solid Extract is ten times the strength of the Herb; it can be used much more readily and with better effect than any of the liquid preparations. The use of this remedy in Hay Fever, and all Asthmatic difficulties, has increased largely in the Eastern States and Europe, and its therapeutic value is conceded. (Dose, 1 to 3.)

GUARANA EXTRACT (PAULLINIA), 3 grs.

The Solid Extract is eight times the average strength of the drug. The value of Guarana, in many phases of sick, nervous and sun Headache, as well as in Neuralgia, and in irritations of the mucous membrane, has become well-known to practitioners, and its happy effects in Diarrhœa, Dysentery and kindred diseases, have been attested in numerous cases. (Dose, 2 to 3.)

JABORANDI EXTRACT, 3 grs.

These pills present a much better and more acceptable form of administering this powerful Diaphoretic and Sialagogue, than any of the liquid preparations. Valuable in Rheumatism and all Syphilitic troubles of long standing. (Dose, 1 to 3.)

CALCIUM SULPHIDE, 1-10 gr.

Strongly recommended "in cases of Scrofulus and other unhealthy sores, glandular enlargement, boils occurring in crops, &c." In many skin diseases it is strongly indicated, being not only anti-parasitic and anti-herpetic, but also stimulant and tonic.

SALICYLIC ACID WITH MORPHINE.

{ Acid. Salicylicum, 2 1-2 grs.
{ Morphiæ Sulphas, 1-12 gr.

SALICYLIC ACID WITH MORPHINE.

[Acid. Salicylicum, 5 grs. Morphiæ Sulphas, 1-8 gr.]
Strongly recommended in Rheumatism, both acute and chronic.

SANDAL WOOD EXTRACT, 1 and 2 grs.

These pills contain both the oil and resin existing in Sandal Wood, are believed to be superior to the oil alone, and are more convenient of administration.

IRON, DIALYZED, 2 grs.

Made from Merck's scales or plates of Dialyzed Iron, and about twenty times the strength of the solutions in market.

I have in stock every Gelatine-Coated Pill made by McK. & R.

T. H. SAYRE, Dispensing Chemist,

Sixth Avenue, cor. 46th Street, New York.

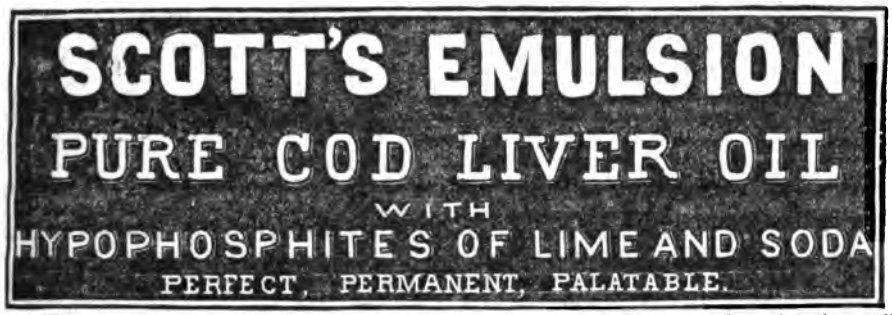
Soluble Quinine Pills.

See Page 3 for Advertisement of

W. H. SCHIEFFELIN & CO.



FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

Pullna Bitterwater.

The only Bitterwater that received the Prize at the International Exhibition in Philadelphia in 1876.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

Children are equally benefited by it, and it is prescribed for them in doses of a tablespoonful in milk at night, either cold or warm.

PRICE.—Case of 20 Pint Jugs.....$3.25 by
" Case of 50 Pint Jugs..... 8.00 "
Less discount according to quantity.

FOR SALE BY ALL DRUGGISTS.

Quotations for quantities may be had, as well as circulars, free from

P. SCHERER & CO.,

IMPORTERS OF

PULLNA and all other EUROPEAN MINERAL WATERS,

72 & 74 Park Place, New York.

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 13, 1875.)

Please specify, in ordering from any wholesale house, **Warburg's Tincture,** made by **F. A. REICHARDT.**

Price per bottle, 1 oz., **75c.**; per doz., **$5.00.** Per pint, **$5.00**; per doz., **$50.00.**

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynecologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

F. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ½ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen; **$10.00** per gross.

Works on Materia Medica and Therapeutics.

THE ESSENTIALS OF MATERIA MEDICA AND THERAPEUTICS.

By ALFRED BARING GARROD, M.D., F.R.S., Fellow of the Royal College of Physicians, etc., etc.

Second edition, revised and much enlarged. One handsome 8vo volume, extra muslin. Price $4.00.

"The work of Dr. Garrod supplies a want that has long been felt on this side of the Atlantic. The editor has confined himself to supplying a few of the omissions of Dr. Garrod, and to indicating where a differences exists in the preparations of the Pharmacopœia of the United States. His aim has been to make such additions only as are strictly necessary for the American student.

"The author of this book has succeeded admirably in placing in concise form what is necessary to be known of Materia Medica and Therapeutics, leaving it to larger works to enter into details."—*Medical and Surgical Reporter.*

"We have here a brief *résumé* of Materia Medica, all non-essential parts being omitted. It might be called a commentary on the Pharmacopœia, as it somewhat resembles Phillips' commentary on the London Pharmacopœia, though more extended in its descriptions of the action and uses of remedies."—*Eclectic Medical Journal.*

A YEAR-BOOK OF THERAPEUTICS, PHARMACY, AND ALLIED SCIENCES. 1872 & 1873.

By H. C. WOOD, Jr., M.D.

In handsome octavo volumes, bound in extra muslin. Price $2.50 *each.*

This "Year-Book" is made up from the pages of "New Remedies," and contains all the more important articles which have appeared in that journal during the past year, together with a few new ones. It will be published annually for the benefit of those who prefer to purchase the very valuable material it contains in this form rather than in unbound numbers as a periodical. A complete index has been added.

SIXTH EDITION—GREATLY ENLARGED.

A HANDBOOK OF THERAPEUTICS.

By SIDNEY RINGER, M.D., Prof. of Therapeutics in University College; Physician to University College Hospital.

In one 8vo volume, handsomely bound in extra muslin. Price $4.50.

"The author has selected everything of substantial value among the recent advances in Therapeutics. It is a practical work, replete with interesting and reliable information, and will be found to be one which can be consulted by the practitioner with much benefit. We would advise every young physician to procure and read the book. It fills all the author claims for it in letter and spirit, and is written in such a clear and simple style that all who read it will do so with pleasure."—*Western Lancet.*

"The author, as we have said, designed the book simply as an introduction to Therapeutics for the use of students and young practitioners. That to such it will be found most useful there is no doubt; but we are also sure that from the mass of valuable, readable, and well-arranged information it contains, and the numberless minor practical hints scattered throughout its pages, the work will be almost equally useful to the busy practitioner; and that it will receive from the profession generally the warm welcome which it deserves."—*British Med. Jour.*

"We can scarcely doubt that the present edition will be quickly sold."—*The Practitioner.*

"A very suggestive and useful work on therapeutics."—*St. Louis Med. and Surg. Journal.*

THE ELEMENTS OF THERAPEUTICS.

A CLINICAL GUIDE TO THE ACTION OF MEDICINES.

By Dr. C. BINZ, Professor of Pharmacology in the University of Bonn.

Translated from the Fifth German Edition, and edited, with additions, in conformity with the British and American Pharmacopœias.

By EDWARD I. SPARKS, M.A., M.B., Oxon.

Member of the Royal College of Physicians of London, Officier de Santé (Alpes Maritimes), France, formerly Radcliffe Travelling Fellow.

In one handsome 12mo volume, bound in extra muslin, price $2.00. *Sent by mail, free of postage, on receipt of price.*

"This work contains much valuable information, especially in regard to those remedies which exert an influence on the nervous system."—*St. Louis Med. & Surg. Journal, Feb.*, 1878.

"The desire to know how a medicine acts is just beginning to attract the attention it deserves. This work gives a clear description of the therapeutical action of medicines in a way that is sure to command attention and cause a more thorough investigation in this branch."—*Cincinnati Lancet and Observer, Feb.*, 1878.

"The work appears to have been written with great care, and bears the impress of reliability; and is a volume that we do not hesitate to recommend in the strongest manner."—*The Medical Record, Jan.* 12, 1878.

"The book is in every respect excellent. It is a judicious condensation of practical, useful facts, educed from physiological experiment and clinical observation."—*Am. Practitioner, Feb.*, 1878.

"The most striking features of the work are the conciseness with which the author expresses what is known on each subject, and a style which gives the subjects a freshness not commonly found in text-books on therapeutics, or in lectures on this topic."—*New Remedies, Jan.*, 1878.

"It is, on the whole, more trustworthy than the average text-book. In fact there is little in it that should be neglected by the medical student. We regret that such a work was not available during our own student days."—*Detroit Lancet, Feb.*, 1878.

STUDIES IN PATHOLOGY AND THERAPEUTICS.

By SAMUEL HENRY DICKINSON, M.D., LL.D., Professor of Practice of Physic in Jefferson Medical College, Philadelphia, etc., etc.

In one handsome 12mo volume, neatly bound in extra muslin. Price $1.50.

"Mr. Dickson may be styled a medical philosopher, in the best sense of the term. He thinks independently, and has done a vast amount of good thinking in the 200 pages composing the 'Studies.' There are few writers who find the *middle way* so successfully. He shows no bigoted affection for the old, nor any shallow, pedantic passion for the new. We give his book a hearty recommendation to our medical brethern. They will rise from its perusal informed and refreshed."—*Pacific Medical and Surgical Journal.*

ESSAYS ON INFANT THERAPEUTICS.

To which are added Observations on Ergot; History of the Origin of the Use of Mercury in Inflammatory Complaints; with the Statistics of the Deaths from Poisoning in New York, in the Years 1841-2-3.

By JOHN B. BECK, M.D.

Third Edition. One very neat duodecimo volume, muslin. Price $1.00.

"A perfect gem. We regard it as one of the most useful books in our library."—*New Jersey Medical Reporter.*

"An excellent little work, from the very highest authority."—*Western Lancet.*

141 W. 54th St., bet. 6th & 7th Aves.

ANNUAL SUBSCRIPTIONS

(*Invariably in advance*), **$10.00.**

By payment of the above annual subscription, the subscriber becomes entitled to the following privileges:

First.—To have admitted in the Hospital for treatment, an unlimited number of horses or other animals, his own property, at a charge only for their keep, medicines included, $1.00.

Second.—To have the opinions of the surgeons in charge as to medical treatment of animals he may desire to retain in his own possession, without payment of fees, and to be supplied with medicines from the hospital at very low rates; but *no free visits* are expected to be made out of the Hospital.

Third.—To have horses examined for soundness, brought in the hospital free of charge.

Apply to A. LIAUTARD, M.D., V.S.,
Chief Surgeon.

"CROMWELL HALL,"

A PRIVATE HOSPITAL FOR THE INSANE

And NERVOUS, recently opened by W. B. HALLOCK, M.D., late First Assistant Physician of the "Connecticut Hospital for Insane."

Refers to A. M. SHEW, M.D., Supt. Conn. Hospital for Insane; SAMUEL LYNES, M.D. (Norwalk, Conn.), late Trustee of the same; J. S. BUTLER, M.D., Ex-Supt. of "The Retreat," Hartford, Conn.; ROBERT HUBBARD, M.D., Bridgeport, Conn.; DRS. E. & E. C. SEGUIN and THOS. R. POOLEY, New York; S. D. BROOKS, M.D. (Springfield, Mass.), Ex-Supt. of the "New York Juvenile Asylum," and the "New York Institution for the Deaf and Dumb;" DRS. H. B. WILBUR and JOHN VAN DUYN, Syracuse, N. Y.

Application may be made to *DR. HALLOCK,* Cromwell, Conn.

PRIVATE INSTRUCTION IN

AURAL DISEASES,

At the NEW YORK EAR DISPENSARY, 400 W. 26th St., cor. 9th Ave

By SAMUEL SEXTON, M.D.

Course, 20 Lessons. Class limited to Five. Fee, $20.00 each.
For further information, inquire at 12 West 35th Street.

SUNNYSIDE.

A PRIVATE MEDICAL HOME FOR NERVOUS INVALIDS.

Washington Heights, New York.

This Home, unsurpassed for its beauty of location and surroundings, and with handsomely furnished apartments, receives a limited number of cases of either sex, of *Mental* and *Nervous Diseases, Dipsomania* and *Opium Habit*, and offers to such patients all the attentions, comforts and attractiveness of a home, together with medical treatment. Applications may be made either by mail or personally at 159d St., bet. 10th Ave. and Boulevard.

Twelve trains daily from Hudson River Depot, 30th St. and 10th Avenue. DR EDWARD C. MANN, M.D., late Medical Superintendent N. Y. State Emigrant Insane Asylum. DR. WM. H. B. POST.

PRACTICAL INSTRUCTION IN

CUTANEOUS AND VENEREAL DISEASES,

AT CHARITY HOSPITAL, BLACKWELL'S ISLAND, N. Y.,

By H. G. PIFFARD, M.D.

Course, 20 Lessons. Class limited to Three. Fee, $50.00 each.
For further information, apply at 10 WEST 35TH STREET, CITY.

FOR SALE.

A well-established Physician's Practice, worth about $4,000 a year. Well located in the Iron Regions of Northern New York. Reason for selling, failing health.

For further particulars, address
"H," THE MEDICAL RECORD, NEW YORK.

THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

(INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors, billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton [L. I.], N. Y.

Instruction, Retreats, Private Hospitals, &c., &c.

TO ADVERTISERS.—Cards inserted, under the above headings, at the rate of 20 cents per line, column width, Nonpareil type. *No Advertisements taken for less than Ten Lines.*

PRIVATE INSTRUCTION IN

PRACTICAL GYNECOLOGY

At MT. SINAI HOSPITAL, OUT-DOOR DEPARTMENT,

By PAUL F. MUNDE, M.D.,

For graduates only. Course 12 lessons of two hours each. Fee $30.00. For further information, apply to

DR. MUNDÉ, 20 West 45th St., New York.

Physician's Office to Let

May 1st. Parlors in West 53d Street, near Elevated Railroad. Elegant brown-stone high-stoop house. Address, I. R. MEYER, 31 and 33 Walker Street. References exchanged.

A MANUAL OF

HISTOLOGY

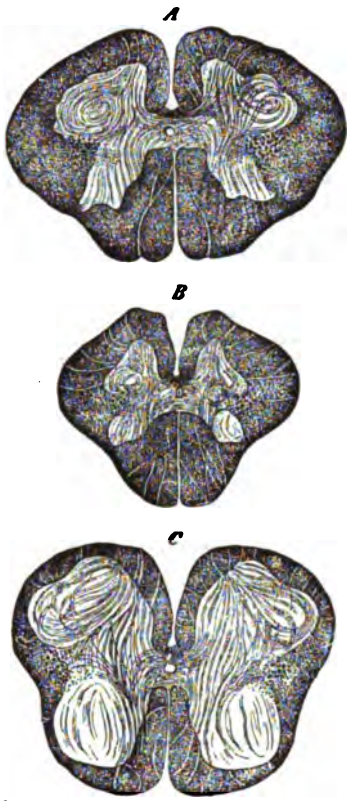
By Prof. S. STRICKER, of Vienna, Austria,

IN CO-OPERATION WITH

TH. MEYNERT, F. VON RECKLINGHAUSEN, MAX SCHULTZE, W. WALDEYER, and others. Translated by HENRY POWER, of London; JAMES J. PUTNAM and J. ORNE GREEN, of Boston; HENRY C. ENO, THOMAS E. SATTERTHWAITE, EDWARD C. SEGUIN, LUCIUS D. BULKLEY, EDWARD L. KEYES, and FRANCIS E. DELAFIELD, of New York. American Translation Edited by ALBERT H. BUCK, Assistant Aural Surgeon to the New York Eye and Ear Infirmary.

A most superb Octavo volume of over 1100 pages, with four hundred and thirty-one illustrations on wood, engraved in the finest style. Richly bound in extra muslin and in the best leather. Price in muslin, $10.00; leather, $11.00.

Sent by mail, postpaid, on receipt of price.



Transverse sections of the spinal cord of a child six months old at various levels. Magnified 8 diam. A, From the middle of the cervical enlargement. B. From the middle of the dorsal region. C. From the middle of the lumbar enlargement.

NOTICES OF THE PRESS.

"At once the most extended and valuable treatise on Histology which has yet appeared."—*Am. Journal of Medical Sciences.*

"The translation of Mr. Power covers 406 pages of the present edition; but the remaining articles are translated by the American gentlemen above named. Nearly two-thirds, therefore, of the book are translated by Americans, who are physicians especially interested in the departments which they have undertaken. In this there is evident advantage, as one who is already familiar with a subject is the more likely to grasp obscure points, which are perhaps rendered still more obscure by being couched in a foreign idiom. There is also likely to be more freshness about an article thus translated than if it form, in the original, one of a large number, and by different authors, translated by a single individual; for the weariness which must necessarily grow upon the translator of so large a volume, is not relieved by the increasing familiarity which he must acquire if the papers are all by the same author.

"This series of papers, edited and in many instances written by Prof. Stricker, constitutes at once the most extended and most accurate treatise on Histology extant. And as the study of Histology is a subject which admits only the latest and most accurate information to its aid, this work must necessarily supersede all others. It becomes, therefore, absolutely indispensable to every histologist and physiologist in the world, as well as to all physicians and surgeons who would pursue their departments with all the light of modern science."—*Phila Medical Times.*

"The need of a work of this kind has been felt for some time past. The last edition of Kölliker contains points which he himself has altered in his later editions, which have not been translated. The publication of this work is destined to give increased zest to the study of minute anatomy, a study which is becoming a necessity to any one who desires to be a thoroughly educated physician.

"We believe this book to be indispensable to any physician who desires to understand the present position of medical science, and to know, if not to find out for himself, the present knowledge of the minute anatomy of the human body. The authors, as remarked before, are men who have devoted themselves to these studies, and do not limit themselves to communication of the facts, but in many places treat of the methods of obtaining good specimens for self-study.

"As for the book itself, it has been published in good style. The type is clear, the wood-cuts are equal to those of the German edition, and there are but few typographical errors."—*The Medical Record.*

"Every medical student and every scientific practitioner should study this work, as, better than any other in the English language, it exhibits what has been demonstrated respecting the minute structure of the body."—*Detroit Review of Medicine.*

N. H. MEDICAL INSTITUTION AT
DARTMOUTH COLLEGE.

The *Eighty-second* Annual Course of Lectures begins Aug. 1, 1878, and continues fourteen weeks. Recitations from Dec. 5 to June 20.

FACULTY:—E. E. Phelps, M.D., LL.D., Practice Emeritus; O. P. Hubbard, M.D., LL.D., Chemistry; J. Ordronaux, M.D., LL.D., Medical Jurisprudence; C. P. Frost, M.D., Practice; P. S. Conner, M.D., Surgery; E. S. Dunster, M.D., Gynecology and Obstetrics; H. M. Field, M.D., Therapeutics; L. B. How, M.D., Anatomy and Physiology.

FEES:—Matriculation, $5; Lectures, $77; Graduation, $25; Recitations, $40.

For Circular, address C. P. FROST, M.D., Dean, Hanover, N. H.

MEDICAL DEPARTMENT OF
HARVARD UNIVERSITY,
BOSTON, MASS.

NINETY-FOURTH ANNUAL ANNOUNCEMENT. (1877-78.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 27th, 1877, and ends the last Wednesday in June, 1878. Persons who hold no degree in arts or science must hereafter pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 24th.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. R. H. FITZ, Secretary, 108 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins February 14, and closes June 25, 1878.

Winter Term begins October 3, 1878; closes January 30, 1879.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $20.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar.

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1877, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

For circulars, address DEAN or REGISTRAR.

An increase of 200 pages additional Reading Matter in a year will be made in

THE AMERICAN JOURNAL OF OBSTETRICS

And Diseases of Women and Children.

PAUL F. MUNDÉ, M.D., Editor.

In consequence of the great increase in the number of subscribers to the AMERICAN JOURNAL OF OBSTETRICS the past year or two, the Publishers take pleasure in announcing that, beginning with January, 1878 (Vol. XI., No. 1.), they will permanently increase each number by *fifty additional pages*, thus giving its subscribers annually about ONE-THIRD MORE READING MATTER than heretofore, or, a volume of 896 large octavo pages with *no change in the subscription price*.

An increased number of illustrations, both wood engravings and lithographed plates, may also be expected in future volumes.

While the prosperity of the AMERICAN JOURNAL OF OBSTETRICS, and this consequent substantial evidence of it, cannot fail to be gratifying to all its subscribers and other friends, the Publishers trust the Medical Profession will take this voluntary action on their part as an earnest of their desire and intention, so far as in their power, to make all their publications merit the liberal support which is given them.

Subscription Price, $5.00 per year, invariably in advance.

☞ If any subscriber has a friend to whose notice he would like to commend the Journal, the Publishers will be pleased to mail a Specimen Copy to any address furnished them.

LESSONS IN

Physical Diagnosis.

THIRD EDITION. REVISED AND ENLARGED.

In one handsome octavo volume, cloth, $3.00.

NOTICES OF THE PRESS.

"The previous editions of this volume have been very well received, and, from their ready sale, appear to meet a well-recognized want. . . . We find the plan of the work excellent, and, within the limits proposed by the author, very well carried out. It would be easy to point out many omissions; completeness and conciseness to a certain degree exclude each other; but in the space assumed, it would be difficult to include a greater variety and amount of sound teaching. The style is compact, clear, positive, and exact. It is free from all irrelevant discussions; nothing is allowed to disturb or confuse the distinct image of clinical facts. . . . The book is very creditable to its acute and industrious author; and whoever shall practically master its contents cannot fail to be a discriminating and well-furnished diagnostician."—*The Medical Record.*

"For students it is the best work on physical diagnosis that is published."—*Detroit Review of Medicine.*

"This is a work already well and favorably known to the profession. In the present edition the original text has been entirely revised and enlarged by the addition of five new lessons."—*Chicago Medical Examiner.*

"Students of medicine and practitioners will find this just the work to meet their wants on the subjects of which it treats. Its instructions are full and very plain."—*Cincinnati Medical News.*

"The previous editions of the work, confined to an exposition of the subject of physical exploration of the chest and abdomen, we have regarded as among the very best works on the subject extant, and hence recommended 'Loomis on Physical Diagnosis' to our classes; and it gives us pleasure to repeat, in this form, our hearty commendation of the book."—*Mich. University Medical Journal.*

LECTURES ON

Diseases of the Respiratory Organs,

HEART AND KIDNEYS.

In one handsome octavo volume of over 550 pages. Price, in extra muslin, $5.00; *or, in leather,* $6.00.

NOTICES OF THE PRESS.

"It is clear in style, convential in arrangement, very definite and practical in its teachings."—*Philadelphia Medical Times.*

"We like the systematic method in which these lectures are arranged, and regard them as excellent in every way."—*Cincinnati Lancet and Observer.*

"By all means buy Loomis' work and *study* it."—*Ohio Medical and Surgical Reporter.*

"In the one before us the reader may look confidently for the last words on the subject, and may rest assured that what the author has here committed to the press is the result of much learning, sound judgment, and thorough experience."—*American Practitioner.*

"We have no hesitation in pronouncing it one of much value to the profession, and highly creditable to the author."—*New York Medical Journal.*

"While the views presented are fully up to what is actually known on the subjects treated, the doctrines are judicious and safe. At the same time they are presented with unusual clearness, and with sufficient positiveness to command confidence."—*New Orleans Medical and Surgical Journal.*

LECTURES ON

FEVERS.

In one handsome octavo volume. Cloth, $4.00; *Sheep,* $4.75.

NOTICES OF THE PRESS.

"We have before us, therefore, a book containing statements of practical facts relating to certain diseases, and the theories regarding their nature, mode of origin and propagation, and arranged so as to be easily comprehended by the medical student. We also believe they will be read without weariness by the daily practitioner. . . . It contains much practical knowledge, and cannot fail to be read by a very large proportion of the medical profession; for a concise statement of facts—with only such qualifications as can be safely indulged in without endangering perspicuity—is always acceptable."—*The Medical Record, Nov.* 24, 1877.

"This last work of Professor Loomis' is a valuable contribution to medical literature. His treatment of the subject is mainly practical, and is in strict conformity with what the author has himself observed at the bedside. The general management of fever is justly regarded of greater importance than the administration of drugs. It is a book that will well repay careful study."—*Western Lancet, January,* 1878.

"The work is clearly and concisely written, and will be useful and acceptable to both student and practitioner."—*N. Y. Medical Journal, March,* 1878.

"In this interesting volume, which contains the lectures [illegible] delivered by Professor Loomis to his class during the last ye[illegible] have a concise and impartial review of the literature concerning f[illegible] which has been published since 1850 with reference to a few [illegible] books, 'because they contain many of the so-called new theories [illegible] modes of treating fevers.' In this are embodied the results o[illegible] author's own extensive clinical experience, which has led him to [illegible] opinions in certain respects at variance with those of some [illegible] observers; and the weak points of theories and modes of practice [illegible] have not stood the test of time, are clearly set forth."—*Boston* [illegible] *and Surgical Journal, Dec.* 22, 1877.

Sent by mail, post-paid, on receipt of price.

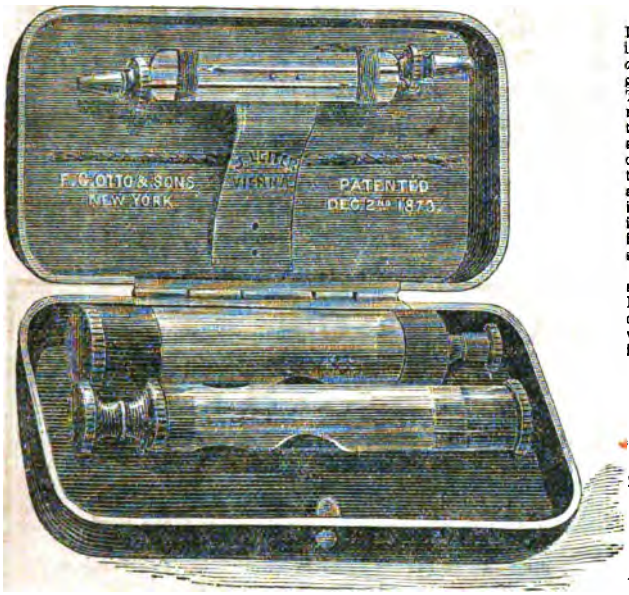
LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.



The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

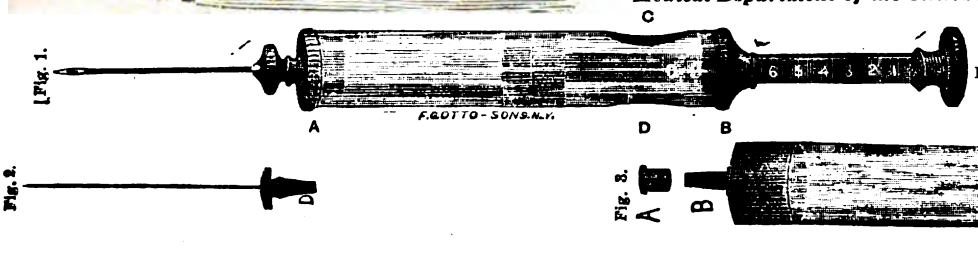
The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***



PRICES.

Glass Syringe in Plain Leather Case, 2 needles and vial.	$4 25
Glass Syringe in Morocco Case, 2 needles and vial	4 75

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

Prepared by CLIN & CO., Pharmacists, Paris.

LA PLATA EXTRACT OF MEAT.

CH. DELACRE,
Sole Consignee,
IXELLES, BELGIUM.

Agents for the U. S.,
E. FOUGERA & CO.,
NEW YORK.

This Extract is a pure extract of Beef, prepared according to the improved process of Baron von Liebig, unsurpassed in quality, free from fat and gelatine, each pound of which contains the soluble nutritive constituents of 34 to 36 pounds of the finest beef, exclusive of bones and fat, corresponding to about 45 pounds of good butcher's meat. As a medicinal agent it will be found of great value to the sick, invalid, and persons and children of weak constitutions. ***It will keep unaltered for years in any climate.***

CAUTION.—Physicians wishing to use a pure extract of beef will do well to specify the ***"La Plata,"*** since it is never offered for sale until it has been analysed by Mr.

CH. DELACRE, Chemist, General Consignee at Brussels,

and found by him to possess the essential qualities of the best articles of this kind.

None genuine without the above trade-mark—*Bullock reclining.*

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

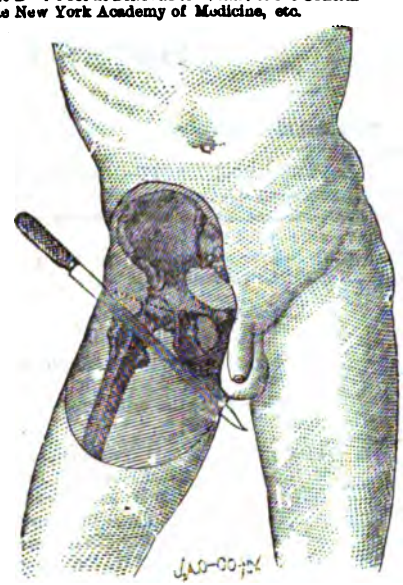
ON SURGERY

THE PRINCIPLES AND PRACTICE.

By FRANK HASTINGS HAMILTON, M.D., LL.D.,

Professor of the practice of Surgery with Operations, and of Clinical Surgery in Bellevue Hospital Medical College; Visiting Surgeon to Bellevue Hospital; Consulting Surgeon to the Bureau of Surgical and Medical Relief for the Out-Door Poor at Bellevue Hospital; to the Central Dispensary, and to the Hospital for the Ruptured and Crippled; Fellow of the New York Academy of Medicine, etc.

In one royal octavo volume of about 1,000 pages, illustrated by 467 Engravings on wood.
Price, in extra muslin, $7.00; or in leather, $8.00.



Anatomy of H Joint, and Guides for the Knife.

NOTICES OF THE PRESS.

"Has evidently been prepared with the greatest care, both on the part of the author and his publishers; and as a text-book for the students, it reflects the highest credit upon its well-known and gifted writer. As a text-book for the student, or one of reference for the busy practitioner, it undoubtedly is one of the best and *most modern* that has yet appeared."—*The Medical Record.*

"A valuable addition to our list of text-books, an excellent work of reference, a credit to our professional literature."—*New York Medical Journal.*

"It will be found an excellent and common-sense volume."—*London Medical Times and Gazette.*

"This is one of the best text-books upon Surgery which we have ever seen, and we recommend it highly to the profession."—*Chicago Medical Examiner.*

"Prof. Hamilton's latest work is one that will add to his already high reputation. . . . It is full of valuable practical suggestions, and directions."—*Am. Journal of Medical Science.*

"American in plan, scientific in method, written in clear, concise, classical English, Prof. Hamilton's Surgery is a noble legacy to the medical student, an honor to the profession, and an ornament to our native tongue."—*Detroit Review of Medicine.*

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, JR., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWIN L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion, may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatizing Cod-Liver Oil, the active digestive priciple of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Peptodyn, the New Digestive, is a combination of the whole of the digestive secretions—Pepsine, Pancreatine, Diastase, &c., forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition.

N.B.—*The success of this Remedy has led to several imitations of it*, which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

Tins, 1/-, 2/-, 5/-, 10/-

AS SUPPLIED TO

THE ROYAL NURSERIES

of England, Russia, Etc.,

AND CONTAINING THE

HIGHEST AMOUNT OF NOURISHMENT

IN THE

MOST DIGESTIBLE AND CONVENIENT FORM.

THE MOST PERFECT SUBSTITUTE FOR HEALTHY MOTHER'S MILK.

DATURA TATULA FOR ASTHMA, ETC.

A powerful and universally adopted Remedy.

"By immediate contact with the air cells and passages, instant relief is given."—Dr. LATHAM, *Physician to the Queen.*

"A remedy of great power and usefulness in Asthma, Chronic Bronchitis, &c."—Dr. W. BARKER.

"The smoke causes no nausea. I have never known an instance in which relief was not obtained."—GENERAL ALEXANDER.

In Tins, for use by means of a pipe, Cigars and Cigarettes, and Pastilles for Inhalation.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers. Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

Messrs. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely-chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

THE MANUFACTURERS,

KEASBEY & MATTISON,

332 N. Front Street, Philadelphia.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

SUPERIORITY OF

WARNER & CO.'S

SUGAR-COATED PHOSPHORUS PILLS.

(Twenty-Four Combinations.—See List.)

For EFFICACY, PERFECTION, and FREEDOM from harm, this make of Pills of Phosphorus is unrivalled. The process originated and perfected by W. R. WARNER & Co., for the administration of Phosphorus in pill form, diffuses the Phosphorus, in its elementary state, thoroughly through the mass in a state of solution, a result by no other process attainable. The value of Phosphorus as a remedial agent is impaired if the element is not exhibited in its free state, and protected from oxidation by a perfect and *non-porous coating of pure white sugar*. You are cautioned to avoid cheaper and inferior brands.

Messrs. WM. R. WARNER & Co., *Manufacturing Chemists, &c.*

GENTLEMEN:—The Phosphorus Pills* submitted to me for Chemical Analysis and Microscopic Examination afford only traces of Phosphoric Acid, and contain the one twenty-fifth of a grain (gr. 1-25) of the element in each Pill, as expressed upon the label; they do not exhibit particles of undivided Phosphorus, the mass being perfectly homogeneous in composition, soft in consistence, and thoroughly protected by the non-porous coating of sugar from the oxidizing influence of the air. Each Pill is an example of what skill, care, and elegant Pharmacy can do. I regard them as a marvel of perfection.

Very respectfully,

A. E. McLEAN, *Analytical Chemist and Microscopist,*
40 and 42 Broadway, N. Y.

Late of Gardner & Ainslie's Laboratory, Edinburgh, Scotland.

Original Communications.

IS THERE AN "AMERICAN METHOD" OF TREATING FRACTURES OF THE THIGH?

By W. H. VAN BUREN, M.D.,

PROFESSOR OF SURGERY, BELLEVUE HOSPITAL MEDICAL COLLEGE, CONSULTING SURGEON TO NEW YORK HOSPITAL, BELLEVUE HOSPITAL, ETC.

The above question is suggested by the selection of this term by one of our hospital surgeons—himself a high authority on the subject of fractures—for the "improved extension apparatus" exhibited by the late Dr. Gurdon Buck at the *Exposition Universelle* of Paris in 1867. This method of treatment was described by its projector, at that time, in the pages of the Record (March 15, 1867, p. 49), and has since been familiarly known to surgeons as "Buck's Extension." As several important improvements in the treatment of thigh fractures originally brought into effective use in America are not included in this apparatus, the propriety of adopting the proposed suggestion seems to me open to question. It seems very desirable, also, that what are clearly American improvements should be recognized and specified as such, if this be possible, before they are absorbed and appropriated beyond recall. As a contribution to this object, I offer the following facts and considerations.

Whilst seeking evidence as to the value of Lister's antiseptic dressing in the wards of Guy's Hospital, London, in the summer of 1876, Mr. Howse incidentally called my attention to some thigh cases under successful treatment by what he styled the "American method," and of which he spoke favorably. I found, on examination, that the apparatus was Prof. Hodgen's modification of the late Nathan R. Smith's anterior splint, slung from a pulley at the end of a pole which projected five or six feet from the foot of the bed at an angle of nearly 45°. The limb, below the fracture, was fixed to the foot-piece of the splint by means of lateral strips of adhesive plaster, and the extension, which (as a consequence of the position and remoteness of the point of suspension) was effected entirely by the weight of the limb, acted in the direction of the broken bone, whilst the weight of the patient's body was all-sufficient for counter-extension. There was no pulley or weight employed. This apparatus is pictured and highly praised by Mr. Bryant, at p. 403, vol. ii., of his "Manual of the Practice of Surgery," London, 1876, where he refers to a large number of excellent results obtained by it.

Subsequently, in a hospital in Holland, cases of fracture of the thigh were pointed out to me as under treatment by the "American method," and the title here was justified by the use of adhesive plaster in adapting the extending force (weight and pulley) to the limb.

In a paper by Le Gros and Th. Anger, "*Des tractions continues et de leur application en chirurgie*" (*Archives générales*, Jan., 1868), a case is related of a boy with an oblique simple fracture of the thigh, treated in Nélaton's service at the *Hôpital des Cliniques*, in April, 1866, by what the authors designate as the "*appareil Américain*." It is described as consisting of "a long splint, provided at its lower extremity with a screw, so arranged as to effect traction upon the lower portion of the broken limb by means of strips of adhesive plaster applied upon its surface." "The only modification of this apparatus made by us," say the authors of the article, "was to introduce some tubes of caoutchouc into the extending cord between the loops of plaster and the screw." The object of this article is to set forth the value of India-rubber, in surgical extension, as a source and equalizer of power, and its especial quality of rapidly tiring out muscular contractility. The late Dr. Suckley (U. S. Vols.), after serving at the New York Hospital as house-surgeon, made a visit to Paris in 1855, and took with him a specimen of the thigh apparatus in use at that time in the hospital, which he presented to Nélaton. It is this, no doubt, which is styled the "American apparatus" in the above quotation. But it is to be noted that "elastic rubber webbing" formed a feature in the "Buck's Improved Extension Apparatus" exhibited in Paris in 1867 (*v.* Record *ut supra*), and the above paper was not published until 1868. I have Buck's own authority for the fact that he borrowed the idea of elastic extension from Dr. H. G. Davis, of this city, who was using it in connection with weight and pulley extension in the treatment of joint diseases.

The important improvement of adapting the elastic tension of India-rubber as a source of power for surgical purposes, claimed by the French surgeons whose paper I have quoted, seems, in fact, to have originated with Davis, who states that "his principle" of "continuous elastic extension" was inaugurated in 1856. (*American Medical Monthly*, N. Y., May, 1856, p. 330.) Barwell, writing in October, 1861, says that the idea of using it for "artificial muscles" had occurred to him "about a year ago." (*Med. Chir. Trans.*, vol. xlv., p. 25.)

Dr. W. Stokes (in the *Dublin Medical Journal*, May 9, 1870) has a case in which the thigh, already twice fractured, was treated on this third occasion by the "American permanent extension splint." The New York Hospital apparatus of 1855 had been introduced in Dublin, in that year, by Dr. C. R. Agnew, who had recently completed his service as hospital surgeon.

Finally, Prof. Spence, of Edinburgh, reproduces a wood-cut from Erichsen of Buck's apparatus (as pictured in the pamphlet "taken from The Medical Record") in the last edition of his "Lectures on Surgery" (Edinburgh, 1875, vol. i., p. 345), but does not mention Buck's name, nor indicate in any way its American origin, confining himself to establishing its identity in principle with a "weight with circle and strap for hanging from the ankle," and a fracture-bed with a "horse-girth perineal band," which he also pictures, from Hildanus. Having in this manner disposed of the question of originality, Prof. Spence goes on to describe all the details of Buck's apparatus, with short splints, adhesive plaster strips, and weight and pulley extension, adding also the later device of lifting the foot of the bed, so as to do away with the perineal band for counter-extension—as he, Prof. Spence, says he has employed them. His only allusion to America is contained in the following quotation (from p. 346): "I prefer deep sand-bags, to prevent rolling of the limb outward in fractures of the thigh, to a long lateral splint, as used in America." He elsewhere speaks of this as "the simplest, least irksome, and most perfect method I know of treating fractures of the thigh" (p. 345), and uses the same or even higher terms of commendation in his address before the British Medical Association, at Manchester, in August, 1875 (*Med. Times and Gaz.*, August, 1875, p. 205), without, however, recognizing that the value of the improvements which give this method its superiority had been ori-

ginally demonstrated in the New York Hospital ten years before.

Even from this scanty show of facts, it seems fair to draw two inferences: first, that devices regarded (by most of those who employ them), as American in origin, and by all as improvements, have secured a foothold abroad; and, second, that the designation of "American method," or "apparatus," is already applied abroad to several distinct modes of treating fractures of the thigh—modes as different, in fact, as Hodgen's modification of Nathan R. Smith's anterior splint and the old long splint with screw extension in use at the New York Hospital in 1855. The term, therefore, is applied to certain recognized improvements which have come from our country, and not to any special method or apparatus.

These improvements are:

1. The use of adhesive plaster to connect the extending power with the limb. This is the most important of all these devices, as it does away with the great pain and the danger of eschar and ulceration which attended all the contrivances previously employed for this purpose. Buck first employed it in the New York Hospital, about 1852, and demonstrated on a large field of practice its entire efficiency. He ascribed the merit of originating it to Dr. Josiah Crosby, of Manchester, Vermont. But Dr. Crosby was probably anticipated, without his knowledge, by Dr. Wallace, of Philadelphia (*v.* review of *Sargent's Bandaging and Minor Surgery* in the *New Hampshire Jour. of Med.*, August, 1850, vol. i., p. 27), and there is also "a tradition of its use in this way by more than one generation of 'country doctors' in a remote corner of Pennsylvania" (*v.* Sargent's work, *ut supra*, Philadelphia, 1862, pp. 177–8), and Benjamin Gooch employed it in the last century to retain the foot and leg in position after rupture of the tendo Achillis, and in fracture of the patella. (*Chirurgical Works*, London, 1792, vol. iii., p. 130.) Buck certainly took a large part in popularizing the use of the adhesive plaster in treating thigh fracture, and it constituted the principal claim to superiority of the New York Hospital apparatus which was introduced abroad in 1855.

2. Next in importance is the device of elevating the foot of the bed, in order to secure the benefit of the weight of the patient's body as a counter-extending force. After a long period of trial, this measure has secured the confidence of practical surgeons, and the inestimable advantage of being able to give up that instrument of torture, the perineal band, is only now beginning to be universally recognized. Buck's original method did not include this device, but in a copy of his pamphlet of 1867 which he sent me in 1875, whilst considering the propriety of exhibiting a model of his apparatus at the Centennial Exhibition, in answer to my question as to what he considered essential features of his method, the following note is appended in his handwriting: "The counter-extending band has gone into disuse. Experience has shown that the weight of the body, aided by elevation of the foot of the bed, affords sufficient resistance to the extension in almost all cases. G. B." It was only after many years of patient trial that this conclusion was reached, for the original suggestion seems to have been derived from Dr. Van Ingen, of Schenectady, N. Y. (*v. Trans. Am. Med. Association*, vol. x., p. 436, New York, 1857—in an appendix to a *Report on deformities after fractures*, by F. H. Hamilton, M.D.). The foot of the bed is represented here in a woodcut as elevated from twelve to twenty inches, the patient's foot being attached firmly to its footboard. Erichsen, who praises the "American method"—applying this title to Buck's apparatus—in a clinical lecture in 1868 (*London Lancet*, May 9th), makes no mention of this device, nor yet of the use of the elastic element in extension. In his last edition (1878) Buck's picture is reproduced with the perineal band still in place. This picture is also copied by Spence. I will mention here that I learned from Dr. Buck, shortly before his death, that an army surgeon, who had employed this device with success, in connection with his (Buck's) extension apparatus, in the Lincoln Hospital, during the war, had since visited Edinburgh, and introduced the improvement there. He was unable to recall the surgeon's name.

3. The introduction of the *elastic element* in connection with the extending force ranks next in importance amongst the improvements in the treatment of thigh fractures which have originated in our country, and I doubt whether we even yet properly estimate the advantages which India-rubber offers in this direction to the surgeon. The gentle, but unyielding force exerted by this curious substance when put upon the stretch or when subjected to compression, has no rival as an antagonist to muscular contractility; it follows up without the slightest remission the successively contracting and relaxing fasciculi which make up the masses of muscular tissue in such a manner as to exhaust their contractile capacity, and tire out the muscle in less time and with less exertion of force than any other form of power. This quality, it may be remembered, was claimed for the weight and pulley, when this form of power replaced the screw. One of Nélaton's cases witnessed by an American student may be mentioned in illustration. Whilst lecturing one day at his Clinique, a new case of luxation at the shoulder was brought in. Nélaton seated the man so that his trunk was supported, called for a few feet of India-rubber tubing, which he doubled and attached by one end to the abducted humerus just above the elbow, stretching it slightly, passed the other end over a hook in the wall. He then resumed his lecture. In less than ten minutes the man exclaimed that his shoulder had gone into place. Bryant relates that in a neglected dislocation of the shoulder of twenty-five days' standing, Mr. Cook, of Guy's Hospital, placed a vulcanized India-rubber air-pad in the axilla, and bandaged the arm firmly to the chest. On the third day the head of the bone was found to have returned to its natural position. It is capable of demonstration that a much smaller weight is efficient in thigh extension by weight and pulley when transmitted through an elastic medium. India-rubber is employed in connection with several forms of thigh splint in the London hospitals as an "accumulator" of the extending force. Mr. Erichsen mentions in his last edition an "elastic catch," recently devised by one of his house-surgeons. A force so gently continuous, and yet so powerful, cannot fail to meet many wants of the surgeon; and, as far as I can learn, it was first used in our country.

4. The weight and pulley is a form of power which has been long used in surgery. It claims notice here in consequence of its revival in this country in a new and more efficient combination, which has been demonstrated to possess merit enough to displace the screw. It has been employed in the treatment of fractures of the thigh, in this country, by Dugas, and, as early as 1819, by Daniell; and in Europe, as Malgaigne tells us, by Seutin, Guy de Chanliac, and Fabricius Hildanus in the sixteenth century. Like the short splints, with which Buck has proved that good results can be procured with diminished pain and constraint to the patient, the weight and pulley con-

stitute a part of his apparatus—the form of power which his large experience led him to prefer.

5. The "anterior splint" is justly entitled to the designation of an "American method." I see it stated recently (in the *North Carolina Med. Journ.*, Jan., 1878, p. 45) that in our "Southern States, the home of the invention, the weight and pulley extension is less employed than the suspensory anterior splint of Prof. Nathan R. Smith." In the language of Prof. Hodgen, of St. Louis, who is the best known exponent of its merits, "to Nathan R. Smith, of Baltimore, is due, I believe, the credit of indicating the best principle for the management of fractures of the thigh—by suspending the limb, semi-flexed, from some remote point, and allowing the weight of the limb, with the obliquity of the suspending cord, to accomplish the required extension" (*St. Louis Med. Jour.*, vol. viii., N. S., May 10, 1871); and it does effect the necessary degree of extension, without any pulley and weight, or any additional force beside the weight of the limb, the weight of the patient's body affording all sufficient counter-extension without any perineal band whatever, or any tilting of the foot of the bed. Prof. Hodgen, who has improved the apparatus in many important details, demonstrated these facts during the late war, and they are confirmed by the success of his improved splint at Guy's Hospital, London, at the Marine Hospital, Greenwich, England (*v. Guy's Gazette*, December 11, 1875, and Bryant, *ut supra*), and by Dr. Hewson, of the Pennsylvania Hospital, who is said to give it the preference (*Medical News and Library*, Phil., Feb., 1877, p. 26).

Prof. Hodgen expresses his surprise that this method has not been more generally adopted by surgeons. Is it because its merits are not generally understood? In the woodcut in Erichsen's last edition the point of suspension is figured immediately above the patient's knee, *i. e.*, in a vertical direction; whereas, to secure the power of extension which the apparatus possesses, it should be located in an oblique direction, *i. e.*, at a "remote point"—over the patient's ankle, or at the end of a pole as at Guy's—although a study of the parallelogram of forces will show the latter to be too remote to be advantageous.

If we apply the term "American" to Buck's "improved extension," what designation will remain for the Smith-Hodgen method?—or for the outcome of these several American improvements, viz., the great gain of being able to command a good result in thigh fractures *without a perineal band*, which (with the adequate and painless extension afforded by either Buck's or the Smith-Hodgen apparatus) will be recognized by the practical surgeon, hereafter, as the most important of them all?

I am forced to the conclusion that we should continue to use for Buck's "improved extension apparatus" the designation which he originally gave it—with his name prefixed in grateful recognition of a lifetime of patient, practical investigation, through which we are the gainers; and, also, as a means of distinguishing it from the eminently American method of Smith and Hodgen, in which, besides other advantages, extension and counter-extension are secured by a most ingenious and, as far as I know, a most original device.

NEW YORK MEDICAL REGISTER.—Dr. W. T. White has been elected, by the New York Medico-Historical Society, editor of the New York *Medical Register*, vice Dr. A. E. M. Purdy, resigned.

CLINICAL OBSERVATIONS ON THE EARLY STAGES OF SCARLET FEVER, WITH SUGGESTIONS AS TO PATHOLOGY.

BY C. E. BILLINGTON, M.D.,

VISITING PHYSICIAN TO DEMILT DISPENSARY, N. Y.

(Read before the New York Academy of Medicine, March 7, 1878.)

PART II.

THE phenomena of the stage of invasion, then, are: primarily, angina, which is specific and probably peculiarly irritating in character; secondarily in order of time, and possibly also in that of causation, varying degrees of nerve-disturbance and fever.

The duration of this stage, as is well known, varies greatly. Such observations as I have made upon this point would tend to fix its average at about eighteen hours.

THE STAGE OF ERUPTION.

The disease, which has hitherto been simple in the sense of presenting but one manifest lesion, the angina, now becomes complicated by the addition of a second—the well-known eruption—a hyperæmia with exudation; in other words, an inflammation of a mild type of the more superficial cutaneous structures.* With its appearance occur characteristic changes in the mucous membrane of the tongue, and perhaps of other mucous surfaces.

The view which has been frequently advanced, that the angina and the rash are simply parts of a contemporaneous or continuous eruptive process of all the cutaneous and mucous surfaces, is perhaps not fully supported by facts. They are in typical cases neither contemporaneous nor continuous, but, as has been seen, are separated by a distinct and not inconsiderable interval. Prof. Thomas, in the article from which I have already quoted, says: "There is found in scarlatina no constant or characteristic condition of the mucous membrane of the organs of digestion, as was found to be true also of that of the air-passages. The mucous membrane of the stomach and intestines, in cases which have been most carefully and microscopically examined, has been found perfectly normal, or only affected with some incidental lesion. A permanent hyperæmia of the mucous membrane does not denote, as was formerly erroneously thought, an exanthem of the mucous membrane, but denotes in severe cases, as in other acute exanthemata, the presence of a catarrh."

That the eruption may be a sequel in order of causation, as it is a sequence in order of time, of the angina, cannot, I think, be pronounced impossible. When we see urticaria produced in some persons by the irritation caused by eating a single strawberry, erythema a not infrequent attendant on various inflammatory affections, and eczema and other eruptions often produced or aggravated in children by the irritation of each advancing tooth, can we deny that a specific and peculiar nerve-irritation may have the constant effect of producing a specific eruption? But when we further consider that this specific angina may, as has already been suggested, have its specific morbid and morbific products, which may be absorbed into and distributed by the blood, we have an-

* That the eruption does not depend upon the agency of the sweat-glands or perspiratory ducts, as was suggested in the discussion by Dr. Andrew H. Smith, seems conclusively shown by a case, reported in Ziemssen's Cyclopædia, of its occurrence over a large cicatricial surface where the skin had been entirely destroyed by a burn.

other mode of causation by which it and the eruption may be connected.

While the remarkable irregularities in time and manner of the appearance of the eruption are suggestive of the former of these modes of origin, its probable agency in the contagion of the disease and its inoculability as strongly favor the latter.

There is in some cases at this stage the pulse of arterial tension, which condition may, as was pointed out by Dr. Broadbent, be due either to a toxæmic or a neurotic cause.

Whatever may be its etiology, the eruption becomes a new and not unimportant source of nerve-irritation and febrile excitement. No wonder that these phenomena, if marked before, now become greatly intensified, and that in many cases they now for the first time assume prominence.

In estimating the disturbing effect of the eruption upon the general economy, its interference with the normal functions of the skin must also, of course, be remembered.

MALIGNANT SCARLATINA.

But it may be objected that this theory of primary peripheral nerve-irritation fails to furnish an adequate explanation of that intense fever and those appalling nerve-disturbances that early characterize malignant cases, for the reason that the angina is not always seen in such cases to be severe. Indeed, statements of its occasional supposed absence in such instances are not wanting, and may be adduced in opposition to the foregoing argument.

To these I reply: First, that the throat-affection has not always been very carefully studied in this disease, even by some who are otherwise excellent observers. I have in several instances been told by physicians who were intelligent and had seen not a little of scarlatina, that the angina in a given case was slight, but, on going with them to it, have been able to convince them by ocular demonstration, on a second observation, of their error. In malignant cases the urgent general symptoms often divert attention from the throat. I know by experience how easily a physician who is called at night to a child in convulsions or delirium or coma, and who inspects the throat of his struggling patient hastily and by an imperfect light, may be led into error by failing to see all that is actually there.

Having been personally searching with especial attention for several years, and in a large number of cases of all grades of severity, for one in which angina was absent, but in vain, I will be greatly obliged to any one who will show me such an instance.

Second, while it is true that the appearances of throat-inflammation are in some malignant cases at first comparatively slight, it is yet probable that the primary local irritation is in all such instances peculiarly intense. That this is not always objectively evident, may be explained by the fact that the perturbation of nerve-functions may actually retard the natural *local* reactions to that primary irritation. Pain, redness, and swelling may therefore be developed more tardily and imperfectly than in a milder case where this irritation is really less intense. But while this partial retardation may continue for a day or two, the reaction does come if the patient lives longer. Meigs and Pepper say: "We have found that, in all severe or grave cases in which the patient did not die with violent nervous symptoms under the first shock of the scarlatinous poison, there has been developed a severe and dangerous anginose inflammation about the third or fourth day." As the general truth of this statement is not likely to be disputed, the question that remains is—must this "*first* shock of scarlatinous poison" be regarded as necessarily toxæmic and central, or may it not be peripheric, and due to the intense local irritation which was really the first stage of this "severe and dangerous anginose inflammation"? The barriers of the resistance of the nervous system being once broken down by this peculiar irritation in especially susceptible organizations, the various morbid processes that constitute or result from fever follow with unchecked rapidity.

Again,* if the primary cause of disease in malignant cases is a poison—organic or chemical—received into the blood in the lungs, how can it be explained that so many who constantly inhale the same poison escape constitutional infection? And how can it be explained that the disease is not about equally fatal in all who have been equally and continuously exposed to the same contagion?

Further, the fact of the usual non-recurrence of the disease in those who have had it seems to find a more rational explanation, either in the hypothesis of a special tissue-change, or in that of a change in nervous susceptibility to a given disturbing impression, than in that of a permanent alteration in the constituents of that perpetually renewed fluid, the blood. Can we suppose that a special permanent blood-change is produced by each of the non-recurring diseases?

Now, it has been shown in this paper that continuous exposure to the contagion of severe scarlatina has probably the nearly constant effect of producing a characteristic faucial redness, but that fifty per cent. of eighty-six unprotected children continuously exposed escaped the disease, though most of them showed this faucial redness. Are not these two facts, taken in connection with the third one, that angina is the earliest and the most important symptom of the disease, very suggestive of the conclusion that this angina may be primary; † and that, whether primary or secondary, it is yet the real commencement and the chief efficient cause of the subsequent and accompanying constitutional malady?

The fact that the disease proceeds no farther than this initial stage in so many instances, and the various other irregularities that are so eminently characteristic of it, find their most rational explanation in that apparent capriciousness in nervous reactions with which we are familiar in numerous practical illustrations.

If urethral fever may be regarded as belonging to the class of reflex disorders, as was suggested by Dr. Horatio C. Wood in his interesting monograph, "A Study of the Nature and Mechanism of Fever," and further by Dr. Thomas R. Brown, in the article "On Urethral Fever," in the *New York Medical Journal*, February, 1878, an additional analogical argument is

* These considerations were in part urged by Dr. B. W. Richardson against the germ-theory of disease (vide *Medical Press and Circular*, October 10, 1877, p. 293), but seem to me to have even greater force against any hypothesis based on a primary general blood-change from an inhaled specific chemical poison, as the laws of chemical action are known to be uniform.

† With regard to a question referred to elsewhere in this paper, and also in its discussion as having an obvious bearing upon this point, Dr. Lefferts informs me that erythematous pharyngitis occurs in most—probably in all—cases of secondary syphilis concomitantly with the cutaneous eruptions; but that data are wanting for a definite answer to the question whether it is, as a rule, the earliest of the secondary manifestations. The corresponding facts as to small-pox communicated by inoculation are, so far as I have been able to learn, equally unattainable; but in that disease, when taken in the ordinary way, there is, in some cases at least, an angina which precedes the eruption by two days. In measles, irritation and congestion of the pituitary, pharyngeal, and bronchial mucous membrane precede the eruption by three days. That there is a close analogy in the modes of inception of the three acute exanthemata can hardly be doubted.

furnished, in connection with facts which have now been presented, in favor of the possibility of this being the essential nature of the early constitutional disturbances in scarlatina.

I have thus endeavored to sketch the salient points in the clinical history of scarlatina from its inception, through the stage of invasion to the beginning of that of eruption, with some suggestions as to possible relations of cause and effect that seemed to me neither far-fetched nor violently improbable. I shall follow it in detail no farther. The disease now becomes rapidly in severe cases more and more complex. There now occur in such cases other well-known organic lesions. There is now unquestionably important blood-change; but this is not, so far as has ever been positively demonstrated, specific, but such as is perhaps common to some other febrile diseases. It is probably not the primal cause of the disease, but its effect.

That this blood-change occurs in malignant cases with an earliness corresponding to the rapidity of other processes, and may contribute not a little to their severity, cannot be doubted; but this by no means proves that, even in such cases, it is initial or primarily causative.

FEVER-HEAT.

An appreciable phenomenon in all cases of scarlatina, and one of supreme importance in many, is *fever*. Any exhaustive discussion as to how far this may be, on the one hand, merely "irritative" or "symptomatic," or, on the other, "hæmic," would be far beyond the scope of this paper. It may be primarily the former, but later, in the course of changes such as have just been pointed out, partake of both characters.

I have, however, taken the temperatures daily in many cases, with observations upon the relations of those temperatures to the inception, extension, intensification, or the opposite, of local inflammations.

The result of these observations has been to show a general correspondence between the two.

It may in the first place be remarked that the typical thermometrical curve in a normal case of scarlatina may generally be observed to represent the rise and the decline of the faucial and the cutaneous inflammations.

When, however, the line of thermometrical elevation is irregular, its sudden rise may usually be observed, at least in cases of moderate severity, to denote intensification of the angina, its extension into the nasal or Eustachian passages, the involvement of lymphatic glands, or the occurrence of other local inflammatory complications or sequelæ.

The following are examples of many that might be cited:

I.—John G——, age seven, Jan. 18th, second day. Temperatures on successive days: 101°, 102½°, 103°, 102½°, 102½°, 100½°, 100½°. Took cold, with aggravation of throat-affection: 102½°, 102°, 101°, 100°, 100°, 99½°, 99½°, 98½°.

II.—Ida P——, age three, Jan. 18th, first day: 99½°, 99½°, 101°, 102½°, 103°; follicular tonsillitis: 104°, 103°, 102°, 102°, 102°, 101½°; otitis and adenitis: 103½°, 103°, 102½°, 102°, 102°, 101¼°, 101°, 100°, 100°, 99½°, 99½°, 98½°.

III.—John McG——, age four, Jan. 7th, first day: 100¼°, with slight sore throat. On fourth day, with follicular tonsillitis and pain in right ear, 103½°; fifth, 102¾°; sixth, discharge from ear, 100¾°; seventh, pain in left ear, 102¾; eighth and ninth, the same; on tenth, discharge from left ear, 100½°. The angina and double otitis peristed for twenty days more, with temperature ranging between 99½° and 102°, the upward variations being repeatedly directly traceable to their aggravation from taking cold or neglect of treatment.

IV.—Nelly Q——, age six, Feb. 14th, second day: 104½°; severe angina, 105°, 103°; stomatitis, 104°, 102½°, 101°, 101°, 100°, 100°; increased tonsillitis, 100¾°, 100°, 99½°, 99½°; increased tonsillitis, 101°, 99½°, 99°, 98½°.

Similar variations in temperature in connection with other complications might be illustrated, but it is unnecessary.

These observations, again, are corroborated by those of Dr. Bullard.

PROGNOSIS AND TREATMENT.

My remarks under this head must be exceedingly brief and general.

The dangers to be considered in the early stages of scarlatina are twofold, those resulting from the angina and those depending upon the fever and nerve-disturbance; for, intimately as these are connected, they may be, and often must be, estimated and combated separately. The prognosis is grave in proportion to the severity of either.

The importance of measures intended to mitigate the discomfort and disinfect the morbid secretions due to the former, has long been generally recognized. In addition to agreeable cool drinks, I generally prescribe small and frequent doses of chlorate of potash with a little glycerine in lime-water, which is a pleasant mixture. Under this treatment the early vomiting very rarely proves persistent or troublesome. When indicated, I combine with this mixture the bromide of potassium or the spirit of nitrous ether, or substitute for the lime-water in it the spirit of Mindererus.

In severe anginose cases, or those attended with diphtheritic complication, I employ the same treatment that I use in diphtheria.

The angina of scarlatina is probably never cut short by treatment, but in a certain proportion of cases it may be somewhat mitigated, glandular implication and septic absorption prevented and diphtheritic complication cured, and thus a fatal termination averted.

High fever-heat has in my experience been an invariable characteristic of malignant cases. The constant tendency of such cases to a speedily fatal issue, and the fact that some have been saved by the prompt employment of vigorous antipyretic measures, are well known, and the resulting indication generally recognized. Cool bathing, and quinine in *large* doses, are the remedies to be employed. Owing to the exceptional ignorance and prejudices of the families in which malignant cases have occurred, in my dispensary service, I have not ventured to employ any other form of bath than cool sponging, and in one instance a partial use of the wet pack. While these have been followed by no successful result, the uniformity with which a slight reduction of temperature by these means has been attended with a temporary subsidence of the most violent nerve-symptoms, has been striking.

Except with definite antipyretic indications and in antipyretic doses, quinine has not seemed to me to be useful in the earlier stages of scarlatina.

Inunctions I esteem less than I did formerly. The claim that they prevent itching and discomfort of the skin has not seemed to be well founded, these symptoms having been particularly troublesome in some cases in which they were employed. Tepid sponging is of unquestionable value.

The results in the 102 cases referred to have been as follows: Three passed under the care of other physicians, leaving 99 to be accounted for. Of these, 85 recovered and 14 died. The variableness of the rates

of mortality, and the consequent difficulty of estimating the results of treatment in scarlatina, are well known. A larger proportion than usual of these cases have been grave—fully one-third of those that recovered having been of severe anginose type, and not a few attended with nasal, diphtheritic, or other serious complications. Good nursing also, which is of especial importance in this disease, has been deplorably lacking in many instances. These results, therefore, though not at first view brilliant, have been in reality, all things considered, decidedly favorable.

A majority of these cases have been visited daily, and some oftener, temperatures taken and other observations made, and the treatment carefully attended to. While I am indebted to various other gentlemen for valuable assistance, I am under especial obligations to Drs. A. E. Prince and O. B. Douglas.

Reports of Hospitals.

HOSPITAL OF UNIVERSITY OF PENNSYLVANIA.

CLINICAL LECTURE ON CARUNCLE OF THE FEMALE URETHRA.

By WILLIAM GOODELL, M.D.,

PROFESSOR OF GYNÆCOLOGY IN THE UNIVERSITY OF PENNSYLVANIA.

(Reported for THE MEDICAL RECORD.)

THE most common and painful affection of the female urethra is caruncle. The patient that I bring before you to-day is thirty years of age and married. Young as she is you see how the disease has left its marks upon her, how emaciated, careworn, and cachectic-looking she is. From her appearance one would really suppose that she was suffering from some severe and wasting constitutional vice. Her history is very brief, but very sad. Three years ago, when in the midst of most excellent health, she found that her urine began to scald her when she made water. The passage of the last few drops gave her the most agonizing pain. This pain grew daily more severe and unbearable, until of late she holds her water as long as possible, and when at last she is obliged to pass it, she clutches any chair or article of furniture that stands in reach, so great is the agony. The pain about the meatus did not at first interfere with the approaches of her husband, but the time came when cohabitation was pure torture to her, and of late she has been obliged to give up all marital intercourse. Very naturally this abstinence has become a constant source of domestic unhappiness. Within the past year or so even walking has grown to be a painful exercise. You see she walks with a sort of stoop, at the same time holding her legs as far apart as she can. She has suffered a great deal lately from burning sensations in the external organs of generation. There is an abundant leucorrhœal flow. Her urine is streaked with blood, and her linen stained by the same fluid. She has become very much distressed and very melancholy from constant brooding upon her condition. Several physicians who have hitherto attended the patient have been misled by the symptoms presented into supposing her to be the victim of some chronic uterine affection. Let me warn you how easy it is to be led off the track in just such cases as this one, and how careful you ought to be to make a thorough examination of the urethra before settling upon the presence of any other disease. The patient tells me that applications have been made to the cervix, and that vaginal suppositories and pessaries have been constantly employed, without giving her the least relief; and no wonder. As I myself have made this same blunder I will not be uncharitable.

I am going to examine the patient thoroughly before you. I separate the woman's thighs and bring to view the meatus urinarius. This little crimson, highly injected, wart-shaped body is what we know as a caruncle. Some call it vascular tumor, and some vascular excrescence of the urethra. We will not, however, disturb ourselves about names. Suffice it to say that this tiny, insignificant-looking growth can, and does give rise to the most exquisite pain even when touched with a feather. The little nervelets which are distributed over its surface reach, in time, a most exaggerated condition of hyperæsthesia. Even now when the patient is thoroughly under the influence of the ether you see how she winces when I seize the caruncle with this pair of toothed forceps and bring it fully into view. Now that you get a good view of it, you notice, no doubt, the resemblance it bears to an Antwerp raspberry. See how exceedingly vascular it is! I have been holding it and pulling it out of the urethra with the most gentle traction, and yet see how the blood oozes from its walls! I told you a minute ago that the woman winced when I touched the growth, though she was fully under the anæsthetic. I should say to you in explanation of this that a woman's external genitals are the last parts of her body to be affected by the ether. Sensation is so very acute in these parts that it will remain unblunted long after the nerves of the periphery have succumbed. You have a very good illustration of this fact when your hand or instrument comes in contact with the near approaches to the vagina in a case of vaginismus. The patient may be in the most complete stage of ether narcosis, and yet the minute you try to introduce your hand, or a speculum into the vagina she begins to struggle with you, and you are forced to stop your manipulations and give more ether.

This is a very severe case of caruncle. The growth has been left so long unremoved, and has been so much irritated that it has begun to affect seriously the patient's health. You will very rarely come across cases presenting so many symptoms as the present one. Usually the general health is not at all affected, and the woman will only complain of pain and *malaise* during the acts of coition and micturition. On the other hand, I have seen much worse cases than this one—cases in which the constant pain and restlessness and wear-and-tear of the system had brought on temporary insanity. I can give you a very good case in point. Some years ago I saw, in consultation, a young married lady, who had been utterly broken down in body and mind by her acute sufferings. She had dysmenorrhœa very badly, coitus had not been possible for months, her temper was becoming ruined, and she was fast falling into a state of confirmed hypochondriacism. Her lips were blanched, her eyes hollow and sunken, and her whole face unutterably melancholy and wasted. I never once dreamed that all these symptoms grew out of the simple presence of a urethral caruncle. I examined the poor girl's lungs, auscultated her heart and arteries, examined the cervix carefully by sound and speculum, and thought that I had reached the root of all the evil when I came upon a slightly anteflexed womb and reduced it. I was getting frightfully perplexed and bewildered, when a glance into the opening of the urethra showed

me the true state of affairs. When I cut out the caruncle she was all right again as if by magic.

Caruncles are more common, I think, in married women than in virgins. They do not generally appear until after the prime of life. This case is an exception to that rule. Various causes have been assigned for their appearance. I am rather inclined to refer them to the congestion of the urethral plexus of veins by the pressure of a gravid or displaced womb. In some cases an over-distended bladder or rectum will bring about congestion. Thus a caruncle owes its growth to the same predisposing and exciting causes as does an hemorrhoid. I have heard of instances in which they had been produced by uncleanly habits, or a constant and irritating leucorrhœal discharge. Some authorities speak of gonorrhœa as an exciting cause.

Caruncles are hypertrophied urethral papillæ which are covered with the usual pavement epithelium, and become gradually over-supplied with blood and nervous attachments. Caruncles may be single or multiple, sessile or stalked, pink or scarlet, and are usually found at the mouth of the meatus, and at its lower verge. I have seen them, however, stud the whole rim of the opening, and occasionally have known them to extend up the canal for the distance of a half an inch or so. They vary in size from that of a pin's head up to that of a pigeon's egg; usually they are not larger than a good-sized raspberry. This one is very small, and yet see how much harm it has done! There is, therefore, no proportion between the amount of pain produced and the size of the tumor. The more vascular and vivid the caruncle, the more sensitive is it. This caruncle, as you can see for yourselves, has a broad base of attachment just within the verge of the meatus. Do not confound with a caruncle the pale, non-vascular, but highly sensitive neuromatous tumors of the urethra mentioned by some writers. These I have never met with, though I have, upon several occasions, removed from unmarried girls a worm-like tumor which dangled from the vestibule. These tumors were pale, but not at all sensitive.

There is a great deal of real difficulty connected with the diagnosis of caruncles of the urethra. Vaginitis, displacements of the uterus, diseases of the ovaries, all give rise to vesical disturbances; and if the symptoms are not quite so complete as they are in this case, you will be very likely to overlook the caruncle. Reflex uterine symptoms draw away your attention, while delicacy prevents you from making an ocular examination of the parts. It is a very great art to be able to examine the urethral opening of a woman without offending her proper and instinctive sense of decency. I once made a very bad blunder of this sort myself; but, as I have learned a great deal from experience since then, I feel myself to be in a position to advise you in this matter. A patient comes into your office, we will say, with some affection such as that which we are now considering, where it is exceedingly advisable that you should thoroughly examine the parts not only with fingers and instruments, but with your eyes. Do not ask the woman to lie down on your table or lounge, tell her that you want to *see* what is the matter, and then brusquely proceed to do so. Let me assure you that very few respectable women will submit to that sort of treatment, particularly at the hands of young doctors. Never suggest to a woman the necessity for an ocular inspection of her person, but do it without her consent.

Let us suppose that the case is one in which dysuria is a prominent symptom. You will very naturally infer the existence of some uterine lesion, and will, of course, make an examination with the speculum, to which most women will submit. While exploring the uterus with the index-finger, you may, at the same time, with the thumb press upon the meatus, and notice whether the pressure gives pain. During the introduction of the speculum, you can always visually inspect the parts without the knowledge of the woman. Now, in my experience, whenever you can confidently say to the patient, "I have found out the cause of your distress; here it is;" and can at the same time, by pressure with your finger upon the caruncle, prove what you say, she will offer no resistance to any future needful exposure. Never, however, forget to go through with the formality of covering your patient with a sheet.

The prognosis of caruncle depends largely upon the nature of the tumor. The probability of cure is excellent when the caruncle is stalked. When it is sessile, or multiple, it is no easy task to get rid of it. For every sessile tumor you snip off, two fresh ones are likely to take its place. However, there are methods of restraining the growth of these tumors, as I will soon show you.

How are you to remove a caruncle? If it has a distinct stalk, one clip of the scissors does all the work. How are you to act when the caruncle is sessile? The case I have to-day is one in point. I place the woman in the lithotomy position, fronting a good light. She must be thoroughly under the influence of the anæsthetic. While the assistants support the knees and stretch open the meatus, I seize the growth and carefully remove it by repeated snips of the scissors. Be sure to include with the growth a portion of the healthy mucous membrane on each side. After cutting out the caruncle, I have hitherto been in the habit of quickly drying the raw surface, searing it with the frayed end of a match moistened with fuming nitric acid, and then with a little olive oil decomposing any excess of acid.

To-day I am going to scarify the wound with the *Cautère-Paquelin*. This instrument is very highly prized as a thermo-cautery abroad, and has of late been imported by our instrument-makers. This cautery usually stops all bleeding at once. Nitric acid is not nearly so reliable in its styptic action. Four years ago I had been called to operate upon a case, and had removed for the second time a sessile caruncle, when, upon my second visit, about twelve hours after the operation, I found that the woman had lost, and was still losing, a large amount of blood. I applied first ice, and then Monsel's salt to the raw surface, and put on a compress and a T-bandage. In spite of these precautions, at my next visit, six hours later, I found the hemorrhage still going on. I applied the lunar caustic, and then tried to nip the bleeding point with a *serre-fine*, but the part was too tender for further interference, and the patient would not take an anæsthetic. What was I to do? The prospect of spending an hour or two at the patient's bedside, with my finger pressing on the urethra through the vagina, was not altogether desirable. Suddenly the thought struck me, why not let a sponge do the work of my finger? So I straightway inserted a sponge half way into the opening of the vulva. Its elasticity, and that of the perineum on which it rested, made the needful pressure upon the bleeding surface. The Paquelin instrument does away with the possibility of such a complication. If you have not this instrument, use a red-hot knitting-needle.

The after-treatment of the patient will consist in the application, twice a week, of the undiluted commercial

carbolic acid until the wound has healed. Carbolic acid dressing will very often prevent the development of a crop of small growths around the stump of the parent stem. Occasionally you may have to repeat the cutting operation. In one obstinate case, which had resisted repeated operations, I gained a cure by first cutting off the growth, and then forcibly dilating the urethral canal with the expanded blades of a dressing forceps until it admitted my index-finger. By stretching the muscular coat of the urethra, I released the involved plexus of veins from its spasmodic contraction, and thus relieved their congestion. In some very obstinate cases it may be necessary to excise the growth, and bring the sides of the raw surface together with stitches. In this way the site of the caruncle is covered with healthy tissues, and the chances of its return are greatly diminished.

Suppose the woman will not let you use the knife—what are you to do then? Whittle the end of a match to a point, and with it touch each growth twice a week with the crystals of carbolic acid made fluid by heat. This operation is painless, and will very effectually mummify the caruncle and blunt its sensitiveness. After the use of this local anæsthetic, you can very often nip off the growth without the patient's feeling it. An English gynæcologist of distinction advises chromic instead of carbolic acid. Chromic acid must be applied with more care than the carbolic acid, and should afterwards be neutralized in its action by means of pledgets of lint dipped in a strong solution of carbonate of sodium.

Progress of Medical Science.

Spontaneous Gangrene in the Course of Typhoid Fever. — Twenty years ago, M. Bourgeois (d'Etampes) reported to the *Société médicale des hôpitaux* a case of spontaneous gangrene in the course of typhoid fever. M. Béhier, appointed to make a report on this communication, denied the causal relation between the fever and the gangrene. Since that time, however, a number of cases have occurred, proving M. Bourgeois correct. M. Lerebouillet has collected seven or eight examples, to which he has added two new ones; one observed by M. Mercier, at the military hospital, Saint Martin; the other observed by himself in his own service, at Val-de-Grâce. The first was the case of a young soldier, twenty-one years of age, who entered the hospital May 29, 1877, presenting all the symptoms of typhoid fever, from which he had been suffering ten days. During the next few days the temperature had risen so high as to call for the cold bath. About the twenty-second day, attention was called to the heart, of which the patient complained, but neither murmur nor palpitation were found. The patient also complained of pains in the right leg, more severe during the night. The foot was examined, and a commencing gangrene discovered, which involved the entire foot, and extended a short distance up the leg. This presented all the characteristics of a dry gangrene, and had already existed two or three days. Pulsation had ceased in the arteries of the limb, the femoral was empty of blood, and there was evidence of the existence of clots in the vessels. In three days the gangrene involved the leg and thigh, the left foot was attacked in its turn, and the patient soon died.

At the autopsy, the lesions of typhoid fever were found; in addition, an old clot was found in the abdominal aorta, opposite the articulation of the second and third lumbar vertebræ, occluding the vessel and extending into the crural artery of the right side; the arteries of the leg were empty. The examination of the heart gave no evidence of myocarditis, but revealed a pretty extensive endocarditis, occupying the entire internal surface of the left ventricle. The left auricle was filled with old and large clots. In a word, in the abdominal aorta, in the iliac, and in the femoral, there were very large clots, which the author reported as embolic.

The second case, observed by M. Lerebouillet himself, occurred in a young man, twenty-two years of age, who entered Val-de-Grâce August 21st, with typhoid fever, on the fifth or sixth day of the disease. The fever was of moderate intensity. The heart was not affected, with the exception of a slight feebleness of the first sound. The fourth day after his admission, the patient complained of pain on the superior and external surface of the right leg; there was at this point some puffiness. In a short time the whole foot was the seat of a gangrene, presenting all the characters of senile gangrene. The crural artery was empty of blood, and there was neither pulsation nor bruit. The pulsations on the left side were very feeble.

On the 19th of September the patient's condition was very grave, and he was transferred to the surgical service, where the leg was amputated. Only a few drops of blood escaped, although the arteries were all open, and no precautions were taken to prevent hemorrhage. The autopsy of the amputated limb showed that the arteries had entirely disappeared in the mortified parts. The patient recovered and the wound had cicatrized in fifteen days, but pulsation had not returned in the right femoral. It is probable that in this case a clot was formed in the external iliac, from which a secondary clot lodged in the anterior tibial, occluding that vessel. What was the origin of the formation of these clots, is a question which cannot be satisfactorily answered, since no autopsy was obtained. There probably was in this case an arteritis of some large arterial trunk. However, these two cases show undeniably the possibility of the coincidence of typhoid fever and dry gangrene. The explanation of this coincidence is yet to be given.—*Gazette des Hôpitaux*, Jan. 3, 1878.

A New Method of Practising the Aural Air Douche. — Dr. Gruber recommends the following modification of Politzer's method of introducing air into the tympanic cavity. By this plan, the sipping of water, often so objectionable, is dispensed with. The closure of the pharynx affected by the swallowing of water, may be brought about equally well by pressing the tongue against the hinder part of the palate, if a strong expiration be made at the same time. This result is obtained when the consonants "h," "c," "k," are sounded together in the most sudden manner. By the addition of a vowel we have a complete syllable: thus, "hack," "heck," "hick," "hock," "huck." On uttering these in the succession in which they are written, the tongue is found to be pushed further backwards and more firmly upwards with each succeeding syllable, making the closure of the pharynx more and more effectual. The maximum effect is produced, when the combination of consonants "hck" is uttered without the vowel. If at the moment this is uttered, air be also forced into the nostril, from Politzer's bag, it will readily find its way into the Eustachian tube. By inclining the patient's head strongly to one side, and introducing the nozzle of the syringe into the nostril corresponding to

the ear to be injected, the chances of success are increased, and it was noted that the air entered more freely the upturned ear. The advantages claimed for this method over that of Politzer are:

1. It is simpler. The sipping of water, which is often objectionable, is no longer necessary.

2. The pharynx can be maintained in the position assumed in uttering the prescribed syllable, and air be made to enter the tubes for a longer time than is possible with the brief act of swallowing.

3. By varying the syllables, the force with which the air is made to enter the tubes can be varied.

4. This method is especially adapted for self-treatment, because the patient learns by his own sensations to regulate the force with which the current is sent into the ears.—*The Lancet*, Jan. 12, 1878.

Contributions to the Study of Cerebral Localization.—The following two cases were observed by M. Hardy, at la Charité. One shows complete coma following disease of the sphenoidal lobe, one of the so called "mute centres" of the brain; the other lends support to the position of Fritsch and Hitzig, who place the motor centres for the extremities in the gray matter of the anterior ascending convolution. The first, a case of phthisis, gave no evidence of any alteration in motion or sensation until within a few days before death, when he passed into a comatose state, in which he died. This coma was supposed to be due to a serous effusion, but the autopsy revealed only a commencing softening of the central portion of the sphenoidal lobe, one of those portions of the brain to which no functions, either of motion or sensation have been attributed, and which have on this account been called the "mute centres." The second was also a case of phthisis, but there was here a marked paresis of the right arm and some embarrassment of speech, without, however, any affection of the intelligence. These symptoms gradually increased, both in intensity and extent, and the patient soon passed into a state of coma and died. The autopsy revealed a meningo-encephalitis at the central portion of the parietal lobe.—*Gazette des Hôpitaux*, December 9, 1877.

Extirpation of the Larynx.—The report of the case from which Dr. Foulis removed the larynx has already been carried forward to the thirteenth day after the operation. Four months later, the patient had returned home with a good voice and in improved general health. As soon as the wound was in condition, an attempt was made to introduce Gussenbauer's voice-tube, but owing to the shape and small size of the tube, and the undue contraction of the upper portion of the wound, the result was unsatisfactory. Dilatation of the contracted part, by means of the finger, was now actively pushed, and in the meanwhile a tube was made, after very considerable difficulty, to fit the wound. This tube was a modification of Gussenbauer's, but only in shape, and in the position of the reed, the principle of the two being identical. During ordinary breathing no sound is emitted from the tube, but in forced expiration the reed is set in motion, and the sound thus produced is modulated into vowels and consonants by the mouth. So perfectly does this work that, were it not for the monotony of the note, it would be impossible to distinguish anything extraordinary in the voice. By changing the reed the timbre of the voice, as well as the note, can be changed, and the patient amuses himself by making reeds of different materials, as wood, ivory, vulcanite, the metals, etc.; in this way he has at command a large assortment of voices to be chosen from at will. This seems to prove that the quality of the human voice depends more upon the density and elasticity of the vocal cords than upon the size and shape of the buccal cavity, though further experiments tend to show that this latter has some modifying effect. It is essential that the instrument should fit accurately, and this, at first, gave much difficulty, more especially the determining of the proper length of the ascending tube. If this be too long, the epiglottis closes imperfectly, reflex action is excited in the pharynx, and the increased secretions flow through the tube into the trachea, giving rise to troublesome and continued coughing; if too short, the soft parts fold over and partially close the mouth of the tube, causing a muffling of the voice, similar to the effect produced by swollen tonsils or any other swelling which encroaches on the pharynx, while the glottis remains healthy.

There is as yet no sign of the recurrence of the growth for which the larynx was removed, and the two glands, which before the operation were large and dangerous-looking, are now very small, but may still be felt on careful examination. The patient is still rather subject to colds, and during convalescence had a sharp attack of bronchitis, which for a time gave some anxiety, but he recovered well from this, and the lungs are apparently as sound as at the beginning of treatment.—*The Lancet*, January 26, 1878.

Dermoid Cysts.—At the meeting of the Pathological Society of London, Mr. Wagstaffe showed three specimens of dermoid cysts growing along the lines of branchial fissures. One was removed from the inner angle of the orbit, and two others from the outer angle of the orbit, all being situated beneath the orbicularis palpebrarum, and adherent to the bone; in the first case along the junction of the lachrymal and frontal bones, in the two latter of the fronto-malar suture. Verneuil has advanced the theory that dermoid cysts of the face and neck always occur along the line of the branchial and other embryonic fissures, and are connected with them, and Mr. Wagstaffe brought forward these cases especially to elicit opinion on this point. He mentioned three cases where this was certainly not the case; one described by Mr. Arnott, situated over the suture, between the two halves of the frontal bone, another found on the torcular Herophili. Of twenty-five cases of dermoid cysts in peculiar situations, Mr. Wagstaffe found that twenty occurred along the line of the first branchial fissure. These cysts are distinguished by their depth and their attachment to the bone. Mr. Hulke said that these cysts were easily distinguished from similar growths by their depth and attachments; the bone beneath them was usually dimpled and occasionally perforated. From these cysts occurring so frequently in other situations than the branchial fissures—as the ovary and the mediastinum—he felt it difficult to accept M. Verneuil's theory. Sublingual cysts are sebaceous rather than dermoid; they never contain hair. Mr. Doran said that the cysts so common at the outer angle of the orbit lay out of the line of the clefts dividing the visceral arches, and in front of the frontal and malar bones, which are found in the membrane late when the fissures are being obliterated. On the other hand an adhesion of the epiblast and mesoblast, such as occurs in the formation of the oral cavity of the amphyoxus, may produce a complicated tissue, from which these cysts spring. Mr. Bryant had seen a large number of these cases. Except at the outer angle of the orbit, there is no special site at which they occur; and he could not accept Verneuil's theory without additional evidence.—*The Lancet*, Jan. 26, 1778.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, March 30, 1878.

THE OUT-PATIENT DEPARTMENT OF THE NEW YORK HOSPITAL AND THE ABUSE OF MEDICAL CHARITY.

It is well known that there are gross abuses of medical charity connected with our various dispensaries; that patients who are able to pay not infrequently receive advice gratis; that very little if any pains is taken by many specialists connected with these institutions to sift the paupers from the pretenders, and that colleges and hospitals make open bids for clinical material, and no questions are asked as regards money. All this is reprehensible, but can be looked upon even with complacency, when compared with the cool and calculating method of cheating the poor doctor out of his legitimate fees, as practised by the management of the out-patient department of the New York Hospital. It is well known that the Board of Managers of this institution openly advertise to furnish advice for the sum of one dollar per month to all patients who may apply. Of course, this offer is perfectly proper for those who cannot afford to pay any more; but when there is no intention of making any distinction, as far as these services are concerned, between the rich and the poor, the case assumes quite a different aspect.

Although, from the first, there has been a deep and wide-spread indignation against this system, strange to say very little has been openly said against it. The attending staff connected with the institution has not protested against it, and the out-door staff has worked quietly and contentedly without a murmur, and, as far as we know to the contrary, without a cent of pay. The matter has been brought up before the County Society, and the course of the managers of the hospital has been denounced; but notwithstanding months have elapsed, no further progress has been made than the appointment of a committee to report upon the subject. As an exception to this rule of apparent indifference to the points at issue, the East River Medical Association boldly presented the following protest to the Board of Governors:

"New York, Nov. 17, 1877.

"*To the Governors of the N. Y. Hospital.*

"Gentlemen:—The out-patient department of the New York Hospital, by furnishing medical services for a merely nominal fee to patients who are well able to pay the fee ordinarily charged by physicians in private practice, is greatly injuring us and the profession generally by drawing away some of our patients, and making it almost impossible to collect our usual fees from others.

"In view of these facts, the East River Medical Association respectfully asks you to discontinue the practice of undercharging such patients."

In due time the following reply was received:

"New York, Jan. 2, 1878.

"Henry E. Crampton, M.D., *Corr. Sec. East River Med. Association.*

"Sir:—Your communication dated Dec. 7th, accompanying a memorial to the Board of Governors from your Association, asking modifications in the rules governing the out-patient department of the hospital, was laid before the Board at their regular meeting held this day.

"I am directed to inform you that after due consideration the memorial was laid upon the table.

"Respectfully your obedient servant,

"D. Colden Murray, *Secretary.*"

It would appear from the foregoing that the Board of Governors not only tacitly acknowledge the truth of the statements contained in the protest, but decline to take any action regarding it. The appeal was eminently a respectful one, and the answer was as courteously explicit. Possibly the Association has been properly snubbed for its impertinence in interfering with the management of affairs that does not concern it. But regarding this point there is room for much honest difference of opinion. The profession at large take considerable interest in the side-issues of this question, and there must come a time when its influence will be properly felt in the desired direction of bringing about necessary reforms. In the meanwhile the report from the committee of the County Society is in order.

CHURCH HYGIENE.

Although the subject of ventilation of public buildings is always in order, and has from time to time been discussed in its different bearings, it is strange that little, if anything, has been said regarding the necessity of supplying purer air to our churches. Probably one of the best reasons for this is that these edifices are occupied only for short periods, and on that account there does not seem to be much grounds for complaint or much actual necessity for hygienic reforms. Under such circumstances, when the congregations are relatively small, and when but one or two services are held daily, not much harm is done. When the contrary is the case, however, the mischief is almost incalculable. This, for instance, is the rule in the Roman Catholic churches, which not only have crowded con-

gregations, but which congregations quickly replace each other in the earlier masses without any other ventilation than that afforded by the opening of the doors. Hence it often happens that for four hours continuously the atmosphere of the church is breathed by as many different congregations without an inside change of air. The priests who officiate rarely appreciate this condition of things, inasmuch as with each service they quickly succeed each other, and are besides apparently oblivious to all other duties save those which pertain to their strictly clerical offices. It is strange, when it is so easy to obviate them, that these evils should be allowed to exist. A thorough ventilation between services is a remedy which so readily suggests itself, that it seems almost unnecessary to refer to it. The extra time required for this purpose, say ten minutes, is so small a sacrifice in comparison with the benefits to be obtained that it is not worthy of consideration. Another point connected with church-going invites a remark here, and that is the greater danger of propagation of contagious diseases in an atmosphere saturated with the exhalations of thousands of worshippers. The readiest and most efficient diluent of contagion is fresh air. It occurs to us to say also that a much more effectual way of preventing the spread of such diseases is to insist that all persons liable to carry the germs of contagion should remain away. It is melancholy to think how much the dissemination of some of the diseases at present prevailing has been, during the Lenten season, due to a neglect of these simple precautions.

PUBLIC ANALYST BILLS AND PREVENTIVE LEGISLATION IN GENERAL.

In a recent editorial the *Philadelphia Medical Times* discussed the Public Analyst Bill now before the Legislature of the State of Pennsylvania, and the general question of food adulteration, in a manner evincing thorough information as to the facts of the subject. This, however, would naturally be expected of the editor, Dr. Horatio C. Wood, who is one of our foremost authorities in toxicology. But he, in our opinion, gives space to the recital of familiar facts which should, particularly in a journal circulating mainly among members of the profession, be given to the discussion of remedial measures. The statistics, data, and methods of food, drink, and drug adulteration have been so often descanted upon that one wastes words in stopping to demonstrate the public necessity for legal remedies against frauds of this class, many of them innocuous certainly, but a larger number in one way or another unwholesome and detrimental. The abuse has extended of late years even to the use of toxicological agents in dyeing the flannels and merinos employed in the manufacture of underclothing and hosiery, so that a bill having for its purpose the prevention of such fraudulent practices would need to be very large and general in its scope, and very minute and exact in its specifications. It may be somewhat doubtful whether an action would stand against a tradesman for obtaining money under false pretences, who sells fatty matter, derived from the dripping-pan, as butter, or dispenses tea adulterated with turmeric and graphite. Under the common law practice, in which wrongs were classified as against persons or against property, such prosecutions were possible without special enactment; judicial interpretation under that practice having for its basis the idea that law is a science of administering justice, not a mere set of rules specifying offences and leaving the wronged no redress against equally flagrant offences not provided for in the Code. Perhaps a general enactment defining in what an act of adulteration shall consist, and making it a misdemeanor to sell or offer for sale any article of consumption thus tampered with, would be more efficient than any of the cumbersome special enactments agitated by persons who have given more attention to the abuses themselves than to the best method of preventing them. Bureaus of inspection have uniformly failed in this country, whatever may be claimed for their efficiency abroad. For reasons that need not be specified here, since the fact is the point important to our purpose, it is simply an argument from experience to predict that a Bureau of Adulteration, with a hundred inspectors at good salaries, would fail to produce any significant results in this city. There would be a great flourish of trumpets to commence with, a few prosecutions would be initiated for the purpose of creating a popular impression of efficiency, and then the local inspectors and the dealers in their several districts would settle into an excellent understanding with each other. Such has been the experience with similar bureaus heretofore, and there is no reason to believe that a Bureau of Adulteration would prove an exception to the rule.

There are evidently two things required to prevent the adulterations in articles of popular consumption from which so large a proportion of the profits of trade are derived. The one is a law of the simplest and most intelligible description, defining what adulteration is, and what shall be its penalties upon first, second, and third convictions. The second is a method of procedure that will enable the average consumer to prosecute with the least possible inconvenience and expense. For this purpose, such a law should provide for the appointment of competent analyzers in every city and town in the State, who shall examine and report in writing upon any article of food, drink, or medicine submitted to them, at prescribed rates, the fees to form an item in the court and criminal expenditures of such town or city. Such written report, with the affidavit of the buyer of the package, should constitute sufficient reason for issuing a warrant of arrest, and holding the grocer, druggist, milkman, or vender of whatsoever designation for trial. Such a

method of procedure, properly guarded, would secure the co-operation of the consumer in enforcing the law, and that is the main point to be aimed at in a practical and efficient administration of preventive measures.

OUR PUBLIC PARKS.

THE recent attempts to appropriate a portion of one of our public parks for the building of an armory has met with well-merited opposition from many influential quarters, and the bill before the Legislature asking for the right of such disposal of property has been virtually defeated by a recent vote. It is pleasing to know that the Academy of Medicine was not behindhand in adding its powerful influence to the general opposition, and by the report of its committee was able to declare so emphatically in favor of breathing-places for our crowded population. It is, perhaps, well that the subject has thus been brought so prominently before the public, inasmuch as the sentiment which a discussion of its merits will create will have an influence beyond the mere defeat of the bill, and will prepare the way for many necessary reforms in park management.

In the way of possible improvements in our public parks, we may refer in passing to the proposition recently made by a distinguished physician of this city to convert these resorts into garden schools for our children, where object-lessons upon the most comprehensive scale can be learned, and the widest scope given both to the education of the mind and the body. It seems strange, at this late day, and with all the improvements of the nineteenth century at our doors, that we are preparing ourselves to learn anew the lessons taught us by the heathen philosophers. There is no doubt if our parks could be utilized for the purposes intimated, that we could make a great advance in the direction of a higher and more useful education, not only for our children, but for the public at large. Nor does the consummation of the idea seem so far off. In the Central Park, for instance, much of the material is already at hand, requiring only some system to make it available for such purposes. But whether this can or cannot be done, it seems quite certain that the parks themselves are to be secured to us, and that the public is not willing to deliver them to the mercy of political jobbers.

MEDICAL EXAMINATIONS FOR THE ARMY.

THE Army Medical Examining Board is now in session in this city, prepared to examine candidates for vacancies in the Medical Corps. There is no good reason why there should not be a large number of applications. To young men especially, an entrance in the army affords a fine opportunity, for the first few years, of earning a decent competency, and of preparing the way for a successful career in civil practice The pay is sixteen hundred dollars per annum, with fuel and quarters, with an increase every five years, and a retiring or sick pension when the time arrives. These are advantages in a pecuniary sense which cannot be approached during the first years of civil practice, and which should be taken into account by one whose necessities compel him to earn a living at once. Candidates must be between the ages of twenty and twenty-one years, citizens of the United States, in perfect health, present and prospective, graduates in medicine, of good morals, respectable family, and careful breeding. They must also be thoroughly educated in the branches taught in the common schools, extra qualifications in this direction weighing proportately strong in his favor. There are now fifteen vacancies in the corps, and there are enough good men and true who should fill them at once. The address of the Board is 1193 Broadway, N. Y. At the end of the examinations we propose to give the names of the successful candidates, with those of the medical colleges from which they graduated.

HOSPITAL PLANS AND SPECIFICATIONS.

CIRCULAR No. 10, War Department, gives a series of specifications and elevations for the erection of post hospitals, capable of accommodating from ten to thirty patients, which may be regarded as embodying the experience for many years of army surgeons in such matters. The circular is not noted here for the purpose either of describing the structures in use at military stations or of criticising them; but rather as suggesting what may be accomplished in the way of efficient hospital work at a very moderate expenditure. The question, how to take care of the indigent sick, is one that has presented itself to physicians in every village and small town in this country, as a question calling for some practical action; and here, with trifling modifications, perhaps, in external appearance, are supplied a series of hospital models, which can be carried out with such a trifling expenditure, that no town, village, or small city need be without facilities for the care of pauper patients. The tendency to build pretentious buildings, instead of making comfortable and adequate provision, at a moderate cost, is one that pervades the whole theory of medical treatment in this country. It is not alone in our insane asylums, but in hospitals of every class, that the mania for expenditure and show has been permitted to overbalance considerations of efficiency in the application of funds to the purpose for which they have been appropriated or subscribed. This War Department pamphlet reads a lesson on hospital arrangements to the whole profession.

THE PHARMACOPŒIA OF ITALY.—There is no pharmacopœia for Italy.

Reports of Societies.

NEW YORK PATHOLOGICAL SOCIETY.

Stated Meeting February 27, 1878.

DR. J. C. PETERS, PRESIDENT. IN THE CHAIR.

(Concluded from page 237.)

TUMOR À MYÉLOPLAXES OF THE UPPER JAW.

DR. LEWIS A. STIMSON presented a tumor of the upper jaw. The patient, a married woman, 40 years of age and of healthy antecedents, was admitted to the Presbyterian Hospital, Feb. 13, 1878. Eleven weeks previously she noticed a small lump on the gum below the left side of the nose; at that time she had only two teeth, the second molar and eye-tooth, and the stump of the first molar on the left half of the upper jaw. The tumor grew rapidly and was at times the seat of gnawing pain. Eight weeks after its appearance she had the eye-tooth drawn; this was followed by a severe hemorrhage lasting for an hour, and by moderate bleeding for about twenty hours more, and since then moderate bleeding has occurred frequently.

When admitted to the hospital she presented on examination a swelling above the margin of the left upper lip, which obliterated the normal depression corresponding to the canine fossa, and depressed the left angle of the mouth. On raising the lip a dark-red tumor was disclosed, extending along the left upper jaw from the median line to the stump of the first molar. Its form was globular, its surface smooth; its antero-posterior diameter measured one and one-half inches, about two-thirds of it lying outside the line of the teeth. Its upper border was on a line with the top of the ala nasi, and was interposed between the gingivo-labial fold and the bone. The surface of the tumor was covered with mucous membrane, showing on the outer side numerous tortuous and dilated vessels and one or two small abrasions; on the inner side the fibro-mucosa of the hard palate appeared to be unaltered. The line of the teeth was marked by a sulcus. The tumor was firm and elastic, did not crackle, and could not be reduced by pressure, and was painful only at its upper border. No enlarged glands could be felt either behind or below the inferior maxilla.

It was removed by an operation February 19th. A vertical incision was made through the skin, beginning at the side of the nose and passing downward around the ala and through the lip in the median line. The ala was separated from the bony margin of the nostril, the flap dissected outward over the top of the tumor to the malar process of the superior maxilla, the bone cut through with saw and pliers in the median line, a cut made with the pliers across the anterior wall of the antrum from the nasal fossa, and another cut made downward from the extremity of the latter to the second molar tooth. The portion of bone thus circumscribed was bent upward, cracking the palatal process, the mucous membrane of the hard palate was divided with the knife along the line of fracture, and the piece removed. The hemorrhage from the cutaneous incision and the under surface of the flap was very free. The posterior palatine artery was tied, and the bleeding from a small artery on the wall of the antrum, which could not be twisted, was arrested by means of the thermo-cautery. All other bleeding points were secured by torsion, the flap replaced, and its edges united by sutures.

Primary union was obtained throughout the entire extent of the cutaneous incision, and the inner wound is granulating nicely.

On examination of the piece it will be seen that, with the exception of a small piece of the floor of the antrum and of the nasal fossa, and the socket of the first molar, the portion removed is composed solely of the tumor. Vertical section of the tumor shows that the corresponding part of the alveolar process and body of the bone has been entirely absorbed as far up as to the floor of the nasal fossa and of the antrum. The surface of section is dark red, dry, with a few white fibrous bands crossing it vertically. The inferior surface of thin plate of bone limiting it above is rough and irregular, and intimately adherent to the tumor. The mucous membrane of the gum and hard palate shows as a white layer on the inner side, about 1 mm. thick; on the outer side it is much thinner, and has even disappeared entirely in places.

Microscopical examination shows the growth to be composed of fibrous tissue fully formed in some places, containing numerous vessels, a great number of myéloplaxes or giant cells, and some medullocelles. The existence of these two forms of cells is worth mention because it was never found by Prof. Robin, the discoverer of myéloplaxes.

The tumor, then, is an intra-osseous epulis (in the broader sense of the term) originating in the bone rather than in the periosteum, of the kind known as *myeloid tumors*, and of the variety *myéloplaxoma* or *tumeur à myéloplaxes*, in view of the preponderance of these elements.

These tumors, while not common, are still not rare; and their diagnosis, either before or after removal, is of great importance in view of their benign character, which is in such striking contrast to their malignant appearance. Here is a tumor of rapid growth, very vascular, occupying and absorbing bone, occurring in a patient forty years old, and at a point where a complete, or, *a fortiori*, a second removal might be very difficult and could be accomplished only at the expense of a serious mutilation. Its diagnosis, therefore, is of the utmost importance both as regards treatment and prognosis; and while all tumors *à myéloplaxes* cannot be positively recognized before removal, yet a strong presumption can often be established. The elements of the diagnosis in this case were, in the order of their value: the dark red or deep vinous color of the growth, its location in the spongy portion of the bone, the hemorrhages, the absence of glandular enlargement, of cachexia, and of pain. The color persists after removal, and is also found on the surface of section; it is not due solely to the pressure of blood or of its crystallized elements, but also to the reddish color of the myéloplaxes themselves, as may be seen under the microscope.

The position of the growth may be considered the natural result of the normal position of the myéloplaxes, for they are found especially in cancellous tissue and in the medullary canal, although also along the sides of the Haversian canals as far as to the periosteum. In the upper jaw the most common situation of the tumor is in that portion of the bone where the cancellous tissue is mainly found, and especially at the inner limit of the canine fossa. The process of development seems to be analogous to that of rarefying osteitis, the bone being absorbed as the new tissue increases.

The absence of glandular enlargement and of cachexia in this case corresponds to what I have found recorded in other cases, and also to the natural history of the affection, which is a purely local and not a diathetic one.

The age of this patient is above the average, which, according to the statistics of forty-nine of these tumors occupying different parts of the body, observed or collected by Eugene Nélaton, lies between the ages of twenty and thirty years. The same statistics indicate that generalization is never met with, and that local return is rare, and due, whenever it occurs, to incomplete removal, as by gouging or scraping with the fingers.

The operative indication to be drawn from these characteristics is that it is necessary only to remove the tumor and those parts that are immediately continuous with it. It is unnecessary to go farther and remove the entire bone. Free hemorrhage may be expected during the operation. Finally, if the microscope confirms the diagnosis, the patient may be assured that the tumor was not a malignant one, and that its return is not to be expected.

ROUND-CELL SARCOMA OF THE CALF OF THE LEG.

DR. STIMSON next presented a tumor occupying the calf of the leg. The patient, a German, widowed, thirty-seven years old, and of healthy antecedents, was admitted to the Presbyterian Hospital, February 11, 1878. In January, 1876, patient had a tumor removed from the right gluteal region, by Prof. A. C. Post, after two unsuccessful removals by another surgeon. The wound healed promptly, and the scar shows no sign of a return of the affection. The tumor was said to be a sarcoma.

In November, 1877, patient noticed a lump on the inner side of the left leg, just behind the middle of the posterior border of the tibia. It was at first painful, especially at night, and grew rapidly.

At the time of her admission to the hospital she presented a globular tumor in the calf of the left leg, as large as the fist; the circumference of the limb at that point measured 38 centimetres, that of the other limb 28 centimetres. The skin covering it was normal in color, thickness, and temperature, and not adherent; the tumor was regular, hard, elastic, not fluctuating, and movable, but the mobility could be greatly diminished by making the sural muscles tense. The tendo Achillis could be traced directly up to it and seemed to enter it posteriorly.

The glands in the groin could be felt distinctly, but were not very hard or enlarged. The abdominal viscera seemed normal. The right cavity of the thorax had been the seat of an acute pleuritic effusion, which was drawn off about three months ago. Dulness was found on that side, at the time of her admission, extending up to the fourth intercostal space, together with other signs of a reaccumulation of liquid.

Patient walked with great difficulty, and said the muscles of the calf felt stretched, and that sometimes the heel could not be brought to the ground.

Feb. 16th the patient was anesthetized and an Esmarch band applied. I cut down upon the tumor, and found that it lay between the soleus and the deep flexors; that it was closely adherent in front and behind both to the muscles and to the bone, and that it was very soft and friable. After consultation with the other surgeons of the hospital, I amputated immediately through the condyles of the femur, making a long anterior flap, and cutting the posterior segment of the limb almost straight across.

The amputation was performed under the spray, and the wound treated antiseptically; to-day, eleven days since the operation, the drainage tubes are out, and the wound is almost entirely healed.

The tumor is ovoid, 4 inches long, 2¼ thick, 3¼ wide; its surface, where it can be exposed, is regular, the color reddish gray, the consistency soft and friable. It has pressed the body of the soleus to the outer side, and distended its inner portion until it is not more than one-eighth of an inch thick; above, below, and on the outer side it cannot be separated from the muscle. It is closely adherent to the fascia along the line where the latter is inserted into the posterior inner border of the tibia, and through it to the periosteum. This union is so firm that the base of implantation is immovable. On the other side are seen a group of lobular prominences extending along and intimately adherent to the sheath of the posterior tibial artery. The nerve is not involved.

On section the tumor appears to be composed of two distinct portions: a central one, one inch in diameter, white and very soft; a peripheral one, reddish and very vascular, containing some large arteries and large veins.

Microscopical examination shows the tumor to be composed of small round cells closely packed together, with a granular, intercellular substance in places. Some of the cells show a distinct cell-body; some have two nuclei; others show no cell-body; some look exactly like leucocytes with sarcodic expansions.

MORBUS COXARIUS.

DR. SAYRE presented the upper extremity of the femur, which made the seventieth specimen of exsection which he had presented to the Society. He remarked that it was a very good specimen to show the propriety of the operation. The patient from whom the specimen was removed was a boy aged seven years. Two years and nine months ago he had measles, followed by scarlet fever, and then mumps. From all of these he appeared to have recovered. Soon after he fell upon his hip, causing an inflammation in the neighborhood, and in due time an abscess. The latter was duly opened by Dr. Peugnet. From that time the disease continued, and the boy was confined to his bed for over two years. When Dr. S. saw him the limb was shortened three inches, adducted and flexed strongly across the opposite thigh. There were sinuses upon the inner and outer aspect of the thigh, the discharges from which had very much reduced the patient. On consultation with Drs. Smith and Sabine, it was concluded that the child could be benefited by an operation. The latter was accordingly done. The head and neck of the femur were entirely gone, and a portion of dead bone was firmly encased in an involucrum exceedingly hard and one-eighth of an inch in thickness. Up to the time of reporting the case the child was doing well.

A CASE OF DOUBTFUL ABORTION.

DR. FINNELL exhibited a fœtus of six months' growth, which had been expelled by induced abortion. The mother, a single woman, came to this city for the purpose of having an abortion produced. She applied to a person who, from all accounts, performed the service, and the child was duly born dead. The abortionist denied the charge, and the question rested upon the significance of an ecchymosis of the left shoulder and left upper extremity—whether such a condition was a sufficient proof of violence having been used. It is proper to state, in this connection, that the case was one of arm-presentation.

None of the members were willing to commit themselves to an opinion upon these points.

The Secretary then presented a specimen for a candidate.

After which the Society went into Executive Session.

NEW YORK ACADEMY OF MEDICINE.

Stated Meeting, March 7, 1878.

DR. S. S. PURPLE, PRESIDENT, IN THE CHAIR.

CLINICAL OBSERVATIONS ON THE EARLY STAGES OF SCARLATINA, WITH SUGGESTIONS AS TO PATHOLOGY.

DR. C. E. BILLINGTON read a paper upon the above subject (vid. pp. 221 et 243). It being before the Academy for discussion,

DR. FORDYCE BARKER remarked that he fully accepted the clinical facts set forth in the paper, but was inclined to raise a question regarding the deductions which had been made from those facts. He was quite sure the writer of the paper did not expect that the conclusions which he had reached would be accepted without the most careful investigation. He was not prepared, however, to say that those conclusions were erroneous, but believed that the writer would be best complimented by examining the method of reasoning by which his conclusions had been reached.

First, with regard to incubation. It had often seemed to Dr. Barker that the term incubation, as ordinarily employed, had two significations: the one being the length of time which a poison could be retained anywhere and still retain its vitality; and the other being the length of time during which the poison might be deposited in the system, and remain latent before the first characteristic phenomenon of the disease manifested itself. In our loose way of speaking and writing, the term incubation was used to cover both of these points. He believed there was abundant evidence to prove that the poison of scarlet fever could be preserved in houses, in clothing, etc., for weeks, months, and for more than a year, and finally develop its full effects in a human system which was in a favorable condition.

The history of a case was then related, in which a woman in the puerperal condition was attacked with scarlet fever, and there had been no exposure to the poison, save that which came from wearing a wrapper that had been packed in a trunk for several months, and which, just previous to its packing, had been worn while taking care of a child sick with the same disease. This was one of many cases that could be related, illustrating the long period of time which the poison could be retained in clothing, and remain capable of producing its full effects.

Next, as to the length of time the poison remained in the system before it acted upon the individual. There were some cases which seemed to demonstrate that the poison could manifest itself within twenty-four hours after exposure. In other cases the poison seemed to be inactive for a much longer period of time. The length of time that elapsed seemed to depend upon the peculiar condition present in the system into which it was received and developed.

There probably was no question regarding the statement concerning the specific nature of scarlet fever, but it had seemed to be the aim of the author of the paper to demonstrate that the primary effect of the poison was produced on the mucous surfaces of the throat; that the same influence often extended to other persons not sufficiently susceptible to allow of its development, hence they escaped the disease. Dr. Barker was not prepared to say that such was not the case, but to his mind there were to the theory several important objections, which must be answered satisfactorily before it could be accepted. In the first place, the author assumed that there was no evidence that the poison of scarlet fever produced blood-changes as a *primary* effect. Was that true? Were not all the phenomena of the disease due essentially to blood-changes? No, said the author; and claimed that many phenomena of the disease, such as nausea, vomiting, cerebral disturbance, etc., were secondary to the throat symptoms. Dr. Barker found great difficulty in fully accepting that theory. There was a class of cases, of which he had seen a few illustrations, where the system was so rapidly overwhelmed with the poison, that life was destroyed within a few hours, and before the development of but few of the characteristic phenomena of the disease. Several illustrative cases were reported. The question was asked: "What was it that destroyed life in those cases?" The answer which Dr. Barker had given was, that death resulted in consequence of paralysis of the vaso-motor system of nerves produced by the overwhelming effect of the scarlet-fever poison.

Another suggestion made by Dr. Barker related to the influence which diphtheria might have had upon the series of observations made by Dr. Billington. In the year 1858 a fatal epidemic of diphtheria prevailed in the city of New York, and since that time the disease had had a continuous existence among us. Might not the epidemic influence of diphtheria, existing as a complication, account partly for the appearance of the throat in Dr. Billington's series of cases.

DR. GARRISH referred to several cases which seemed to show that the poison of scarlet fever could remain in rooms for a long period of time and yet retain its activity, and also that the disease could be conveyed in clothing.

DR. POST believed that in the class of cases in which the onset of the disease was severe, there was no relation between the severity of the symptoms and the accompanying sore-throat; in the protracted cases, however, there was usually an agreement between the general and the anginal symptoms. He also believed it to be necessary for the medical man to exercise certain precautions in order to avoid conveying the disease from one family to another. Careful ablution and airing should be secured after visiting patients sick with scarlet fever before visits were made in families exempt from the disease. It was also regarded as important to disinfect the hair of nurses and those in constant attendance upon patients sick with scarlet fever, for if that precaution was not taken it might be the medium through which the disease was conveyed, as had been shown by cases.

DR. J. C. PETERS believed in the local origin of the disease; that the system was affected through the throat and the blood even more rapidly than Dr. Billington was willing to admit. The history of a case was related, in which the throat symptoms were distinct, although exceedingly slight, and yet the patient died within twenty-four hours. Dr. Peters believed in the local origin of constitutional diseases.

DR. ANDREW H. SMITH remarked that there were quite a list of constitutional diseases with which sore-throat was more or less frequently associated. Besides the one under discussion, there were typhoid and typhus fevers, measles, small-pox, diphtheria, and syphilis, and perhaps some others. Most of those diseases were communicated through atmospheric agency or in some unknown way; but small-pox and syphilis might be introduced into the system at a known point distant from the throat, and yet throat symptoms result. Small-pox, the result of direct inoculation upon the surface of the body, was as likely to cause angina as if communicated through the atmosphere. Syphilis introduced into the system at any

point produced throat lesions. Those facts, together with the widely different diseases with which sore-throat was found associated, pointed to some peculiarity of the location which predisposed it to be the seat in which constitutional poisons worked out their local action; and this peculiarity probably consisted in the extreme glandular activity of the part.

Dr. S. also suggested that the effect of glandular action might be seen in the cutaneous eruption in scarlatina. The eruption was punctate, and probably each minute point would be found to correspond with the orifice of a perspiratory duct, the integument being irritated by a poisonous element which was being eliminated with the perspiration.

Dr. Hanks related some rapidly fatal malignant cases—one lasting only twelve hours—which had occurred in his early practice, and had upset a theory which he had previously held that all cases of the disease were curable. He considered Dr. Billington's statistics, showing that fifty per cent. of children exposed to the contagion of the disease might escape it, as interesting and important. He thought there were physiological reasons why the eruption should appear in the throat sooner than on the cutaneous surface.

Dr. Billington said, in concluding the discussion, that the fact referred to by Dr. Smith, of the appearance of throat congestions in connection with many constitutional diseases, had not been unthought of by himself. If it could be shown that angina was constantly the earliest secondary symptom in diseases which could not be supposed to originate in the throat—as, for instance, syphilis—it would militate strongly against the hypothesis of the reception of scarlatinal poison at that point. But he had not observed, nor been able to learn from others, that such was the fact; and he inquired if any of those present could say that it was. The point, however, was not essential to the rest of his argument; the chief object of which was to show that certain local morbid processes, however produced, might be the real causes of the constitutional disturbances in the disease.

With regard to the apparent difficulty, which had been spoken of by several in the discussion, of accounting for the phenomena of malignant cases on any other hypothesis than the generally accepted one of an overwhelming blood-poison, Dr. Billington said that he had anticipated the objection, and had endeavored to meet it in the paper which he had read. He thought that in considering this point one generally admitted principle should have its due weight. That principle was, that it was not in the exceptionally malignant forms of any disease that we could best study its natural history. Diseases—especially specific ones—could for obvious reasons best be examined and analyzed in typical cases of medium severity. He thought that the difference between the nerve-disturbances, often seen at the onset of such cases of scarlatina, and those that occurred early in the most malignant forms, was one of degree rather than of kind. He referred to cases of ordinary follicular tonsillitis which he had himself seen in young children, accompanied by convulsions and other severe nerve-disturbances and high temperature, and thought that the still more intense local irritation, which he had pointed out as probably present in the scarlatinal angina, might account for the greater severity of the earlier phenomena in malignant cases. This being the starting-point, blood-change and other complications would, as he had further indicated, follow with especial rapidity.

Dr. Beverley Robinson referred to the fact that some attempts to inoculate diphtheria in the fauces had been unsuccessful, and remarked that, owing to the greater thickness of epithelium in that situation, local absorption of poison would be less likely to occur there than further down in the air-passages. He also stated that he had in some instances seen faucial redness contemporaneous with primary chancre.

The Academy then adjourned.

Stated Meeting, March 21, 1878.

Dr. S. S. Purple, President, in the Chair.

LAPARO-ELYTROTOMY AS A SUBSTITUTE FOR CÆSAREAN SECTION.

Dr. T. Gaillard Thomas read an important paper upon the above subject, gave a detailed report of all the cases in which the operation had been performed, and set forth the advantages which it had over that of Cæsarean section.

The operation had been performed only once prior to the date at which Dr. Thomas performed it in 1871, and then by Ritgen. It had been performed upon the living woman since that date *five* times, three times by Dr. A. J. C. Skene, of Brooklyn, and twice by himself. Of the five mothers *three* were living, and the number of children delivered alive was *four*. No such results could be shown for the Cæsarean section, and no better results had followed embryotomy. All the cases had been reported and published, with the exception of the last, which was operated upon in December, 1877.

The operation was simple, and consisted of making an incision through the abdominal walls from the spine of the pubes to the anterior superior spinous process of the ilium, lifting the peritoneum, making an incision through the upper portion of the vaginal wall, tilting the body of the uterus over to the opposite side, and then, through the dilated cervix, delivering the child by version, by the forceps, or by extraction. Delivery was to be effected by version in arm-presentation; by forceps when the head presented; and by extraction in breech-presentation. Hemorrhage was one of the things to be feared in the operation; but in five cases no hemorrhage had occurred, and why should it occur in future operations? But, even admitting that hemorrhage occurred, it became a question whether the risks should not be taken, because the risks of peritonitis and shock following other operations were avoided. The dangers of Cæsarean section were peritonitis, metritis, hemorrhage, shock, incarceration of the intestines in the uterus, and septicæmia. By the operation of laparo-elytrotomy the danger from peritonitis, metritis, and incarceration of the intestines was entirely avoided, and, in a great degree, the danger from septicæmia and shock was diminished. The operation might be followed by hemorrhage, and, in place of peritonitis, cellulitis might be developed. Dr. Thomas did not regard laparo-elytrotomy as yet an established standard operation, but he did regard it as an operation sufficiently tested by experiment to deserve a careful consideration at the hands of the medical profession.

The paper being before the Academy for discussion, Dr. Fordyce Barker was called up by the President and spoke as follows: *Mr. President and Gentlemen:*—I am sure I express the universal feeling of all present in congratulating the author of the paper for his genius in devising this operation, for his success in performing it, and for his ability in giving us this most interesting paper. But here I may express the hope that if the gifted author is going on to devise new operations of such importance, he will give such names to them

as will be significant and easily understood by those of us who ordinarily use simple English, and enable us to follow the advice of Hamlet to the players, "Speak it trippingly from the tongue." There are many surgeons in this country who understand Pirogoff's operation, and are perfectly competent to perform it, who would hardly know what was meant if it were called by some name of Greek derivation. In speaking of the operation now under discussion I shall use a term more easy of utterance by my vocal organs, and call it "Thomas' operation."

The paper to which we have listened this evening opens an immense field for discussion, and I could not help but feeling, while it was being read, that the number of points involved in the discussion of this question, in connection with obstetrics, is greater than in any other operation which has been devised in modern times. It would, therefore, be utterly impossible, in an extemporaneous speech, to do anything like justice to all the points suggested by it, and I must simply attempt to give a broad and comprehensive view of some of them in a most cursory and superficial manner, as I know there are others present whom all will be anxious to hear.

The subject involves discussion not only of great questions in science, but also questions of professional morals, which it seems probable must be reopened and new points established in relation to them in our practice.

First.—This operation, as a question of science, is to be compared with Cæsarean section. Is "Thomas' operation" to take the place of Cæsarean section as a whole, or only in a limited class of cases? This is one of the questions which I presume every one will ask. That it will be an accepted operation in some cases, I am perfectly sure. I do not mean to imply that the author has assumed the position that his operation will entirely take the place of the Cæsarean section; but I ask, on my own part, whether it is to take such a place—and whether it will prove to be so much safer as to lead us to give up the Cæsarean section entirely? This question can be answered only by careful study of all the conditions, and by an experience which will require a long period of time to accumulate.

There is one consideration which was not alluded to in the paper, and it is this: I have no doubt that the author of the paper fully believes that when, in the course of time, all the conditions necessary to the successful performance of Cæsarean section have been studied with the same carefulness, with the same minuteness, and the same amount of experience has accumulated as we now have in relation to the operation of ovariotomy, that the mortality from the Cæsarean section will be greatly diminished. I am not sure that the mortality from that operation will be found to be any greater than the mortality which will result from the operation which he proposes to substitute for it in a majority of cases. For, while the author of the paper has given a clear statement relative to the comparative danger in the two operations, with all due respect, I am not quite prepared to accept all the results just as he has stated them, or to exclude all the dangers referred to as belonging to his operation, and which he seems to believe belong to the Cæsarean section. Of course it will be profitless to discuss this theoretical question. I say, however, that I think it is possible that, with improvement in the future, the mortality from Cæsarean section may be so reduced as to make it nearly as safe, or perhaps more safe in some cases, than the operation proposed by Dr. Thomas. Improvements in operations and in methods of management are constantly being made. One of the great dangers of Cæsarean section is subsequent septicæmia resulting from entrance of lochial discharge into the cavity of the peritoneum. It has been proposed as a method of obviating this danger, after the abdominal walls have been opened and an incision into the uterus has been made, to bring the uterine and the abdominal walls together by means of sutures, so as to bring the peritoneum of the uterus and that of the abdominal walls directly in contact, before removing the fœtus and placenta. Lestocquoy, who first suggested this modification, which, it seems to me, will prove a great advance in the method of performing the Cæsarian section, tested it in one case and was successful.

Tarnier has performed this operation twice, and in both cases the women died of gangrene of the uterus but this result cannot be regarded as due to this modification. One of his cases, however, was complicated by the fact—a rare circumstance—that the placenta was situated upon the anterior surface of the uterus. Now, it becomes us all, and I presume no one is more anxious than the author of the paper, to thoroughly investigate every possible point and ascertain the exact importance and the true value of the operation which he proposes.

If it should come to pass that in a certain number of cases the danger of one operation is found to be no greater than the other, this advantage, which, perhaps, it may be well to consider, will follow the Cæsarean section, viz., the condition of the patient is much more favorable than after the operation which has been brought forward. For, if it results favorably, it leaves no lesions behind it, no condition of the patient which hinders her from performing the functions of a wife and a mother as well as before the operation is performed.

Second, let us consider this operation in its relation to craniotomy. Is craniotomy to be abolished from now henceforth and forever as a legitimate obstetric operation? No one would propose the operation devised by Dr. Thomas when the fœtus is dead, except in the very rare circumstances under which it was performed by Dr. Skene. Consequently the question remains to be discussed—Suppose the fœtus to be *living*, whether hereafter and forever Thomas' operation is to abolish the operation of craniotomy? By craniotomy it must be remembered that I mean the operation of the present day, with all the improvements resulting from the use of the cranioclast and the cephalotribe. These improvements make the operation, with regard to the safety of the mother, altogether different from what it was formerly.

I fully agree with the hint thrown out by the author of the paper, that, in settling any of these obstetric questions, arguments based upon statistics are entirely valueless. Take, for instance, the operations both of Cæsarean section and of craniotomy: in these statistics are included those cases in which, before the operation, the woman is exhausted and unfit to bear any operation; all those cases in which the operations are improperly performed, and performed by improper instruments; and all those cases in which the operations are performed by inexperienced and inexpert obstetricians. Consequently such cases as these should have no bearing in settling the question whether or not the operation is justifiable or expedient.

If "Thomas' operation" is to abolish that of craniotomy in those cases in which the fœtus is living, we must necessarily, in certain respects, review, and I may say almost revolutionize, the obstetric ethics

of the profession. If there is any one *canon* settled in obstetric science as regards ethics, and accepted universally by all creditable authorities, it is this: where the obstetrician is compelled to make an election, whether the life of the mother or the life of the child is to be preserved, he is to preserve the life of the mother. As a direct consequence of this doctrine, it necessarily follows that no obstetrician has a right to perform an operation to save the life of the child in which there is serious risk for the mother, when by another operation that danger can be entirely avoided, although it sacrifices the life of the child. I wish to say distinctly that, while I believe I am correct in saying that every obstetric authority of any weight, both in this country and in Great Britain, holds to this view, I do not say that it is exactly my own view; I think I should qualify it somewhat.

But then comes the question, Is there any obstetrician who would be sustained by the profession in performing an operation which must involve some risk to that mother, when it is perfectly certain that we have a method of extracting that fœtus without any danger to the mother from the operation. I believe I am safe in saying that no physician would be sustained by the moral sense of the profession in doing it, if it became a question for trial or discussion.

Now, then, it is believed by all competent obstetricians that craniotomy can be performed with perfect safety to the mother with a contraction of the antero-posterior diameter down to two inches, provided there be a transverse diameter of three inches and the diameters of the inferior strait are normal. With our modern improvements in instruments and our present knowledge of the mechanism of labor, Barnes, Braxton-Hicks, and many other eminent authorities believe it possible and safe, with a contraction of the antero-posterior diameter to one and three-quarters, and even one and a half inches. In these cases, for the sake of saving the child, are we justified in performing an operation which involves serious danger to the mother?

These are very delicate points to settle. Where are the limits? When shall we say that Thomas' operation shall be performed under the hope and expectation of saving the life of the child, but, it must be stated, with a certain amount of risk to the mother? While every conscientious, honest obstetrician would carefully ask himself these questions, enthusiasts and partisans would promptly and dogmatically answer them one way or the other, according to their special moral and mental bias.

I will close by saying this: whatever the future may determine as to limit in the class of cases to which Thomas' operation is applicable—whatever the discussion of the future may be as to how far it is to take the place of Cæsarean section or of craniotomy, I am certain that the great merits of the operation will be so established in obstetrics by the profession at large, and throughout the entire world, as to satisfy the ambition of any man, to be regarded as a great contributor to the advance of the obstetric art in a limited class of cases. It struck me, while listening to the paper, that one of the cases of Dr. Skene furnished one of the most brilliant triumphs of the obstetric art of which I have any knowledge. As I see Dr. Skene present, I am sure that the President would do us all a favor by calling upon him for an expression of his views in regard to the operation.

Dr. A. J. C. Skene, upon invitation, remarked that he had had no regrets in following in the footsteps of Dr. Thomas with reference to the operation under consideration. He had performed it three times, and with results such as had been stated. The paper included all his former knowledge upon the subject, and much that was new to him; hence, he did not wish to occupy the time of the Academy in its discussion.

Dr. T. C. Finnell referred to three cases in which he had performed Cæsarean section under very unfavorable circumstances. All the mothers died and two of the children. He was of the opinion, however, that the Cæsarean section was the safer operation. He raised his solemn protest against taking the life of the child under any circumstances. When the child was dead, there was an operative procedure to which resort could be made.

Dr. Pallen regarded laparo-elytrotomy, or Thomas' operation more properly called, as one which was destined to take the place of Cæsarean section. He was of the opinion that to Dr. Thomas belonged the credit of devising the operation.

Dr. Thomas, in closing the discussion, remarked regarding the name of the operation, that he was forced to select the term laparo-elytrotomy, because it was the only one which was not in some way intimately associated with other operations.

The weakening of the uterine walls which inevitably followed Cæsarean section was avoided by laparo-elytrotomy, and thereby one of the important causes of rupture of the uterus was avoided.

One reason why rupture of the vagina during labor was so generally followed by fatal results was because it gave opportunity for infiltration of the adjacent tissues with discharges from the uterus. There was nothing in rupture of the vagina simply which would kill a patient; for rupture into the bladder very seldom destroyed life, and it was because free drainage could take place. When, however, rupture of the vagina occurred in its lower portion, so that the cellular tissue of the pelvis could become involved, the accident was very serious; but by this operation the opening into the vagina was made so that free drainage could be secured. The drainage could be facilitated by injection of antiseptic fluids, and thus the tendency to septicæmia avoided. The opening being made upon one side of the vagina, it was thought that it would remain closed, and it was believed that the calibre of the vagina would not be interfered with. With regard to the ethical question, the paper was entitled Laparo-elytrotomy as a Substitute for Cæsarean Section, and special pains had been taken not to bring the operation forward as a substitute for craniotomy. He was very sorry, indeed, to think that any physician could not take, under certain circumstances, the responsibility of destroying the life of the child. He believed there were circumstances which would justify him in taking the life of another man; and he also believed that he who stood upon the bank of a canal and saw a person drowning, and did not make some effort to save that person, was nearly as guilty as he who pushed the person into the canal with the avowed purpose of drowning him. The obstetrician who stood by the bedside waiting for the child to die was nearly, if not quite, as guilty as he who took the life of the child.

The Academy then adjourned.

New York Pathological Society.—In Dr. J. C. Peters's address before the N. Y. Pathological Society, the names of Drs. E. Krackowizer and Frank H. Hamilton were accidentally omitted in the list of former Presidents.

The Hunter's Point Nuisance.—The bill for the abatement of the Hunter's Point nuisance, which has been before the Assembly since January 23d, has been recommitted by a political trick, and the prospect of its prompt passage is very poor.

Correspondence.

THE COMMITMENT OF THE INSANE.

To the Editor of The Medical Record.

Sir:—Referring to the case of Miss Dickie, in his letter to the Record of last week, Dr. Bradley speaks of "the fact that she is not, *and has not been* insane." That she is not now insane I am ready to admit, upon the evidence of the experts and the verdict of the jury. But what right have we to assume that she was not insane six years ago, at the time of her examination "by perfectly competent men, according to due process of law." I am also quite prepared to believe, not only upon the reputation of those gentlemen for knowledge and integrity, but from a large experience of similar cases, that Miss Dickie was insane at that time, and that her confinement was perfectly legal and proper. At any rate, there can be no doubt, as you have said, that the recent examination and verdict "should not be held to prove that there was a dreadful mistake made in committing her to the asylum" in 1872.

But we are obliged to suppose that at some time in these six years Miss Dickie became sane, without her return to sanity having been recognized, or at least without its having led to her release. And there is no denying that this fact has tended seriously to weaken public confidence in asylums. How to guard against the occurrence of such abuses, is the question.

The plan of increasing the delays and difficulties of commitment to asylums, in order to prevent the incarceration of sane people, certainly does not meet the requirements in cases like that of Miss Dickie, and I believe it is now generally conceded to be unwise and unnecessary.

The scheme of a lunacy commission, composed in part of experts in mental disorders, to whom all the insane shall have free access by letter, and who shall frequently visit asylums and have power to discharge their inmates summarily, has proved useful in other countries, and is certainly worthy of trial.

But there is another, and I believe a far more effective, safeguard against the peculiar abuses of asylums. It is an obvious one, and has been often proposed, but has not been adopted, mainly because of the determined opposition of the Association of American Superintendents of Insane Asylums. The plan is, to confine the medical head of an asylum to his medical duties alone, devolving the labor and responsibility of its business management upon a superintendent or warden. At present the non-medical affairs of asylums occupy all the time of their medical superintendents, and medical duties are left to be performed by the assistant physicians. Now, it is obvious that the delicate and most important duty of examining into and judging the mental condition of patients cannot be delegated. To delegate such a responsibility is practically to dissipate it. On this point nothing more need be said.

There is another still more cogent reason for relieving medical officers from the financial responsibility of asylums. The law which carefully forbids them to certify the insanity of any one for the purpose of committing him to an asylum, gives them an irresponsible and nearly absolute control over the patient when in their care. If this is perhaps unavoidable, certainly it affords the best reason why these officers should not be placed under a strong temptation to abuse their trust, by charging them with the entire financial management of their asylums. Unless they chance to be made of wholly different stuff from other public officers, all the consequences pointed out by Dr. Wilbur will surely follow. Public patients will gradually be crowded out of asylums to make room for the private class, who can pay higher rates. The convalescent will be kept so long as perhaps to become insane again, from a rankling sense of neglect and injustice. Those who most need care will be sent away or refused, because there is little profit in keeping them; while quiet cases, who would do as well at home, are retained for an opposite reason. There will also be the danger of so overcrowding asylums with patients as to neutralize the advantages of care and treatment which they should afford.

Surely, it is not too much to insist that in a decision involving the liberty and sanity of an innocent and most unfortunate fellow-being, the judgment of a medical expert should not be exposed to the least bias from the source indicated. Let me enforce the argument upon this point, by the authority of Dr. Earle, the venerable superintendent of the Northampton (Mass.) Lunatic Hospital. He believes that the number of those set down as "recovered" in the returns of a lunatic asylum may differ 25 per cent., according to the person who decides upon their condition. In other words, he holds that vanity and self-interest may act unconsciously on the mind of a superintendent to add 25 per cent. to the true number of his recoveries. It is plain that if these motives may operate to such a degree in deciding the condition of discharged patients, they may act equally in determining the condition of patients with reference to the question of their discharge. Surely, the system which permits such considerations to affect, consciously or unconsciously, the minds of medical officers of asylums, cannot be too speedily reformed.

L. A. Tourtellot, M.D.

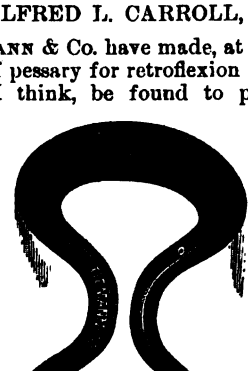
Utica, March 18, 1878.

New Instrument.

A NEW RETROFLEXION PESSARY.

By ALFRED L. CARROLL, M.D.

Messrs. Tiemann & Co. have made, at my suggestion, a new form of pessary for retroflexion or retroversion, which will, I think, be found to possess peculiar



advantages in certain cases. It is constructed of a steel spring covered with india-rubber, and its "hour-glass" shape, as shown in the accompanying wood-cut, serves a double purpose.

In the first place, the central constriction furnishes the same sort of elastic extension as is given by the spring in Scattergood's pessary; and in the second place, the contraction of the vagina around this central constriction tends to increase the supporting power of the instrument, while conducing to the comfort of the wearer. The material is sufficiently pliable to be bent into the required curve for any given instance, and its elasticity in all directions enables it to yield to a certain extent to the patient's movements without altogether relaxing its support.

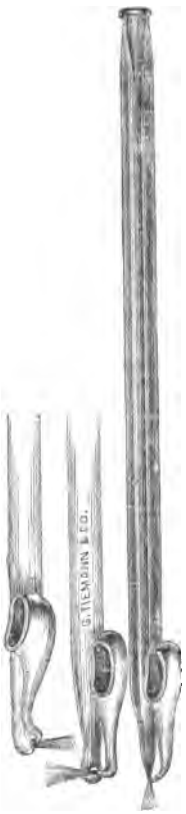
NEW BRIGHTON, N. Y., December, 1877.

ATOMIZERS FOR SPRAYING THE THROAT.

BY H. T. HANKS, M.D.,

NEW YORK.

THE set of atomizers represented in the cut are arranged for spraying the throat, and are exceedingly convenient for the general practitioner as well as the specialist. The set consists of three straight tubes of strong glass, seven inches in length, tapering at the distal end to a point with only a small perforation. On the right side of this extremity a second little funnel-like tube is strongly cemented. This is for holding the few drops of the medicament to be used, and may be filled from the bottle or with a pipette.



As may be seen in the cuts, in one instrument the point of the medicine-tube is exactly in front of the air-tube; this is for throwing the spray directly into the throat. In the other two a variation in the direction of the tube gives a corresponding direction to the spray, so that it may be thrown upward with one instrument and downward with the other.

A common Davidson syringe or rubber air-bulb may be attached to the proximal end of the long tube for forcing the air through.

Both tubes, for an inch from the distal end, are flattened on their under surface, and roughened, and serve the purpose of a tongue-depressor.

The advantages claimed for these atomizers are as follows: 1. They are compact. 2. They are inexpensive. 3. Only the necessary quantity of medicine need be used. 4. The throat is surprised, not by a preliminary gush of air, but by the instantaneous application of the remedy directly to the affected parts, before any contraction can take place.

149 LEXINGTON AV.

DR. JAMES BLUNDELL died recently in London, aged 87. As early as 1828 he successfully removed the uterus. In his mode of practice he was somewhat eccentric. He rarely arose before noon, and would receive patients at his home until six in the evening. After dining he would make his calls until midnight, and do his reading by lamp-light in his carriage.

ARMY NEWS.

Official List of Changes of Stations and Duties of Officers of the Medical Department, United States Army, from March 17 to March 28, 1878.

VICKERY, R. S., Capt. and Asst. Surgeon. Granted leave of absence for four months, with permission to go beyond sea. S. O. 58, A. G. O., March 18, 1878.

LORING, L. Y., Capt. and Asst. Surgeon. Relieved from duty in Dept. of Arizona, and on expiration of his present leave of absence, ordered before the Army Medical Board, New York City, N. Y., for examination for promotion, and on completion of examination to report by letter to the Surgeon-General. S. O. 59, A. G. O., March 19, 1878.

March 23, 1878...	0	5	92	3	81	82	0

THE HANGING OF POLISH SURGEONS.—An Austrian paper, in its issue of Feb. 24th, reports the hanging of four Polish surgeons by the Russians at Sophia. The Turks, when they left the city, had no time to remove their wounded, who remained under the care of five surgeons, who trusted in the Geneva Convention to protect them. All five of them were Poles, but four of them were Austrian subjects, and none of them had taken up arms against Russia. Three of them were at once thrown into prison, but the fourth, who was supposed from his name to be a German, was retained a few days to care for the Russian sick. As soon as his nationality was discovered he was sent into prison with his comrades. Soon after all four were taken to a public square and hanged. The fifth, M. Czerwinski, possessed an English passport, and was saved by the intervention of the British consul. He was present at the execution of his friends and brought to Vienna the news of their melancholy death.

OVERCROWDING IN THE PROFESSION.—Not long since a medical gentleman, advertising to dispose of a paying practice, received nearly two hundred applications, while another seeking for an opening was singularly neglected.

LISTER'S METHOD.—One reason why operations are nowadays so successful is probably owing to the fact that before they are commenced the operator very properly says, "Let us spray."

DEATH PREMIUMS BY UNDERTAKERS.—A London undertaker is making base proposals of commissions to the physicians of that city for sending customers to him. He has his eye doubtless on some of the most active members of the Pathological Society. Naturally much indignation is aroused, notwithstanding there is a promise to treat relatives at wholesale rates.

K. & M.

GRANULATED EFFERVESCENT

PEPSIN, BISMUTH, AND STRYCHNIA.

ORIGINATED BY KEASBEY & MATTISON.

We again offer this preparation confidently to the profession. It has for four years enjoyed an extensive prescription among the most eminent of our practitioners. Its use has been attended with the most marked success perhaps of any of the various remedies recommended in dyspepsia, gastralgia, and kindred disorders. Its association with Carbonic Acid renders it palatable, and causes it to be retained by the most sensitive stomach. It is the only soluble form in which Pepsin and Bismuth should be ever given together, and is FIVE TIMES THE PEPSIN STRENGTH of the various elixirs, wines, liquors, etc., of the market. In reference to its reliability, we refer to the most prominent physicians in all sections of this country, who will very generally be found to be using it in their practice.

Always prescribe the GRANULATED EFFERVESCENT form, and always specify the "K. & M." preparation.

Each drachm or heaping teaspoonful contains FIVE GRAINS Saccharated Pepsin, two grains soluble Citrate of Bismuth, and one-fiftieth grain Citrate of Strychnia.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 21, 1877.

Gentlemen.—I have used a large number of your preparations for several years past with great satisfaction, and am happy to commend them to others from what I know both of your drugs and of yourselves. Very truly yours, W. W. KEEN, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE CAFFEINE.

ORIGINATED BY KEASBEY & MATTISON.

The recent extensive employment of this salt as a remedy, amounting almost to a specific in cases of sick headache, and its use in nervous diseases generally, have caused us to place it upon our list. Its value is much enhanced by its administration with Carbonic Acid, so agreeably and efficiently produced by this form.

A heaping teaspoonful, containing ONE GRAIN of Citrate of Caffeine, should be given in a sick headache, every hour or two before and during the paroxysms.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 27, 1877.

Gentlemen—It gives me pleasure to add my testimony in regard to your preparations, which I have used for a long time; they are thoroughly reliable. Truly yours, THOMAS G. MORTON, M.D.

K. & M.

GRANULATED EFFERVESCENT

CITRATE LITHIA.

In the effervescent form this chemical is administered in a peculiarly advantageous manner. Its association with Carbonic Acid renders it much less liable to disturb the stomach, while in strength it is greatly superior to Lithia Water. A valued diuretic and lithontriptic, its importance in the treatment of rheumatic, gouty, and analogous disorders can scarcely be over-estimated.

We have doubled the strength of this preparation, each drachm or heaping teaspoonful containing FOUR GRAINS of the chemically pure salt.

Messrs. KEASBEY & MATTISON: PHILADELPHIA, September 25, 1877.

Gentlemen—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, M.D., *Secretary American Medical Association.*

PHOSPHORUS PILLS—PRICE REDUCED.

Believing that the present demand for Sugar-Coated Pills of Phosphorus and its combinations will justify a reduction of the price, Messrs. Allaire Woodward & Co. have modified their list on these pills, as follows:

Phosphorus, 1-100 gr. per 100 - - -	40c.
" 1-50 " " - -	40c.
" 1-25 " " - - -	40c.
Phosphorus Comp'd, {Phosphorus, 1-100 gr. Ext. Nux. Vom., ½ "}	50c.
" and Nux. Vom. {Phosphorus, 1-50 " Ext. Nux. Vom., ½ "}	50c.
" Iron & Nx. Vm. {Phosphorus, 1-100 " Vallet's Mass 1 " Ext. Nux. Vom. ½ "}	60c.
Ph s., Iron & Quinine, {Phosphorus, 1-100 gr. Vallet's Mass, 1 " Quinia Sul., 1 "}	——
Phos., Iron, Nux & Quin., {1 hosphorus, 1-100 " Vallet's Mass. 1 " Ext. Nux. Vom. ½ " Quinine, Sul., 1 "}	——
Phosphide Zinc, 1-2 gr. per 100 - -	$1 25
" 1-4 " " - -	80
" 1-8 " " - -	60
" and Nux, each 1-8 gr. -	60
" Nux & Ext. Can'bis Ind. ea. 1-8 gr.	65

The manufacturers feel confident that by their mode of manipulating the mass, *less of the objectionable effects* will be experienced by the patient, and *better results* obtained than by the use of any similar goods in the market. *Pills will be mailed to any part of the world upon receipt of list price.* Complete lists of Sugar-Coated Pills. Fluid and Solid Extracts mailed upon application.

ALLAIRE WOODWARD & CO., Peoria, Ill.

The attention of the medical profession is invited to this instrument as the most perfect ever invented for treating Prolapsus Uteri, or falling of the Womb. It is an Abdominal and Uterine Supporter combined.

The Abdominal Support is a broad morocco leather belt with elastic straps to buckle around the hips, with concave front, so shaped as to hold up the abdomen.

The Uterine Support is a cup and stem made of very highly polished hard rubber, very light and durable, shaped

to fit the mouth of the womb, with openings for the secretions to pass out, and which can be sent to any curve desired, by heating in very hot water.

The cup and stem is suspended to the belt by two soft elastic Rubber Tubes, which are fastened to the front of the belt by simple loops, pass down through the stem of the cup and up to the back of the belt. These soft rubber tubes being elastic, adapt themselves to all the varying positions of the body, and perform the service of the ligaments of the womb.

The instrument is very comfortable to the patient, can be removed or replaced by her at will, can be worn at all times, will not interfere with nature's necessities, will not corrode, and is lighter than metal. It will answer for all cases of Anteversion, Retroversion, or any Flexion of the Womb, and is used by the leading Physicians with never-failing success, even in the most difficult cases.

Price—to Physicians, $8.00; to Patients, $12.00

Instruments sent by mail, at our risk, on receipt of price, with 16 cents added for postage; or by express C. O. D.

Dr. McINTOSH'S NATURAL UTERINE SUPPORTER CO., 296 West Lake Street, Chicago, Ill.

Our valuable pamphlet, "Some Practical Facts about Displacements of the Womb," will be sent you free on application.

As the extreme scarcity of Quinine both in Europe and America will probably not be relieved until summer, and manufacturers have been unable to supply our wants, we have been obliged to again advance our list of Quinine Pills, as below.

Since we changed, last fall, from Unbleached to Bleached Quinine in the manufacture of our Pills, we have heard from a large number of druggists and physicians stating that the therapeutical effects of the dark pills were better than the "bleached," dose for dose, where a tonic was indicated, and the antiperiodic effects of the former were as well marked. We made the change because we were disappointed in obtaining a uniform article of unbleached Quinine, were deceived in two shipments we received and the analyses of samples from the same package we submitted to different highly reputable chemists varied surprisingly. In fact, analysing Quinine *quantitively* is very difficult, as it depends very largely upon the different solubilities of the alkaloids in water, while the *qualitative* analysis is very simple and reliable.

The curative properties of the other alkaloids of Cinchona Barks have been well attested and the effect of the **combined alkaloids** has been repeatedly asserted to be greater than that of any **one alone.**

In view of these facts, we accordingly propose to offer Pills made of Hospital Quinine, which differs from that which has been known and understood as "unbleached," in the process of manufacture and in the proportion of Quinine. This Hospital Quinine will contain about 50 per cent. of Quinine Sulphate, and the balance, Cinchonidia Sulphate and traces of Quinidia Sulphate; the Cinchonia Sulphate, being less powerful than the other alkaloids is separated.

These pills on account of their lower price will relieve a difficulty, to which a large number of people living in malarious districts have been subjected—the inability to purchase Quinine Pills on account of price, especially when scarcity causes sudden and great advances, as at present—at the same time we believe that confidence may be felt on experiencing equal relief with similar doses.

We will continue, as now, to make our "Quinine Pills" of bleached Quinine, and the white color will readily identify them from our darker Hospital Quinines, which will be labelled "Hospital Quinine" The list of Hospital Quinine Pills we submit below is subject to same discount as our other pills, and will be reduced as soon as the market on Quinine will allow. We call special attention to our Pills of Cinchona Bark Alkaloids, which contain a definite quantity of each of the four alkaloids, one half grain each Sulphates Quinia, Quinidia, Cinchonia and Cinchonidia.

We annex below list of our Pills of other Cinchona Alkaloids, and remain, soliciting your correspondence and valued orders, Yours respectfully,

March 27th, 1878. McKESSON & ROBBINS.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL, and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist,

Explanatory Circular mailed on application.

(P. O. Box 4,517), 2 and 4 Platt Street, New York.

LOEFLUND'S EXTRACT OF MALT

Is recommended to physicians for its **purity** and **superiority** over all others. It is perfectly free from **Alcohol, Carbonic Acid and Empyreumatic Products**, which can only be attained by the **most careful manipulations** in its manufacture, **long experience**, and by means of **unexcelled apparatus.** Mr. Ed. Lœflund, of Stuttgart, Germany, manufactures only Malt preparations, devotes his whole time to these; and being a thorough Chemist, makes a preparation based upon **scientific principles.** For this reason his Preparations were awarded a **prize** at the **Centennial Exhibition. Lœflund's Concentrated Extract of Malt** is a **Resolvent Emollient** and most powerful **Nutrient.** It is used for diseases of the **respiratory organs, pulmonary complaints,** and for diseases originating in **imperfect digestion.**

Price per bottle, 75 cents.

VACCINE VIRUS.

In order to meet properly the continued demand upon us for **Animal Virus**, we have established stables for its propagation upon carefully-selected heifers. The lymph used is of the well-known "Beaugency" stock, imported by ourselves expressly for this purpose. The result of several years' experience in supplying this lymph leads us to believe that its excellence is unsurpassed. The establishment is under the care of a competent physician, who will spare no pains to produce a perfectly **reliable** and **pure** article, which we are prepared to furnish **fresh, daily.**

We can also furnish, to those who prefer it, **Humanized Virus**, from healthy children, procured for us by physicians of undoubted reliability.

All our Virus is put up in strong, *air-tight, sealed packages*, for safe conveyance by mail or express, and will be sent (postpaid if by mail) upon the following terms:—

From the Heifer,	10 large Ivory Points, well charged on both sides		$1.50
	5 large Ivory Points,	" "	.80
	Large Ivory Points, less than 5,	" " each	.25
	1 Crust, new method, in air-tight Glass Capsule		2.00
From Healthy Infants.	10 small Ivory Points		1.50
	1 Crust from Unruptured Vesicles		2.00

Directions for vaccinating with either form of Virus, derived from methods successfully employed, will be furnished with Virus, if requested.

We will warrant every package of Points and every Crust, giving a fresh supply in case of failure reported within fifteen days for Points, thirty days for Human, and ninety days for Kine Crusts. We can usually furnish Crusts one remove from the heifer, if preferred.

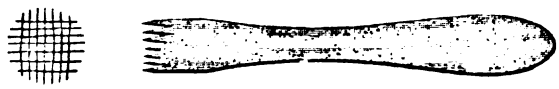
On account of their unreliability, we have hitherto furnished the usual form of Kine Crust unwillingly. Under our new method of taking and preserving them, however, after careful tests and an experience extending over several months, the results obtained have been so satisfactory that we now offer them as not less active and reliable than other forms of Virus, while less liable to become inert with lapse of time. We now offer them on very favorable terms, and recommend them for transmission to a distance, and in all cases where it is desired to preserve Virus for some weeks or months, or to keep a supply at hand for emergencies.

We also furnish **Uncharged Ivory Points**, for physicians' use, at the following rates:—

Small	per 100, 25 cents; per 1,000, $2.00
Large	per 100, 50 cents; per 1,000, 4.00

Orders by mail or telegraph answered by return train.

Liberal discounts upon large supplies for Cities, Towns, and Institutions.



Scarifying Vaccinator, Steel Nickel-Plated. See Cut. Each 25 Cents.

TO THE MEDICAL PROFESSION.

MALTINE.

(EXTRACT OF MALTED BARLEY, WHEAT AND OATS.)

THIS PREPARATION CONTAINS FROM THREE TO FIVE TIMES THE MEDICINAL AND NUTRITIVE ELEMENTS FOUND IN EXTRACT OF MALT.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat* and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST: In the manufacture of ***MALTINE*** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates and Albuminoids on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity possessing little virtue aside from the saccharine matter which it contains.

SECOND: *Carbon, Hydrogen, Nitrogen, Phosphorus, Sulphur, Iron, Magnesium* and *Potassium* are essential elements in the food of man; and it is only in ***MALTINE***, containing the combined properties of malted *Barley*, *Wheat* and *Oats* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD: *Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. ***MALTINE*** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH: LIEBIG says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley in the manufacture of ***MALTINE*** is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of ***MALTINE****, and would request a trial and comparison of merits with any article offered for similar uses.*

MALTINE AND ITS COMPOUNDS

Can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULAS AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**
This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOS. IRON AND QUINIA:**
A powerful general and nutritive tonic.

***MALTINE* WITH PHOS. IRON, QUINIA AND STRYCH.:**
A powerful nutritive, general and nervous tonic.

***MALTINE* WITH HYPOPHOSPHITES:**
This preparation is specially indicated in Phthisis, Rickets and deficient Ossification.

***MALTINE* WITH PEPSIN AND PANCREATINE:**
One of the most effective combinations in Dyspepsia, Cholera Infantum and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the ***MALTINE***. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**
One of the most valuable combinations in cases of general Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH COD LIVER OIL:**
The most perfect emulsion, and most agreeable and effective mode of administering this nauseous but valuable Oil yet discovered.

***MALTINE* WITH COD LIVER OIL AND PHOSPHORUS:**
In this combination the Phosphorus has no irritant effect upon the stomach.

***MALTINE* WITH COD LIVER OIL AND IODIDE OF IRON:**
This is prepared with the tasteless Iodide of Iron, which undergoes no chemical change from contact with the Oil, and does not blacken the teeth.

***MALTINE* WITH ALTERATIVES:**
In this preparation ***MALTINE*** is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.
Each fluid ounce contains: *Chloride Calcium*, 10 grains; *Chloride Magnesium*, 10 grains; *Bromide Sodium*, 5 grains; *Iodide Potassium*, 1 grain; *Iodide Iron*, ¼ grain. DOSE, One teaspoonful to one tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only*.

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in amber bottles holding sixteen fluid ounces; each bottle inclosed in a folding paper box.

THE BEST IS THE CHEAPEST.

"IN Burr's Improved Nursing Bottle all objections have been successfully overcome."

BURR'S Nursing Bottles

have been recommended and indorsed by all the leading Physicians and Druggists for the past ten years.

They are made of the very best and purest material, and by the most skilful workmen.

Nursing bottles and tubes should be thoroughly cleansed immediately after using. This is of the greatest importance, as the life of the infant depends on it.

It is almost impossible to get at the tube of the imitation Nursing Bottles in order to clean them. Carelessness in this respect is to be carefully guarded against, and the mother should look to it that this advice is followed. Restlessness, gastric irritation, griping pains and fits of screaming are the consequences of neglecting this matter, and ig rant people blame the bottle, when these results should be attri- bu d to the carelessness of the nurse and want of cleanliness of the bo le and tubes.

the genuine BURR'S IMPROVED NURSING BOTTLE, the nipple- h r tube-connector and mouth-guard are all ingeniously combined in or piece of hard, polished wood. It is so constructed that the nipples ar very firmly held, yet they can be easily taken off for cleaning the te and replaced in an instant.

AVOID DANGER

Al all nursing bottles where the nipple-holder, mouth-guard and te connector are of metal, or in more than one piece.

e genuine Burr's Improved Nursing Bottles are made in eight di ent styles, and retail at from twenty-five to seventy-five cents.

that the patent stamps are on the mouth-guard and stopper, and th he words "Burr's Patent Nursing Bottle" are blown in each bottle.

M . BURR & CO., Manufacturers, 485 Tremont St., Boston, Mass.

CORRESPONDENCE SOLICITED.

In corresponding with Advertisers please mention **The Medical Record.**

LEBAIGUE'S DIALYSED IRON,

Or PURE PEROXIDE OF IRON,

IN SOLUTION, WITHOUT THE AID OF ACIDS OR OTHER SOLVENTS.

It is nearly tasteless, does not blacken the teeth, is very readily absorbed, will not constipate, nor cause any disturbance of the digestive apparatus, and is tolerated by persons who could not support any other preparation of iron. It is offered in the form of a **solution,** which is generally preferred; or of an **elixir,** when a slight stimulant is desired.

Durel's Syrup of Tar and Iron.

Prepared by DUREL, Pharmacist, Paris.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron, is a desideratum which has at last been attained in this preparation. The indications for such a remedy are many, but it has been found especially useful in ***Chlorosis, Bronchial Catarrh, Catarrh of the Bladder, Chronic Uterine Discharges,*** depending upon an enfeebled or relaxed state of the system.

It is sold by chemists generally.

E. FOUGERA & CO.'S

MEDICATED GLOBULES.

The form of Globules is by far the most convenient as well as the most elegant form for administering liquid preparations or powders of unpleasant taste or odor. The following varieties are now offered:

Globules of **Ether; Chloroform; Oil of Turpentine; Apiol;**
Phosphorated Oil, containing 1-60th grain of Phosphorus;
Phosphorated Oil, containing 1-30th grain of Phosphorus;
Tar; Venice Turpentine; Copaiba; Copaiba and Tar;
Oleo-Resin of Cubebs; Balsam of Peru;
Oil of Eucalyptus; Cod-Liver Oil; Rhubarb;
Bicarb. of Soda, Sulph. Quinia, &c.

The superiority of these Globules over other forms consists in the ease with which they are taken, and in their ready solubility, and hence promptness of action.

They are put up in bottles of 100 each.

BLANCARD'S PILLS.

OF UNCHANGEABLE IODIDE OF IRON.

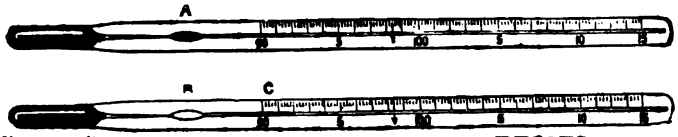
Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Pharmacien, No. 40 Rue Bonaparte, Paris,
without which none are genuine.

BEWARE OF IMITATIONS.

L. CASELLA'S NEW PATENT SELF-REGULATING

CLINICAL THERMOMETER, with INDESTRUCTIBLE INDEX.



This Thermometer, secured by letters-patent in England and the United States, is guaranteed not to become disarranged by any amount of violence, as the index is effectually prevented from descending below a fixed point. By this means medical men may, with implicit confidence, obtain personal observations of the temperature even from their patients, as no inadvertence in use, or rough usage in traveling, can possibly disarrange it.

PRICES:

No. 3. Casella's Patent Safety Clinical Thermometer, four or six inch, in neat pocket case..... **$6 00**

We also offer:

No. 2. Casella's Standard Clinical Thermometer, all sizes, in neat pocket case..... **3 50**

Sent free by mail on receipt of price. Manufactured by L. CASELLA, London.

L. REICH,

DIRECT IMPORTER OF THE CHOICEST AND PUREST

HUNGARIAN WINES

EVER BROUGHT TO THIS COUNTRY,

STRICTLY FOR MEDICINAL USE,

Respectfully informs the members of the Medical Profession that he has opened an office at

13 West 11th St., New York.

Those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES,** which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:

This is to Certify, that I have examined Mr. L. REICH'S TOKAYER AUSBRUCH, TOKAYER MASLAS, and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.

Prof. of Chemistry and Toxicology in Bellevue Hospital Med. Col., and Prof. of Chemistry and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. Reich and his Wines to our professional brethren.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HÆMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.
To be had of all Respectable Chemists throughout the world.

Trommer's Extract of Malt.

The rapidly increasing demand for our **IMPROVED EXTRACT OF MALT**, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantity; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or molding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made, is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The Extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops,** viz.: Malt Sugar, Dextrine, Diastase, Resin and Bitter of Hops, Phosphates of Lime and Magnesia, and Alkaline Salts.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:

Malt Sugar, 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712; Alkalies, .377; Water, 25.7. Total, 99.958.

In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article. Yours truly, SILAS H. DOUGLAS,

Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt, contains a larger quantity of the active properties of Malt, than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ lbs. of the Extract.

Our preparations of Malt are for sale by druggists generally throughout the United States and Canadas, at the following prices:

EXTRACT OF MALT,			**With Hops (Plain),**	**$1 00**
"	"	"	**Pyrophosphate of Iron (Ferrated),**	**1 00**

COSMOLINE

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

MANUFACTURERS OF

Electro-Medical Instruments and Batteries,

FARADIC MACHINES,
GALVANIC BATTERIES,
BATH APPARATUS, &c.

Sole Manufacturers of

Dr. Byrne's Perfected Galvanic Battery for Electro-Cautery

The only apparatus of the kind for which a special award was granted at the Centennial Exhibition in accordance with the Reports of Sir William Thomson and Professor Henry, based upon actual experiments.

It embraces the very latest and best improvements, and is by far **the most complete and powerful instrument yet devised for galvano-cautery operations.** It consists of 4 cells in a neat case 8¾ x 7¼ x 4½. **Its heating capacity is fifteen inches of No. 21 Platinum wire, or twenty inches of No. 18,** and it will maintain a current available for surgery during half an hour without change of fluid.

The weight of the entire battery is ten pounds. It is, therefore, conveniently portable and **the most efficient and reliable battery for galvano cautery yet offered to the profession.** Its distinctive peculiarity consists in the negative plates by which much greater power is obtainable than from carbon or Platinum, while they are equally indestructible with the latter. **These plates (patented) are also specially adapted for all battery organizations requiring great quantity and a high electro-motive force,** as for Electro-Plating, Electro-Motor for Sewing Machines, discharging explosives, etc.

WESTERN ELECTRIC MANUFACTURING CO.

20 New Church St., NEW YORK. 220 to 232 Kinzie St., CHICAGO.

NELATON'S CATHETERS,

Sometimes called Jacques', but really the invention of Dr. Nelaton, Surgeon to the late Emperor Napoleon III., have, by their decided advantages over every other kind, become a necessity in the practice of the leading Physicians and Surgeons of Paris, London, and other European Cities.

Their introduction here has been so successful that imitations are already in the market, much inferior in quality. Having secured a large stock from the original manufacturers during my stay in Paris, I am enabled to offer the genuine at a reasonable price.

These are made of *pure brown rubber*, with a smooth, soft surface, delicately flexible; and if the simple directions on the box are followed, their introduction will cause little or no pain, and effect their purpose much more easily and effectively than any other kind.

Sets of nine sizes, numbered and with wire, the whole neatly boxed, will be sent by mail on receipt of $6.00. THEO. RICKSECKER, 146 & 148 WILLIAM ST., NEW YORK.

PERFECTION SPONGE TENTS.

These Tents are the *very best in market;* in *quality of sponge, method of manufacture, strength, utility*, and *medication.*

The many complaints by the Profession against those commonly sold have encouraged the sale of the "Perfection," which will be sent in boxes of one dozen, assorted, by mail, on receipt of $2.50.

The maker holds letters of approval and recommendation from the following eminent Physicians:

J. Marion Sims, M.D., N. Y., | Washington L. Atlee, Phila.,
T. Gaillard Thomas, M.D., N.Y., | W. Byrne M.D., Brooklyn.

Address THEO. RICKSECKER, 146 & 148 WILLIAM ST., NEW YORK.

Quote MEDICAL RECORD.

FOUGERA'S COMPOUND IODINIZED

COD LIVER OIL

Since the introduction of this oil in 1858 it has been found to be superior to all other kinds of Cod-Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod-Liver Oil, but also the **tonic, stimulant, and alterative** properties of **Iodine Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod-Liver Oil.

Through its **increased curative action, FOUGERA'S COD-LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod-Liver Oil would fail entirely.

Fougera's Ready-Made Mustard Plasters.

A most useful, convenient, clean and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths:—Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll of 10 plasters each. DIRECTIONS.—Dip the plaster or plasters, a minute or two, in cold water; apply on the part, and cover with a band.

Fougera's Compound Iceland Moss Paste.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, &c. Wakefulness, Cough and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this paste.

Fougera's Iodo-Ferro-Phosphated Elixir of Horse-Radish.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of anti-scorbutic and aromatic plants, and acts as a **tonic, stimulant, emenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

SOLD BY DRUGGISTS GENERALLY.

RELIABLE ANIMAL VACCINE.

THE undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*

Physicians can obtain the **Animal Vaccine** of MESSRS. CASWELL, HAZARD & CO., Broadway, corner 24th Street.

FRANK P. FOSTER, M.D.

By our arrangement with Dr. Foster *all* Vaccine supplied by *us* is *absolutely fresh.*

We can furnish it in any quantity desired, either by express or by mail, if remittance is made to cover postage.

Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified endorsement of the medical profession of New York.

QUILL SLIPS (half quill, charged on convex surface, at square-cut end), 25 cts.
CAPILLARY TUBES, ... $2.00

For ordinary use, *quill slips* are the most reliable of all forms of stored Vaccine, and in cases of failure with them in *primary* vaccination, if used within one week of their issue, and strictly in accordance with the printed directions, *being in the meantime kept cool and dry,* a second supply will be furnished gratis.

Tubes are intended chiefly for transportation to long distances, as the virus is preserved for a considerable length of time. They are superior to crusts, but inferior to quill slips.

Crusts are not recommended, and are not sold, for the reason that, however fresh and however well formed they may be, they are apt to prove inefficient.

CASWELL, HAZARD & CO., New York.

Quote MEDICAL RECORD.

McKESSON & ROBBINS'
GELATINE-COATED PILLS.

COCA EXTRACT, 1 gr.
Made from freshly imported leaves. As the leaves become almost inert with age, a preparation of this nature is necessary to enable the Physician to judge correctly of the value of this remedy. Coca Erythroxylon is a South American plant, used by the natives as a substitute for tea, coffee, tobacco, hashish and opium of other countries. It imparts vigor to the muscles as well as to the intellect, and enables the partaker to endure great fatigue with ease. The feeling of exhilaration accompanying its use, is said not to be followed by any depressing effects.

ERGOTIN, 3 grs.
Each pill is equal to half a teaspoonful of officinal fluid extract. The value of Ergotin, in the place of the crude drug and the Fluid Preparations, is conceded; and it is being largely administered both in this country and in Europe.

GRINDELIA ROBUSTA-EXTRACT, 3 grs.
The Solid Extract is ten times the strength of the Herb; it can be used much more readily and with better effect than any of the liquid preparations. The use of this remedy in Hay Fever, and all Asthmatic difficulties, has increased largely in the Eastern States and Europe, and its therapeutic value is conceded. (Dose, 1 to 3.)

GUARANA EXTRACT (PAULLINIA), 3 grs.
The Solid Extract is eight times the average strength of the drug. The value of Guarana, in many phases of sick, nervous and sun Headache, as well as in Neuralgia, and in irritations of the mucous membrane, has become well-known to practitioners, and its happy effects, in Diarrhœa, Dysentery and kindred diseases, have been attested in numerous cases. (Dose, 2 to 3.)

JABORANDI-EXTRACT, 3 grs.
These pills present a much better and more acceptable form of administering this powerful Diaphoretic and Sialagogue, than any of the liquid preparations. Valuable in Rheumatism and all Syphilitic troubles of long standing. (Dose, 1 to 3.)

CALCIUM SULPHIDE, 1-10 gr.
Strongly recommended "in cases of Scrofulus and other unhealthy sores, glandular enlargement, boils occurring in crops, &c." In many skin diseases it is strongly indicated, being not only anti-parasitic and anti-herpetic, but also stimulant and tonic.

SALICYLIC ACID WITH MORPHINE.
{ Acid. Salicylicum, 2 1-2 grs. }
{ Morphiæ Sulphas, 1-12 gr. }

SALICYLIC ACID WITH MORPHINE.
[Acid. Salicylicum, 5 grs. Morphiæ Sulphas, 1-8 gr.]
Strongly recommended in Rheumatism, both acute and chronic.

SANDAL WOOD EXTRACT, 1 and 2 grs.
These pills contain both the oil and resin existing in Sandal Wood, are believed to be superior to the oil alone, and are more convenient of administration.

IRON, DIALYZED, 2 grs.
Made from Merck's scales or plates of Dialyzed Iron, and about twenty times the strength of the solutions in market.

I have in stock every Gelatine-Coated Pill made by McK. & R.

T. H. SAYRE, Dispensing Chemist,
Sixth Avenue, cor. 46th Street, New York.

In corresponding with Advertisers please mention **The Medical Record.**

NOTICE.—See our Advertisement, page 3.

Extract of Malt

WITH

COD LIVER OIL.

Our Improved Extract of Malt with 50 per cent. of our fine Norwegian Oil, is pre-eminently THE emulsion of Cod Liver Oil, since it *has double the nutritive effect of any other emulsion of oil.* It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or gramineous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that IT UNITES PERFECTLY WITH WATER IN ANY PROPORTION, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

DOSE.—A Dessert to Tablespoonful immediately after Meals.

Prepared with the most scrupulous care

MATHIAS ROZSNYAY,

Arad, Hungary,

Begs leave to inform the Medical Profession that he has given his sole agency and the exclusive control of his preparation of

TASTELESS QUININE,

Neutral Tannate of Quinine,

To Mr. F. ALFRED REICHARDT, who keeps full stock of his preparations.

The discovery of Mr. Math. Rozsnyay to make an *absolutely tasteless and reliable* preparation of Quinine is one of the most important in modern therapeutics. The ordinary Tannate of Quinine, as made in chemical works, is obtained by precipitating the mother liquor, of which Quin. Sulphate has crystallized out, by an addition of Tannic Acid. First, this is an acid or bi-tannate, and contains likewise all the other Cinchorn Alkaloids, Quinidia, Cinchonidia, Cinchona, Quinidin, etc., the little intrinsic value of which is best proven by the price lists of large German manufacturers who quote this salt at only one-sixth of the value of the Sulphate. The *neutral* Tannate of Quinia has also great advantages over the Sulphate, as it does not cause the same cerebral and digestive troubles, as has been fully proved by the report of the commission appointed by the Academie de Medicine, in Paris, on a memoir presented by Mr. Bonestere. The commission consists of Messrs. Orfila, Bussy & Bouvier; their names are sufficient proof for the thoroughness of their researches.

I guarantee that this Neutral Tannate contains in 2½ grains the same percentage of pure Quinine as is contained in 1 grain of the Sulphate, and that its effects in equivalent doses are the same as that of the Sulphate. In treatment of diseases of children and persons of delicate taste, it is of the highest value. It is also put up in Chocolate Lozenges, containing each 2½ grs. of Tannate, 2 doz. in a box. Pamphlet sent free on application. Price per box, $1 00. Per ounce, $3 00.

FRANCIS J. GEIS,

Brewer and Maltster, Dobbs' Ferry, N. Y.,

PURE EXTRACT OF MALT.

Sole Agent for the U. S. and Canada, F. ALFRED REICHARDT.

This extract is absolutely pure and superior to **any other** make, foreign or domestic. Made without addition of hops, glucon, and guaranteed to be free from any substance whatsoever foreign to the best barley malt and distilled water. It is also the *cheapest* in the market. Put up in neat 1 lb. jars at 50c. per jar, or $3.75 per gallon, jar inclusive.

F. ALFRED REICHARDT,

Late Helmick, and Helmick & Co.,

Fluid Extract of Damiana.

The most effective preparation made under this name. It is a very efficient uterine tonic of the highest value in Impotency, Prostatitis, Spermatorrhœa, Suppressed Menses, and Catarrh of the Bladder. Its tonic action is as certain as that of Quinine. Put up in bottles of 6 oz. $2.00 per bottle. $16.00 per doz. Pamphlet sent gratis on application.

NITRITE OF AMYL PEARLS.

Made from Dr. E. Squibbs' Nitrite of Amyl. The only ones in the market of correct dosage. 2 and 3 drop, 75c. per doz. 5, 8 and 10 drop, $1.00 per doz.

IODOFORM, CRAYON'S.

Dr. Leblond's formula for Ulcerations of the Cervix. $1.00 per doz.

APIOL CAPSULES,

Absolutely pure. Containing 6 drops. The *only pure* of domestic make. $5.00 per 100.

BRUSH-HOLDING RUBBER STOPPLES.

90c. per doz.

F. ALFRED REICHARDT, Pharmacist and Importer, 404 Fourth Ave., N. Y.

BELLEVUE HOSPITAL MEDICAL COLLEGE,

CITY OF NEW YORK.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, JR., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DORSMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWIN L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

A FEW FACTS.

It is generally conceded, that, although the Drug Stores are usually well supplied with numerous styles of Enema Syringes, yet, it has heretofore been impossible for Physicians, or those requiring instruments of this kind, to obtain a really first-class Syringe; although exorbitant prices have been paid for several of the more prominent bulb Syringes, simply because the patents of certain manufacturers, were supposed to grant an entire monopoly, in the manufacture of this article.

When we consider the very just prejudice against lead pipes, for conveying or holding a liquid intended to be taken into the system, it seems strange, that an instrument so exceedingly useful as the Syringe, should have been heretofore made with Lead pipes and attachments; simply brushed over the polished surface, with a thin Alcoholic Varnish, or "*Laquer*," to prevent them from tarnishing, until sold or used. A prominent Physician recently remarked, "that he would as soon think of wearing artificial teeth made with lead or britannia plates, as to recommend a metallic Syringe subject to the same poisonous corrosion,"

Therefore we arrive at the fact, that a Syringe should not only be mechanically perfect in its construction and action, but the tubes and attachments, should certainly be made of either Gold, Hard Rubber, Platina or Nickel.

Dr. De Henrie's **"Gold Favorite"** and **Nickel Plated** Syringes, answer all these requirements.

A GOLD SYRINGE,

The constantly increasing favor with which the medical faculty and the public have received DR. DE HENRIE'S improved Nickel plated Syringes, has induced us to introduce a new and valuable novelty in Bulb Syringes to which the attention of physicians and the trade is respectfully solicited. "DE HENRIE'S GOLD FAVORITE" is certainly the most elegant syringe yet manufactured. The metal attachments are made of the purest white metal and nickel, heavily plated with 24 *carat gold*. This substantial plating extends throughout the inside of the tubes, and renders the syringe as pure and valuable for all practicable purposes as though the parts were solid gold. We wish it clearly understood that the "Gold Favorite" is not merely gilded, but substantially plated with pure gold, done in our own factory under the personal supervision of our Mr. Sutton. The rubber bulb and tubing is the finest made, and will not become hard or lose its elasticity, purity and durability being the object obtained.

The "Favorite Syringes," whether gold or nickel-plated are a decided improvement over those made with two elastic tubes extending from each end of the bulb, as the "Favorite" possesses all the merits claimed for a bulb held horizontally, while the valves work vertically which insures a perfect and easy action of the Syringe.

The rigid inlet pipe is conveniently held in the fluid to be injected; operating as a hand-rest, a great convenience to invalids.

De Henrie's "GOLD FAVORITE" Syringes are warranted perfect in every respect, and are justly entitled to rank as the *leading instrument*" among Syringes both in this country and abroad

The "GOLD FAVORITES" are all furnished in our patent polished walnut cases, lined with silk velvet, and are sold by leading druggists throughout the world.

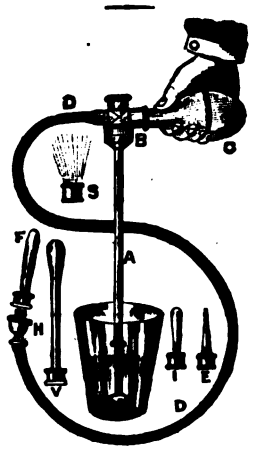
Wholesale price, $30,00 per dozen

Dr. De Henrie's Favorite Syringe.

Practical experience, and an earnest desire to overcome the many faults found in the construction and operation of the syringes heretofore sold, resulted in the invention of the "FAVORITE" which was introduced to the trade in April, 1877. It immediately became, as the name implies, a "Favorite" with the profession and the public, being ordered by the United States Government for use in the medical department of the United States army, and receiving the endorsement and praise of the highest medical authorities both here and in France, while the sales have been unprecedented This Syringe was introduced for favor entirely upon *its own merits*, and has achieved these results simply because of the following points of superiority. It possesses all the merits of a syringe with two elastic tubes—that of drawing liquid from a deep vessel, and the convenience of operating the bulb horizontally, while the *serious objections* to syringes of this style, such as the difficulty of keeping the rubber inlet-tube in the fluid (particularly when it becomes bent to the shape of the box), and the absence of a hand-rest making it fatiguing to pump with an extended hand, are all overcome in the FAVORITE, as the rigid suction pipe maintains a perpendicular position in the fluid, and can be easily handled, while it serves as a hand-rest, a comfort to ladies and feeble persons. As the outlet valve is located at the end of the elastic tube (*not at the bulb*), the fecalized fluids from the rectum are prevented from passing into the rubber tube, therefore it cannot become offensive. The valves work vertically, and are carefully fitted, so that every valve works snug and true, and are not liable to clog or get out of order. The bulb discharges the fluid in a direct line with the discharge pipe; being the only syringe having this valuable improvement of a bulb operating horizontally at right angles to the inlet tube, thus making it the easiest syringe known for an invalid to operate, never tiring the hand; while the old style, having the bulb standing upright on top of the suction pipe, must necessarily require more exertion, as the fluid is pressed against the valve and forced around an acute angle, requiring strength to operate it. One trial of De Henrie's Syringe is convincing that it is the best to recommend to an invalid or to ladies.

De Henrie's Favorite is elegantly NICKEL PLATED; making the metallic parts pure as glass for use. Each syringe is packed in a handsome polished walnut case, fitted with compartments for each part. As a syringe for family use it has no equal, being composed of tubes for the injection of male adult, female vagina, children, eye, ear, and a spray for inflamed surfaces. Wholesale price, $12.00 per dozen.

Explanation of Dr. De Henrie's Improved Favorite Syringe.



A—Suction Pipe, with Valve at **B**. **C**—Rubber Bulb, connects with **A** at **B**. **D**—Flexible Tube of the Finest Rubber. **H**—Outlet Valve Chamber. **F**—Injection Tube for Bowels of Adults or Children. **V**—Vaginal or Female Tube. **I**—Infant Tube, **E**—Ear Tube. **S**—Spray Cap for the Eye or inflamed Surface.

All enclosed in elegant, polished Walnut Boxes fitted with our patent compartments for keeping the tubes in place, and prevent them from rattling when carried.

The metalic parts are thickly plated with Gold or pure Nickel. The Rubber Bulb and Tubing is the *finest made*. The action is easy, and the valves fit perfectly, therefore the Syringe injects no air.

THE DE HENRIE SIPHON.

P, Spiral Coil, prevents the rubber tube from slipping out of the vessel; **B**, small rubber bulb, one compression starts the flow; **S**, improved stop cock; **F**, male tube; **V**, Vagina or Female Tube; **E**, Ear Tube; **N**, Nasal Douche; **A** Spray for inflamed surfaces.

This already famous Syringe is conceded by physicians to be the most convenient and useful article yet introduced; our cut is a fair illustration of its actual merits.

It acts automatically, dispensing with the pumping attendant upon the use of Bulb Syringes, and is designed as a decided improvement on the well-known water bag or "Fountain Syringe." In this Syringe we dispense with the rubber bag, which is so liable to crack or become leaky, and instead we use any convenient vessel for holding the liquid to be injected, simply placing the vessel upon the washstand bureau or mantel or suspended above the head, for injecting any quantity of fluid, from an ounce upward. A single compression of the small bulb **B** (see cut) starts the flow which continues whenever the stop-cock **S** is open. The hydrostatic pressure is invariably sufficient for vaginal or ordinary injections of the rectum or bowels, or a slight compression of the bulb increases the force when necessary to remove hardened feces from the rectum. As a nasal douche it has no equal. Each syringe complete with tube for male, female and infant, ear, nasal tube, and sprinkler. The metalic parts are manufactured of the purest white Britannia, nickel plated, all enclosed in a polished patent walnut case.

Wholesale Price, $15 per dozen.

Complete Price List of De Henrie's Syringes.

De Henrie's Gold Favorite (patent velvet case).....$30.00 per dozen.
De Henrie's Nickel Favorite (patent walnut case).....$12 00 per dozen.

The Thirty-first Session of Starling Medical College will commence October 4, 1877, and continue until March, 1878. It will be preceded by a preliminary course beginning September 1, 1877. Extensive additions have recently been made to the Museum and other teaching facilities of the College.

Francis Carter, M.D., Emeritus Professor of Obstetrics and Diseases of Women and Children, and Dean of the Faculty.
H. G. Landis, A.M., M.D., Professor of Obstetrics.
Sam'l D. Turney, M.D., Professor of Diseases of Women and Children.
Theo. G. Wormley, M.D., LL.D., Ph.D., Professor of Chemistry.
James H. Pooley, M.D., Professor of Surgery.
Starling Loving, M.D., Professor of Practice of Medicine.
John M. Wheaton, M.D., Professor of Anatomy.
B. B. Fullerton, M.D., Professor of Materia Medica and Therapeutics.
W. J. Conklin, M.D. (of Dayton), Professor of Physiology.
W. J. Wolfley, M.D., Professor of Opthalmology and Otology.
Alex. Dunlap, M.D., Professor of Surgical Diseases of Women.
Hon. J. W. Baldwin, M.A., Professor of Medical Jurisprudence.
D. A. Morse, M.D., Professor of Nervous Diseases and Insanity.
Otto Frankenberg, M.D., Professor of Pathology.
T. C. Hoover, Prosector to the Chair of Surgery, Lecturer on Minor Surgery and Demonstrator of Anatomy.

College, corner of State and Sixth Sts.; Dean's Office, 181 East State St.; Secretary's Office, 72 East Gay St.

Letters of inquiry should be addressed to the Dean,
PROF. FRANCIS CARTER, M.D., Dean, Columbus, Ohio.

UNIVERSITY OF MICHIGAN.
DEPARTMENT OF MEDICINE AND SURGERY.

The 29th annual course of lectures will commence on Oct. 1, 1878, and continue *nine months*.

Course separate but equal for women.

Matriculation Fee, *paid but once*—Residents of Michigan, $10; non-residents, $25.

Annual Dues—Residents of Michigan, $20; non-residents, $25.

Graduation Fee—For all alike, $10.

Send for Circular and Catalogue.

A. B. PALMER, M.D., DEAN, Ann Arbor, Mich.

IOWA STATE UNIVERSITY.
IOWA CITY, IOWA.
MEDICAL DEPARTMENT.—SESSION OF 1877-'78.

The next regular course will commence on Wednesday, October 24th, 1877, and continue until the first Wednesday in March, 1878. The preliminary term will begin on Wednesday, October 10th, and continue until the opening of the regular course. Clinical instruction in Mercy Hospital gratuitous. Advanced students will be intrusted with the care of cases. Applicants for graduation will be required to perform operations upon the cadaver. An abundant supply of dissecting material constantly on hand.

FEES.—For the entire Course, $20.00. Matriculation Ticket, $5.00. Demonstrator's Ticket, $5.00. Graduation Fee, $25.00. For further information, address W. F. PECK, M.D., Dean, Davenport, Iowa,
Or, ELMER F. CLAPP, M.D., Sec'y, Iowa City, Iowa.

N. H. MEDICAL INSTITUTION AT
DARTMOUTH COLLEGE.

The *Eighty-second* Annual Course of Lectures begins Aug. 1, 1878, and continues fourteen weeks. Recitations from Dec. 5 to June 20.

FACULTY:—E. E. Phelps, M.D., LL.D., Practice Emeritus; O. P. Hubbard, M.D., LL.D., Chemistry; J. Ordronaux, M.D., LL.D., Medical Jurisprudence; C. P. Frost, M.D., Practice; P. S. Conner, M.D., Surgery; E. S. Dunster, M.D., Gynecology and Obstetrics; H. M. Field, M.D., Therapeutics; L. B. How, M.D., Anatomy and Physiology.

FEES:—Matriculation, $5; Lectures, $77; Graduation, $25; Recitations, $40.

For Circular, address C. P. FROST, M.D., Dean, Hanover, N. H.

MEDICAL DEPARTMENT OF
HARVARD UNIVERSITY,
BOSTON, MASS.
NINETY-FIFTH ANNUAL ANNOUNCEMENT. (1878-79.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 26th, 1878, and ends the last Wednesday in June, 1879. Persons who hold no degree in arts or science must pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 23d.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing
DR. R. H. FITZ, Secretary, 108 Rowlston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins February 14, and closes June 25, 1878.

Winter Term begins October 3, 1878; closes January 30, 1879.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address
CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing
H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar.
WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES
Will commence on Tuesday, October 2, 1877, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one block* of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

WM. H. BYFORD, A.M., M.D., President.
T. D. FITCH, M.D., 296 West Monroe St., Secretary.
CHAS. W. EARLE, M.D., 37 Park Ave., Treasurer.

Official Announcements of the Medical Colleges of the U. S.

The Fourteenth Annual Course of Lectures in the

Medical Department of the University of Wooster,

LOCATED AT CLEVELAND, OHIO,

Will begin Wednesday, October 3d, 1877, and continue until the last Wednesday in February, 1878. Medical and Surgical Clinics, Monday and Tuesday, Thursday and Friday of each Week, at Charity Hospital. The Preliminary Term commences Sept. 19. The Summer Course of Recitations and Clinics begins April 2, 1877, and continues 12 weeks.

FACULTY.—G. C. E. WEBER, M.D., Dean; L. FIRESTONE, M.D., LL.D.; W. J. SCOTT, M.D.; H. J. HERRICK, M.D.; CONWAY NOBLE, Esq.; A. C. MILLER, M.D.; JOEL POMERENE, M.D.; D. B. SMITH, M.D.; H. W. KITCHEN, M.D.; T. CLARK MILLER, M.D.; JOHN H. LOWMAN, M.D.; G. T. GENTSCH, P.C. For Circular and Catalogue, address H. W. KITCHEN, Sec'y, No. 3 Euclid Avenue, Cleveland, O.

CLEVELAND MEDICAL COLLEGE,

Cor. St. Clair and Erie Sts. Founded 1843.

FACULTY:—JARED P. KIRTLAND, M.D., LL.D.; J. L. CASSELS, M.D., LL.D.; PROCTOR THAYER, M.D.; JOHN BENNITT, M.D., Dean; JACOB LAISY, M.D.; JOHN E. DARBY, M.D.; E. W. MORLEY, M.A.; FRANK WELLS, M.D.; ISAAC N. HIMES, M.D.; X. C. SCOTT, M.D.; B. W. HOLLIDAY, M.D.; N. P. SACKRIDER, M.D.; LEWIS BUFFETT, M.D.; H. H. POWELL, M.D.; WILLIAM WALLACE HOLLIDAY, M.D.

FEES.—Lecture Tickets, including Matriculation and Demonstrator's Ticket, $50. WINTER SESSION.—Commences on the third Wednesday in September, and continues 24 weeks. SUMMER SESSION.—Commences on the first Monday in April.

Medical School of Maine,

AT BOWDOIN COLLEGE.

Fifty-Eighth Annual Course of Lectures for 1878 will commence February 14, and continue sixteen weeks.

FEES.—Matriculation (payable each term), $5.00. Full Course (in advance), $75.00.

ALFRED MITCHELL, M.D., Secretary, BRUNSWICK, Me.

Woman's Medical College of Pennsylvania.

THE TWENTY-EIGHTH WINTER SESSION

Will open on Thursday, October 4, 1877, in the commodious new College Building. Clinical instruction is given in the WOMAN'S HOSPITAL, Pennsylvania, *Wills, Philadelphia* and *Orthopædic Hospitals*. *Spring Course* of Lectures, Practical Demonstrations, and *Winter Quizzes* are free (except for expense of material) to all Matriculants of the year.

Address

RACHEL L. BODLEY, A.M., *Dean*, North College Ave. and 21st Street, Philadelphia, Pa.

WANTED.

ALEXANDER J. C. SKENE, M.D., Professor Diseases of Women and Children.
EDWARD SEAMAN BUNKER, M.D., Professor of Obstetrics.
CORYDON L. FORD, M.D., Professor of Anatomy.
JARVIS S. WIGHT, M.D., Professor of Surgery, and Registrar.
JOHN D. RUSHMORE, M.D., Professor of Materia Medica.

THE CLINICAL ADVANTAGES OF THE LONG ISLAND COLLEGE HOSPITAL ARE UNSURPASSED IN THIS COUNTRY.
For circulars, address DEAN or REGISTRAR.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating, it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia, Magnesia and Bi Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature, if prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*
Pints, 4 dozen in a case $9 00
Quarts, 2 dozen in a case 7 00

In Saratoga. *Delivered at the Cars.*
Pints, 4 dozen in a case $8 00
Quarts, 2 dozen in a case 6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York**, will receive prompt attention.

THE NEW MODEL PHYSICIAN'S MICROSCOPE,

Manufactured by the BAUSCH & LOMB OPTICAL CO.,

Under the direct supervision of MR. GUNDLACH.

While elegant in design, it is low and compact, a great advantage for medical and histological purposes. The Stage is large and firm, resting on two strong brass arms. The mirror has a very wide range of motion for oblique light, and may be brought above the Stage for the illumination of opaque objects. There is a Sub-Stage, with Diaphragms, which may be placed close to the object or at some distance below it, as the microscopist may wish. Draw tube for increasing power.

The Coarse Adjustment is by rack and pinion, of the best workmanship, and the Fine Movement is by Mr. Gundlach's new device, which has given universal satisfaction.

The Optical Part is of the best quality, and has been specially designed for histological and medical purposes. There are two Eye-pieces, A and C; two Objectives, 3-4 and 1-5, giving eight magnifying powers, ranging from 50 to 375 diameters—sufficient for all ordinary work. There is also a Camera Lucida for drawing, and an eye-piece micrometer with scale and rules for accurate measurement.

PRICE, in Neat Black Walnut Case, with Drawer for Accessories, Lock, Key and Handle, $60.00.

INDUSTRIAL PUB. CO., 176 Broadway, N. Y

UNIVERSITY OF THE CITY OF NEW YORK.

MEDICAL DEPARTMENT.

410 East Twenty-sixth St., opposite Bellevue Hospital, New York City.

THIRTY-SIXTH SESSION.—1877-78.

Demonstrator of Anatomy.

POST-GRADUATE FACULTY.

D. B. ST. JOHN ROOSA, M.D.,
Professor of Ophthalmology.
WM. A. HAMMOND, M.D.,
Professor of Diseases of the Mind and Nervous System.
STEPHEN SMITH, M.D.,
Professor of Orthopædic Surgery.
J. W. S. GOULEY, M.D.,
Professor of Diseases of the Genito-Urinary System.

MONTROSE A. PALLEN, M.D.,
Professor of Gynæcology.
HENRY G. PIFFARD, M.D.,
Professor of Dermatology.
A. E. MACDONALD, M.D.,
Professor of Medical Jurisprudence.
JOSEPH W. HOWE, M.D.,
Clinical Professor of Surgery.

THE COLLEGIATE YEAR is divided into three Sessions: A Preliminary Session, a Regular Winter Session, and a Spring Session.

THE PRELIMINARY SESSION will commence September 19, 1877, and will continue until the opening of the Regular Winter Session. It will be conducted on the plan of that Session.

THE REGULAR WINTER SESSION will commence on the Third of October, 1877, and end about the 1st of March, 1878.

The location of the new College edifice being immediately opposite the gate of Bellevue Hospital, and a few steps from the ferry to Charity Hospital, Blackwell's Island, the Students of the University Medical College are enabled to enjoy the advantages afforded by these Hospitals, with the least possible loss of time. The Professors of the practical Chairs are connected with the Hospitals, and the University Students are admitted to *all the Clinics* given therein, *free of charge*.

In addition to the daily Hospital Clinics, there are eight Clinics each week in the College building. Five Didactic Lectures will be given daily in the College building, and Evening Recitations will be conducted by the Professors of Chemistry, Practice, Anatomy, Materia Medica, &c., Physiology, Surgery and Obstetrics, upon the subjects of their Lectures.

THE SPRING SESSION embraces a period of twelve weeks, beginning in the first week of March and ending the last week of May. The daily Clinics, Recitations and Special Practical Courses will be the same as in the Winter Session, and there will be Lectures on Special Subjects by the Members of the Post-Graduate Faculty.

THE DISSECTING ROOM is open throughout the entire Collegiate year; material is abundant, and it is furnished free of charge.

STUDENTS WHO HAVE STUDIED TWO YEARS may be admitted to examination in Chemistry, Anatomy and Physiology, and if successful, will be examined at the expiration of their full course of study, on Practice, Materia Medica and Therapeutics, Surgery and Obstetrics; but those who prefer it may have all their examinations at the close of their full term.

FEES.

For Course of Lectures	$140 00
Matriculation	5 00
Demonstrator's fee, including material for dissection	10 00
Graduation Fee	30 00
Post-Graduate Certificate	30 00

For further particulars and circulars, address the Dean,

Prof. CHAS. INSLEE PARDEE, M.D.,

University Medical College, 410 East 26th St., New York City.

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses.

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

A. J. DITMAN, Druggist, cor. Broadway and Barclay St., New York.

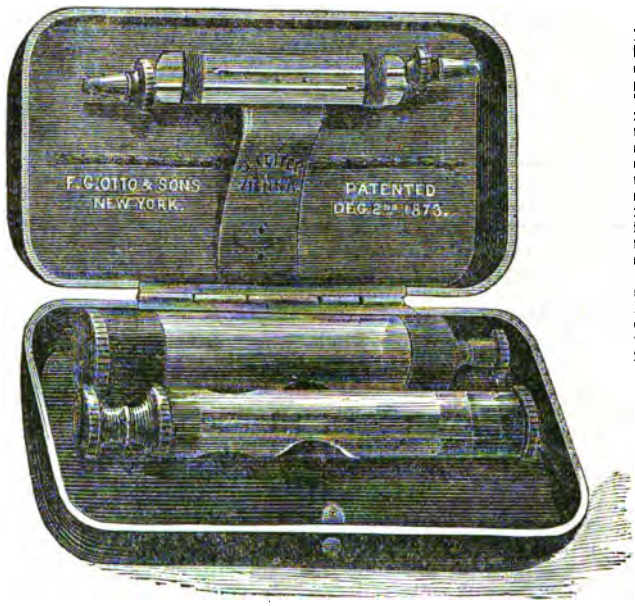
LEITER'S HYPODERMIC SYRINGE

MANUFACTURED AND PATENTED BY

F. G. OTTO & SONS,

Manufacturers and Importers of Surgical Instruments, Druggists' Sundries, &c.,

64 Chatham Street, New York.



The construction of this Syringe is as simple as it is novel. It consists of a glass cylinder, which is ground conic on the inside of each end; into these sockets fit two hard rubber cones *a* and *b*, Fig. 1. To facilitate the holding of the syringe the glass is ground in the manner shown at *C* and *D* in Fig. 1. The upper hard rubber fitting *a* is for the reception of the needle which is provided with a cone as shown at *D* in Fig. 2, the lower fitting *B*, Fig. 1, receives the piston-rod, which is also made of hard rubber. The glass cylinder being ground conic (making the opening larger at the extreme ends) makes the introduction of the piston very easy, after being taken apart for cleaning or lubricating. Having made considerable improvements in the manner of filling the syringe, as well as in the needles, we feel justified in saying that this syringe is far superior to any yet brought before the profession. The syringe is filled in a very simple manner.

Fig. 3 shows the vial. *B* in Fig. 3 is a cone which fits the socket in fitting *a*, Fig. 1, after having introduced cone *B*, Fig. 3, into fitting *A*, Fig. 1, unscrew the fitting *C* in Fig. 3, draw down the piston and the syringe will fill readily and without a chance for air coming into the same. *A* in Fig. 3 is a cap to close the vial.

To fill the vial unscrew the fitting *C*, Fig. 3, entirely.

The Advantages of this Syringe are:

1st—It has no metal to corrode, the only metal present being on the needle which, if wire is introduced after using, is easily kept open.

2d—The easy manner in which the Syringe may be taken apart for cleaning and lubricating.

3d—The manner of filling the Syringe.

The Syringe before described has been adopted by the ***Medical Department of the United States Army.***

FOOD for INFANTS and INVALIDS.

ANTILLANA.

An unmixed product from a tropical species of Canna. A light and nourishing food for Children and Invalids. Particularly adapted to Infants artificially fed, to dyspeptics and persons of weak digestion.

Pleasant to the eye and agreeable to the taste. For nursing mothers with a deficiency of milk, a bowlful taken before retiring at night will so effectually increase the secretion of milk as to save from the exhaustion consequent on the child's night nursing.

DIRECTIONS FOR USE.—As a plain food for Children and for Nursing Mothers, take a teaspoonful of the Antillana, mix into a paste with cold water, then pour over it a cupful of boiling water or boiling milk (or half milk and half water), allow it to boil for a few seconds only, and sweeten to taste. This will produce a cupful of thick, nourishing and palatable food. *See wrappers for further directions.*

Proprietor, JAMES ELMSLIE, 137 Duane Street, New York City.

DELLUC'S BISCOTINE FOR INFANTS AND INVALIDS.

This excellent and healthy substance is prepared from a sweetened bread and other nutritious substances, reduced to a fine powder, so as to render them easily soluble in water or milk.

A similar preparation is known in France, under the name of **Biscottes** Food for Infants and Invalids.

As an article of common diet for infants, particularly those suffering from delicate constitutions, weak intestines, or looseness of the bowels, it will be found to give health and strength with more certainty than the **Crude** substances now in use, and not like them, liable to sour on the stomach.

DELLUC & CO., 635 Broadway, New York.

Tins, 1/-, 2/-, 5/-, 10/-

AS SUPPLIED TO

THE ROYAL NURSERIES

of England, Russia, Etc.,

NEAVE'S FOOD

FOR

INFANTS

AND

INVALIDS,

Is pre-eminently rich in albumenoids and phosphates, and the starch which it contains is in a state readily assimilated by the infantile digestion.

NEAVE'S FOOD has received the high and unqualified approval of eminent medical men for many years past. It usually commands a ready sale, both in Great Britain and in the States, for it is strongly recommended by mothers to the notice of their lady friends; and infants often give it a preference, refusing other foods. As a natural result, the sale has extended rapidly, especially during the past four years, necessitating the erection of extensive premises, again enlarged in December, 1876, where the preparation is carried on under the personal supervision of Mr. Neave.

NEAVE'S FOOD is sent in large quantities to the Colonies and to the United States. It is prepared with special reference to exportation.

NEAVE'S FOOD is sold in tins and tinfoil packets by chemists and storekeepers at home and abroad.

For terms, apply to any wholesale or export house, or to manufacturers,

JOSIAH R. NEAVE & CO., Fordingbridge, England.

☞ Doctors and Medical Practitioners wishing to try Neave's Food are requested to apply for a Sample Packet (gratis) at the undermentioned Agency.

AGENT FOR THE STATES,

J. O. NOXON, 444 Fulton Street, Brooklyn, N. Y.

In corresponding with Advertisers please mention THE MEDICAL RECORD

FOOD for INFANTS and INVALIDS.

BLAIR'S
PREPARED WHEAT FOOD,

A Nutritious Diet for Infants.

Contains more of the nitrate and phosphates (muscles and bone forming element) than most farinaceous foods. Price low and sells well; guaranteed to keep.

HENRY C. BLAIR'S SONS,
Eighth and Walnut Streets,
PHILADELPHIA.

Lœfund's Concentrated Liebig's Food for Infants (Liebig's Soup for infants in a concentrated form), **ready for use**, has been pronounced by the Judges of the Centennial Exhibition: **A Perfect Substitute for Mother's Milk**, and therefore awarded a prize. Price, 75 cents per bottle.

Circulars given full particulars will be mailed to all parts upon application.

Caution to the Trade and Public.—The labels on Lœfund's Preparations should be carefully examined. The signature of ED. LŒFLUND appears on the right lower corner of the genuine label; in the centre, the *Trade Mark*; and on the *left lower corner*, the words: Sole Agent for America, ALBERT C. DUNG, Druggist, 61 Bowery, N.Y.

The K. & M.
INFANTS' FOOD

Perfectly free from Starch and perfectly soluble.

CONTAINS NO ALCOHOL.

An extract prepared from malted grain, consisting of grape sugar, dextrine, alkaline phosphates, etc.

"A child deprived of its mother's milk, can only be fed properly when the food is equivalent in power to woman's milk."—BARON LIEBIG.

DIRECTIONS FOR USE.—Dissolve a tablespoonful of this extract in one-third of a pint of fresh, warm cow's milk, by simply stirring it. This being double the strength of mother's milk, it should be diluted with an equal quantity of warm water, until the infant is some months old.

Prepared with the most scrupulous care by

KEASBEY & MATTISON, Manufacturing Chemists.
332 N. Front St., Philadelphia, Pa.

NESTLÉ'S MILK FOOD,
Or LACTEOUS FARINA,

Contains all the elements of a complete nutrition in the most assimilable state FOR INFANTS FROM THE FIRST WEEK OF THEIR LIFE. It is also an excellent Food for debilitated adults.

CONSTITUENTS COMPARED with WOMAN'S MILK.

1,000 parts of woman's milk contain		1,000 parts of milk food contain:	
Water, - - -	873.80	Water, - - -	49.40
Organic Substances, -	124.40	Organic Substances, -	931.10
Ashes, - - -	1.80	Ashes, - - -	19.50
	1,000.		1,000.
Nitrogen, - -	4.83	Nitrogen, - -	21.40

The ashes of the MILK FOOD are the same as woman's milk, and consist of *(Bases)* Lime, Potash, Soda, Magnesia, Oxide of Iron, Alumina (Traces); *(Acids)*, Phosphoric (2.15 in 1,000 parts), Sulphuric, Hydrochloric, Lactic (traces).

Mixed with nearly four times its weight of water, it forms a fluid containing as much Azote as woman's milk; and with two parts it forms a pap twice as nourishing.

For infants it is generally diluted with 10 or 5 measures of water, as directed on the box.

The MILK FOOD, extolled throughout Europe, is largely used at the Nursery and Child's Hospital of New York, and most of the hospitals of the United States. It is highly recommended by all the physicians whose attention has been called to it.

The following Physicians are referred to by special permission:
Isaac E. Taylor, John T. Metcalfe, Joseph J. Hull, Robert F. Weir, J. Lewis Smith, Edward J. Dunster, James B. Reynolds, Wm. H. Maxwell, New York; Theo. R. Varick, Jersey City; Wm. K. Brown, Thos. McAllister, H. J. Garrigues, Brooklyn; William B. Atkinson, F. F. Maury, J. A. Meigs, F. G. Smith, E. A. Spooner, Philadelphia.

Retailed 60c. per Box. Cheaper than cow's milk.

Liberal Discount to the Trade and Charitable Institutions.

CAUTION.—Physicians are particularly warned to beware of numerous counterfeits and imitations of so-called Lacteous Farinas, and to *refuse all boxes not bearing Nestlé's name as well as that of*

H. ASTIÉ, Sole Agent,
15 South William Street, NEW YORK.

THERE IS NO DOUBT

That thousands of children die from deficient or improper nourishment, and Mothers and Nurses should see to it that the infant constitution is built up and strengthened by proper food before the trying

SUMMER MONTHS

come, which are the most dangerous to infant life. For this emergency

RIDGE'S FOOD INFANTS INVALIDS

has the indorsement of the Matrons and Physicians of the principal Infant Asylums and Lying-in Hospitals in the United States, and Physicians of all schools have given it their unqualified approval as a HIGHLY NUTRITIOUS and easily assimilated food, and *especially adapted for Infants and growing children.*

RIDGE'S FOOD INFANTS INVALIDS

is also specially adapted to adults suffering from weakness of the digestive organs, and, therefore, those afflicted with any symptoms of INDIGESTION will find, on trial, it has all the qualities that have been claimed for it, and all that they can desire in the way of nutrition and strength.

Put up in four sizes, with

WOOLRICH & CO., on every label.

SUPERIOR NUTRITION THE LIFE.

IMPERIAL GRANUM.

THE INVENTION OF AN EMINENT FRENCH CHEMIST.

To Physicians and the Public:

This preparation is, in composition, as advertised, principally the Gluten derived, by chemical process, from *very superior growths of wheat*, and should not be confounded with burnt or boiled Flour, in which the Gluten or sanative qualities are destroyed or made medicinally inert, nor with Crushed Wheat, or finely ground Wheaten Grits, styled "Medicinal Food," and sold under various names, in which the starch and impurities contained in wheat are retained in larger quantity.

By Dubisson's formula, the starch, impurities and soluble matter found in the Wheat Cereal are effectually excluded; the Gluten only retained, which is condensed, granulated and prepared to keep in all climates, and justly entitled

IMPERIAL GRANUM.

It is well known, and should be fairly considered, that nothing of merit can b *favorably received and commended by the public without being followed by* imitations of a questionable character. IMPERIAL GRANUM *is not the exception, for no* preparation *has* attracted more attention, *nor been more fiercely imitated, by competition*, even to wording and shipping order.

Whilst again it can be truly said that no preparation ever offered for sale has been more carefully prepared and thoroughly tested, nor has met with a more welcome reception and universal approval, or afforded more relief to invalids or to young and suffering children and aged persons. This has been confirmed by thousands of testimonials from Chemists, Physicians, Heads of Families and the Press.

Respectfully,
E. HEATON,
General Agent for the United States.

SOLD BY **DRUGGISTS,** IN AND **PHARMACISTS,** THE

PRINCIPAL CITIES OF THE UNITED STATES.

JOHN CARLE & SONS, NEW YORK.

Strychnia	1-60, 1-40, 1-30 gr.
Sulphur, Iodide	1-25, 1-10 gr.
Tartar Emetic	1-100, 1-20, 1-4 gr.
Zinc, Phosphide	1-6, 1-4, 1-2 gr.

Physicians have experienced the need of a reliable and pleasant form for administering these more potent remedies. The want of reliability, as exhibited in the granules of the market by the varying action following their administration, has caused them to be avoided—and very justly—by most practitioners, who have preferred rather to use solutions, and trust to the custom of dropping, or using a teaspoon to measure their portions, although nearly as uncertain, owing to great difference in the sizes of teaspoons; and the fact that drops vary with the conditions and form of surface, from which they flow.

In our preparations we have taken special precautions by enforcing our system of checking the weights, and, at large expense, have had our machines for division of the substances so carefully and correctly constructed, as to insure an exactness never before maintained in this class of preparations. We can, therefore, afford assurance to physicians of correct weight and perfect division. Our granules have been appreciated and are being extensively used by the profession.

Be careful and see that "McKesson & Robbins" is on the label, and specify McK. & R. on prescriptions.

Full lists furnished upon application to

McKESSON & ROBBINS, 91 Fulton Street, New York.

Quote MEDICAL RECORD.

BEDFORD (VA.) SPRINGS WATER & MASS.

Standard Natural Remedies endorsed by Medical profession for Throat, Skin, Stomach, Blood and Uterine Diseases. Efficiency attested by results in thousands of cases during the last 25 years. Full proof, with analysis and directions, sent with each package. Prices: Water, $4.00 case; Mass, $1.00 package, or $10.00 a dozen. Liberal terms to the trade. Special rates to physicians. CARNIER, LAMOUREUX & CIE.,

213 RUE ST. HONORÉ, PARIS,

Beg leave to inform the profession that Mr. F. ALFRED REICHARDT, 404 Fourth Avenue, N. Y., is their Sole Agent, and keeps a full stock of their Sugar-Coated Pills and other goods on hand.

Referring to above, I beg leave to call the attention of the profession to the goods made by Messrs G., L. & Co., of Paris. They are the first house which made Sugar-Coated Pills a specialty, and their goods were introduced twenty-five years ago into the United States. Their goods are superior in finish and quality to any other made. They use no coating between pill mass and sugar, and all their pill masses are easily soluble. **Their list prices to physicians are lower than other makers,** and their goods more reliable.

The latest additions to their list are: Dragees of Crystal; Valerianate of Ammonia, without taste or smell, 2 grains; Citrate of Coffein, ½ grain; Monobromide of Camphor, 2½ grains; Codeia, 1-8 grain; Crotors Chloral (Liebreich's), 2½ grains; Cynoglosse or Pil. Nepenthe; Diascordium: Extract Eucalyptus, 2½ grains; Malate or Pomate of Iron; do., with ¼ grain Extr. Nux Vomica; Extr. Gilsemium; Drag. Meglin; Quin. and Ferri Citras, (20% Quins.) 2 grains; Tonic Aperient; also the already well-known Granil Proto-Iodide Mercury, 1-5 grain, and Dr. Francis' Triplex Pills.

Goods sent free by mail on receipt of list price. Please send for Price List and Descriptive Pamphlet, mailed free on application.

F. ALFRED REICHARDT, Pharmacist and Importer, 404 Fourth Avenue.

Original Lectures.

LECTURES ON TYPHOID FEVER.

By ALONZO CLARK, M.D.,

PROFESSOR OF PATHOLOGY AND PRACTICAL MEDICINE IN THE COLLEGE OF PHYSICIANS AND SURGEONS IN THE CITY OF NEW YORK.

(Reported for THE MEDICAL RECORD.)

TYPHOID FEVER—SYNONYMS—MODES OF PROPAGATION—LESIONS—SYMPTOMS.

LECTURE I.

GENTLEMEN:—Our next topic is typhoid fever. This is the indigenous fever of New England and of this country, except where miasmatic fevers prevail. The disease in various places, and by various authors, has received the following names:—Louis called it "The Typhoid Affection." It has also been called "Abdominal Fever," "Abdominal Typhus," "Enteric Fever," "Ileo-typhus," "Entero-mesenteric Fever," "Nervous Fever," "Autumnal Fever," "Continued Fever," "Pythogenic Fever," "Infantile Remittent Fever," and what has been called "Gastric Fever" is this same disease.

MODES OF PROPAGATION.

This disease occurs epidemically or sporadically. It is very common to hear that there is an epidemic of typhoid fever prevailing in some town not far away during the autumn or latter part of summer, and the epidemic commonly continues until cold weather arrives, with an occasional case during the winter.

It is certainly communicable, in one way or another, from one person to another. I could give a large number of illustrations of this fact. Typhoid fever was prevailing in the town of Plymouth. A boy came from Plymouth to Mr. B.'s house, fourteen miles distant, and was there taken sick with typhoid fever. The disease ran its course in about four weeks, but before the boy began to recover, Mr. B., Mrs. B., and their children were taken sick with the same disease. There had been no typhoid fever in the locality in which B. lived for several years. In this manner it spread through a school-district. Nearly all the persons who spent much time in this infected house, assisted in washing the clothes and in taking care of the patients, had the disease. Those who visited the sick by day did not contract it so frequently as those who took care of them at night. About twenty-five persons were attacked in this school-district, and then its spread ceased.

Typhoid fever was prevailing in the town of Richmond. A boy who had been living there, and in a house where the family was afflicted with it, went to his father's house in Canaan, New York. He was taken sick in his father's house with a disease that had exactly the same history as that prevailing in the town of Richmond. There had been no typhoid fever in Canaan for several years, and now a little epidemic spread through the town. I could cite many other instances in which the disease has been carried by a well person from one town to another—illustrations, not of the contagiousness of the disease, but of its communicability perhaps, by the intestinal discharges.

That typhus fever is communicated by the effluvia arising from the sick person I entertain no doubt; but I do entertain a doubt whether typhoid fever is communicated in the same manner.

I will now call your attention to other modes in which this disease seems to be propagated.

I have here a memorandum with reference to propagation of typhoid fever through the medium of milk.

The Medical Inspector of Leeds, England, traced the cause of an epidemic of typhoid fever that broke out in that city to the milk, which, for a certain locality in the city, was obtained at a country farm-house, where a patient was sick with typhoid fever.

Dr. Littlejohn, Medical Inspector of Edinburgh, reports in September, 1877, the occurrence of several cases of typhoid fever in the West End, and believes that they were caused by milk sold from a dairy where a person was sick with the disease.

"At the present time," he says, "over twenty families are suffering severely from the disease, and several cases have terminated fatally."

The next memorandum relates to the clothes of the sick person. Prof. Lebert, of Breslau, reports four cases of typhoid fever occurring among women employed to wash the clothes used by patients sick in the hospital with that disease. He thinks they were probably the victims of carelessness, but I should say really of ignorance. These women lived in different sections of the city.

Here is another memorandum relating to the transmission of the poison by running water:

A miller in Scotland had typhoid fever; his excreta were thrown into a pond which communicated, by means of a ditch, with a small stream below, the water of which was used for drinking by those living along the border. The discharges from a second patient sick with the same fever were thrown into the same pond. A few days after, four men who obtained water from the stream a mile below were attacked with the same disease. There had been no case of typhoid fever in this region for a long time.

In the town where I have my summer home there was obtained the history of an occurrence which is very striking. Twenty young persons went upon a pic-nic excursion. They took their refreshments by the side of a clean, bright-looking stream, and drank of its water. In due time eighteen of these persons were attacked with what was called typhoid fever; several died. The question, where did the poison come from? is one of a good deal of interest. That it did not come from the provision baskets seems certain, because there was no typhoid fever in the town. To my mind, there is but little doubt that it came from the stream; and yet it is not known that a typhoid-fever patient lived upon the stream, or that the excreta of a person sick with typhoid fever were emptied into it. It is altogether likely, however, that privy washings in some way had a communication with the stream; or it may have been that a case of unrecognized typhoid fever occurred at some point along its course, and that the excretions of the patient were thrown into it.

The question whether the excretions from healthy persons can produce typhoid fever, when thrown into a stream in this manner, is not fully settled. But it seems to be improbable.

At Bellevue Hospital, however, it has been occasionally reported, particularly during the dry weather of summer, that a case of typhoid fever has occurred in the wards. I no sooner hear this statement than I make an inspection of the water-closet, and have not yet failed to find that it was exceedingly foul, and that, because of the exhaustion of the reservoir of water with which it is washed out, the basins have been used without cleaning. Now, whether this is what has been called cess-pool fever, or whether it is typhoid

fever, is not, as yet, easy to determine, for observations sufficiently extensive have not been made.

Some years ago a disease broke out in a large school for girls, at Pittsfield, Mass. Dr. Palmer, of Ann Arbor, Mich., and Drs. Ford and Greene, of Pittsfield, after making a pretty thorough examination of the question, reported that they had no doubt that the disease was typhoid fever, and also had no doubt that it arose from foul sewers connected with the building. There was a blind sewer of considerable size, into which the washings of the water-closets were emptied, and the accumulation had become so considerable that it had set back sufficiently to contaminate the entire building with its foul exhalations. No person sick with typhoid fever had been in the institution previous to this outbreak.

In my own mind the question is a little unsettled, whether the excretions from healthy persons can produce typhoid fever. My impression, however, is that, when these cases are closely examined in the new light, they will be found to be what is described as cess-pool fever.

In the volume of Transactions of the Medical Society of the State of New York, for the year 1877, Dr. Stoddard, of Rochester, makes a report bearing upon the possible diffusion of typhoid fever which is of much importance.

The reporter says that "a certain limited section in the city of Rochester was invaded by typhoid fever, while other parts of the city were exempt from the disease. Examination limited this area to about five acres. In the centre of this district was situated a well, the surroundings of which were extremely filthy. About thirty feet distant was a privy, and the drainage of the vault was towards the well. On opening the well the water was found clear and free from odor or taste. On microscopical examination, nothing unusual was found, and chemical examination disclosed little else of importance beside a considerable amount of sodium chloride. The presence of the sodium chloride pointed to sewage pollution, as proved to be the case. To test the influence of the water upon those using it, a thorough census of all the families in this district was taken; the number of persons using the water ascertained; also the number using water from any other source, and the cases, character of illness, and deaths which had occurred during the previous six months. This was done with the following result:

"Eighty-seven families, consisting of 492 persons, occupy the district; forty families, comprising 219 persons, *use* water from the well. Among these occurred twenty-three cases of typhoid fever and one of diphtheria during the period taken. Forty-seven families, consisting of 273 persons, did *not* use the water. Among these occurred only two cases of typhoid fever during the same period. Among those using the water the ratio of sickness was one in every 9.12. Among those not using the water, one in 136.5, or fifteen times as much sickness from zymotic disease among the families using the water. It was ascertained that the *first case of typhoid* in the district, during the time considered, *occurred in the family occupying the premises on which the well was located.* The well was immediately closed, and *not another new case of typhoid had appeared* after two months in this section."

Dr. Stoddard, I suppose, infers that the alvine discharges from this first patient were thrown into the privy mentioned, and by drainage made their way into the well, and that this was the real source of the poison which was disseminated through this district.

THE LESIONS OF TYPHOID FEVER.

The most important of the lesions of typhoid fever is found *in the blood*, and yet we do not know fully in what that lesion consists. We find that as the disease advances, the blood becomes less and less coagulable, so that at the termination of some of the fatal cases it will not coagulate at all. That this loss of coagulability is progressive is learned pretty clearly from some observations made in Bellevue Hospital. For example, a sufficient quantity of blood was drawn in the first week of the disease, to enable us to ascertain its qualities, and it then coagulated like healthy blood; in the second week it coagulated but feebly; and in the third week portions of it did not coagulate at all. These were severe cases.

It is a question whether this change is due to a real diminution in the quantity of fibrin, or whether it is caused by such change in the quality as prevents it from forming fibres.

In addition to the fact that the fibrin seems not to be present in normal quantity, there is a disintegration of the coloring matter of the blood, and the formation of dark pigments, spoken of as occurring in the blood of persons who have remittent or intermittent fever.

By reason of the change which occurs in the blood, it is supposed to lose much of its nutritive power.

Those organs, therefore, which receive a full supply of blood are likely to suffer most. Hence, *the spleen* becomes enlarged and softened. The softening is so considerable sometimes that the organ is pultaceous, and can be very easily puncturated by the finger. It has a dark color, and the enlargement is usually to two or three times its natural size. The enlargement and softening of the spleen is almost a constant lesion in the fatal cases. In almost all cases of typhoid fever some enlargement can be detected by percussion during life. In the abortive cases the splenic lesion may not be present; and also, in those cases which terminate fatally early, it is not so marked.

The mucous membrane of the stomach naturally receives a full supply of blood. This membrane, therefore, in about one-half of the fatal cases, is found thickened and soft, and more vascular than normal.

Again, *the heart* receives a free supply of blood. Its functional activity is somewhat increased in this disease, but the organ is not well nourished, and it undergoes softening, so that when removed from the body and laid upon the table, to use M. Louis's expression, it falls together "like a wet rag," in about one-half of the fatal cases. Its color is darker than normal; and the color of the *voluntary muscles* of the body is also dark.

In many of the fatal cases there is a change occurring in *the lungs*. The posterior portion, below the level of the great vessels which carry on the circulation, undergoes such a degree of congestion, that the lung tissue becomes really softened. Inasmuch as this change in the lungs produces an appearance somewhat like that seen in the spleen, it is called *splenization*. The lungs become greatly engorged with blood, present a dark appearance, and during life there is evidence of considerable effusion into the bronchial tubes. If typhus can be said to be a disease without lesions, typhoid can be said to be a disease having a great many. The brain does not undergo softening. The liver does not undergo softening, and why not, I am unable to say.

Besides the lesions already mentioned, we have to speak of ulceration of mucous membranes, the most

important of which is the ulceration occurring in the mucous membrane of the intestinal canal. This has been called the Peyerian lesion, but that term does not fully describe it, because the same change occurs upon a smaller scale in the solitary glands. The ulceration of Peyer's patches has also been called *the characteristic lesion* of typhoid fever. There is also a tendency to ulceration in other mucous membranes, in the throat for example, and upon the epiglottis.

What is known as the Peyerian lesion I will now describe. The first thing noticed in these Peyerian patches is an elevation of the mucous membrane; there is not much vascularity in the new material which produces the elevation, hence they are rather pale. This pale, elevated surface, not infrequently, is dotted with black points, which give it an appearance somewhat resembling that of a newly shaven chin; it has been called the shaven-beard appearance. The Peyerian patches first affected are those near the ileo-cæcal valve; the diseased action advances upwards, and in exceptional cases glandular changes may be seen in the duodenum. In these Peyerian patches, and in the mucous membrane that covers them, a new material is deposited, which is partially cellular, and partly granular, and possesses a very low degree of vitality. There is considerable vascularity in the mucous membrane adjacent to the Peyerian patch, but none on elevation itself.

Gradually the new material, which has been deposited in these patches, softens. It softens somewhat irregularly, so that the mucous membrane upon them will be perforated with numerous little openings. These holes become larger and larger, and some of them coalesce. In this manner a considerable portion of the elevated part is removed, and an ulcer with overhanging edges formed. By a continuance of the same degenerative process into granules and oily material, the remainder of the gland structure is removed and the ulcer covers the whole patch. Thus everything is removed which lies inside of the muscular layer of the intestine. When this is completed the process of healing commences, and a delicate membrane is soon formed which covers the entire surface of the ulcer. This membrane grows thicker and thicker until the process of cicatrization is completed. The Peyerian glands are not again formed, nor are the villi reproduced which normally cover the affected patches. There is remaining then simply new fibrous tissue, which assumes the appearance of mucous membrane. Cicatrization occurs first upon the ileo-cæcal valve, or near it, and advances upward. In some instances the reparative process can be seen in the lower part of the small intestine, while higher up the advancing stage of degeneration exists.

Here I must repeat, because it is so apt to be forgotten, that associated with this ulceration of the Peyerian patches there is always *enlargement of the mesenteric glands*. The process, then, is not simple, but one which involves two important parts of the body. With reference to the ulcers, in a very great majority of cases the ulcerative process is arrested at the muscular layer of the intestines. In some cases it goes deeper, and destroys a portion of that coat; and, in about three out of one hundred fatal cases, death is produced by peritonitis following perforation of the intestine.

When perforation occurs, the case almost always terminates fatally; and yet I am pretty confident that I have cured one case in the person of a physician. He had well-marked typhoid fever, was in the third week of the disease, when suddenly pain was developed in the abdomen, and was accompanied by great prostration. At first the pain was confined to one spot; it soon spread, however, over the entire abdomen; the pulse became rapid and small, the features were pinched, and there was no doubt but that perforation of the bowel had occurred. He was treated pretty vigorously with opium, and finally recovered. I urged him to order in his will, that at his death a post-mortem examination should be made for the purpose of deciding whether or not the diagnosis was correct; but he failed to do so. Perforation of the bowel does not occur in the early stage of the disease. These ulcers may also cause another symptom which sometimes is alarming and serious. They sometimes reach a blood-vessel of considerable size, penetrate its coats, and thus give rise to hemorrhage. The proportion of cases in which hemorrhage from the bowels, more or less severe, occurs in typhoid fever is somewhat greater than that in which perforation takes place. The danger from hemorrhage depends upon the size of the vessel opened; but it is always a grave symptom. Yet several hemorrhages may occur, and no very great amount of exhaustion be produced.

These are the important facts connected with the lesions of typhoid fever, if we do not include among them the eruption. As the eruption is commonly called a symptom, we will refer to it under that head, at which point we have now arrived.

SYMPTOMS OF TYPHOID FEVER.

The *invasion* of typhoid fever is almost always rather insidious. A person may rise in the morning feeling as well as usual, but, in the course of the day, he may feel a certain degree of illness not easily described—perhaps has wandering pains about the body and headache; he may have little creeping chills down the back, and has no desire for food. If he examines his pulse, it is found to be somewhat accelerated. This indefinite period is of indefinite duration, and may extend over a day or two. The beginning of the fever is dated from the chill. The chill is not a hard shake, but little chills are produced by putting the hands into cold water, or by cold air falling upon the patient; or without these provocations the little chills may diffuse themselves over the back and body. I have sometimes called these chilly sensations *diluted chills*. In the meantime the temperature of the body is increased, and the pulse has increased in frequency. By the end of the second day there is usually considerable fur on the tongue, and it will be literally of a snow-white color. The patient perhaps has not yet taken to his bed, and he will sit by the fire, even in moderately warm weather, in order to remove this chilly feeling.

These symptoms increase gradually; the patient goes to bed; the pulse gradually increases in frequency from day to day; the temperature of the body becomes a little more elevated each day for about one week. In the meantime the mind usually remains clear. The countenance does not have the dusky hue seen in typhus, and the eyes do not become suffused.

In a certain proportion of cases, on one of the early days of the disease, epistaxis occurs. It is nothing alarming, and may be repeated. The patient gradually loses strength. There is also, pretty early in the disease, tenderness in the epigastrium, and also tenderness in the right iliac region. As the disease advances it is not uncommon to get gurgling in the right iliac region or palpation. Pretty soon the bowels begin to be distended; digestion, intestinal as well as gastric, is incomplete, and the gases accumulate in the intestinal tube. Gradually a tym-

panitic state of the bowels is produced, which is usually quite noticeable.

In some cases the tympanitic distention of the bowels becomes so considerable as to be the cause of suffering and difficulty of breathing.

Pretty early in the disease a diarrhœa begins; and by a diarrhœa is meant two or more liquid stools in twenty-four hours. A diarrhœa is present in the majority of cases, yet it is not essential to the existence of this disease.

Occasionally these evacuations are multiplied to the number of fifteen or twenty in twenty-four hours, but usually there are not more than five to eight. There is a peculiar brownish hue to the discharges, which has been regarded by some as characteristic; but I am not sure about that.

The mind remains clear for a few days, and then, in the graver cases, comes that muttering delirium already considered under the head of typhus fever. With that there is very likely to occur some obtuseness of the senses. There is that same deception of sight noticed in typhus; consequently the patient, when very sick, will pick at the bed-clothes, and the air. At the same time he is usually more or less deaf, so that you will be obliged to speak in a loud tone to make him hear. The delirium usually lasts until the subsidence of the fever. The fur on the tongue, although of a perfectly white color at the beginning, soon becomes yellowish, then brown, and in the second week of the disease the tongue, quite commonly, becomes dry. It may become so dry that its movements will give rise to fissures, as in typhus, and there will also be some collection of sordes upon the teeth, gums, and lips. There is another appearance of the tongue not infrequently seen: the fur, in the second week, may leave it altogether, and the surface will have a smooth shining appearance and a beef-red color. This is what has been called the *beef tongue*, and it is usually dry, but not cracked.

Original Communications.

ON THE USE OF ELECTRICITY IN THE TREATMENT OF EPILEPSY.

By A. D. ROCKWELL, M.D.,

ELECTRO-THERAPEUTIST TO THE NEW YORK STATE WOMAN'S HOSPITAL.

(Read before the New York County Medical Society, March 25, 1878.)

That electricity is of some value in the treatment of epilepsy I have for a long time believed, and while my observations in this direction do not enable me to assert the exact measure of benefit that we may hope to derive from its use, either alone or in conjunction with approved methods of treatment, they may, perhaps, throw some light on the subject, or, at least, awaken an interest that may lead to a more extended experience as well as to a greater accuracy of observation. I wish to say, first, that in many instances where patients have been submitted to central galvanization—galvanization of the sympathetic, or to general faradization—a profound tendency to drowsiness has been observed.

In some cases sound sleep has for a few moments been induced, with the subject in an upright position while receiving the current through the brain. I recall one patient under treatment by central galvanization who was repeatedly put to sleep within a minute after the beginning of the application.

Accepting the theory that a state of cerebral anæmia predisposes to sleep, it is not very difficult to believe that the feeling of drowsiness that so often follows central galvanization, and even general faradization when specially directed to the cervical ganglion, is due to the direct action of the current on the vaso-motor nerves.

It seems hardly necessary at this date to attempt a detailed argument in proof of the very decided action of electricity in any of its manifestations on the arterial circulation.

The well-known effects of direct applications to the sympathetic of the living animal, the results following external applications to the sympathetic, observed through the ophthalmoscope and sphygmograph, and other physiological experiments, have long attested this power of the current.

Among later experiments are those of O. Tschetschott (Abstr. in St. Petersb. med. Wochenschr., Oct., 1876), and Przewaski (Deutsche med. Wochenschrift, No. 43), who have investigated the action of galvanization of the sympathetic. The latter found that a lowering of temperature of one side of the face occurs upon faradization of the corresponding ganglia, the decline of temperature ranging from 0.5° to 1.75° Cent., according to the length of the application. In the same way he found that faradization of the ulnar nerve is followed by a decrease of from 0.7 to 2.53 Cent. in temperature in the region between the third and fourth fingers supplied by this nerve. Tschetschott's results are similar.*

I have at this time under treatment a patient who has been under the care of both the late Dr. Peaslee and Dr. Janvrin, and who illustrates, better than any case I ever saw, this control that electricity has over the circulation. For several years this patient has been a great invalid from uterine congestion and displacement, and although now much better of her local troubles, suffers night and day from excessive action of the heart. This activity is altogether functional in character, and in a measure probably dependent on reflex influences, for increase of local pain invariably accelerates the pulse.

It (the pulse) is usually anywhere from 95 to 120, but it frequently rises as high as 160. When at the latter point an application of general faradization invariably reduces the pulse from 40 to 50 and sometimes 60 beats. When no higher than 125 to the minute, a similar application reduces the number some 30, and when the pulse is beating with its usual frequency, say 95 to a minute, the treatment brings it down some 5 to 10 beats. I have tested this case thoroughly and carefully, and find that no local applications of either the galvanic or faradic currents will give as satisfactory results as general faradization. It is needless to say that the relief following such application is considerable, and the tendency to this unusual excitation seems to be growing less and less.

A case that suggested a certain similarity between the action of bromide of potassium and electricity occurred in the person of a lad, mentioned on page 558 in the second edition of our work on Medical and Surgical Electricity. The case was one of petit mal, and for two years the attacks occurred from six to ten times a day. In 10-grain doses, the bromide of potassium reduced the paroxysms to one, two, or three in the twenty-four hours. This improvement continued for a month, when, notwithstanding the increased doses of the bromide, the attack gradually increased in frequency. General faradization with galvanization of

* Journal of Nervous Diseases, Jan., 1877, No. 1, vol. ii.

the sympathetic were then resorted to, and the results that followed were substantially the same as those obtained from the bromide. The epileptic seizures were reduced to from one to three a day, but after a few weeks they returned with their usual frequency. Subsequently, in two other cases of petit mal that came under my notice, the same similarity in the action of the bromide and electricity was noted. Recovery followed in one of these cases. The patient, a girl aged eleven, first observed the attacks in the early part of 1874, and came under my observation in March, 1875. At first the paroxysms occurred but once or twice a week, but in about six months they began to increase in frequency, and for several months before I saw her she was having them as often as once and sometimes three times a day. The attacks were of short duration, lasting not more than one-half to a minute and a half, and although for the time there was perfect unconsciousness, yet the patient, if standing, as was usually the case, never fell, but if engaged in any occupation, immediately resumed it after the attack had passed away. I used at first the bromide of potassium alone, and pushed it until the face was covered with acne. As in other similar cases she improved very decidedly through several weeks and then rather quickly relapsed. It is proper, however, to state that this relapse may have been due to a neglect, to which she confessed, of regularity in taking the medicine. I then subjected her to central galvanization and general faradization, alternating the methods and allowing a day to intervene between each application. She improved much less rapidly than under the bromide, but the improvement that followed was retained. At the end of three months she was having but one attack in a period varying from ten days to two weeks, and in just eighteen weeks from the beginning of treatment she had her last attack.

Miss W., aged thirty, came to me November 4, 1876, with the following history: In the early part of 1872 she had her first attack in the night, while asleep, but for a year previous had occasions of being in a dazed condition with great confusion of memory.

It is as well to state that there had been all along in her case a strong hysterical element that is frequently aggravated by surrounding influences.

The attacks for a while occurred once in about seven weeks, and further on, instead of a single paroxysm, she would have two and sometimes three in the succeeding twenty-four hours. Later still, the attacks became as frequent as once a month, with one or two longer intervals. I learned that Dr. Geo. J. Fisher, of Sing Sing, had formerly been her physician, and, in answer to a letter of inquiry, he informed me that the patient had been under his care for a long time.

He had given her the bromides of potassium and soda (of each 10 grs.) three times a day. This she had taken for several years, and was still taking when she came under my care. During the month previous she had three attacks, and was feeling certain premonitions, which she described, when I submitted her to the additional treatment of the electricity. I did not feel justified in discontinuing medicine, but in order to give her every chance, substituted for it the following formula of Brown-Séquard:

℞. Potassæ bicarbonatis..... 3 ij.
Ammonii bromidi..... 3 vij.
Potass. iodidi..... 3 iij.
" bromidi..... 3 iij.
Infus. calumbæ (British)..... Oj. M.

S. Teaspoonful at each meal, and three teaspoonfuls at bedtime.

The patient was exceedingly nervous and despondent, and it was evident that if in no other way electricity might prove of service, as an adjunct to allay irritability and as a general tonic.

I treated her every other day for three months, alternating central galvanization with general faradization. I then gave her an interval of rest for three months, during which time she had an attack, occurring a little more than six months from the last. After a second three months' treatment I allowed another interval of rest, and again treated her for three months. She has not had a second attack, and as eighteen months have passed during which she has had but one seizure, we are hopeful of ultimate results. It is worthy of note that, since the two methods of treatment have been combined, the bromic acne has very considerably lessened, and at times is hardly perceptible.

The last and seemingly the most satisfactory case in its results that I have to relate is as follows: P. M., a pedler, aged thirty-two, entered my office for the purpose of disposing of his wares, March 14, 1877. The man was of respectable appearance and average intelligence, and while conversing with him he had a slight epileptic seizure, and would have fallen from his chair if I had not supported him. When consciousness returned, after what seemed to be a very short period—perhaps not longer than one or two minutes—he seemed to recognize the fact that the attack had been of short duration, and on inquiry gave the following history: He was a native of England, had been in this country two years, and had had the first epileptic attack eighteen months previously. As near as he could remember, the second attack occurred after an interval of six weeks—the third in four weeks; thereafter they gradually increased in frequency, and during the last six months had occurred as often as twice a week. Most of the attacks were light and soon over, as the one that I witnessed, but at least once a month, as he informed me, they were much more severe—the aura being recognizable—with slight lacerations of the tongue.

He had been under no professional care, but had taken a good deal of "salty-tasting medicine," administered to him by some druggists. He recognized the name of bromide of potassium, and said he thought that was the medicine.

Upon proposing that he submit himself to my treatment (gratuitously of course) he readily consented, and thinking it to be a good and fair opportunity I placed him under central galvanization, with occasional séances of general faradization.

I treated him every day excepting Sundays (when I was out of town) for six weeks. March 16th, he had one of his severe attacks. March 22d, one of the slighter seizures. March 31st, another slight attack. April 14th, a third attack of a mild character. On April 20th a paroxysm of the more severe type took place, but evidently considerably modified in intensity and duration.

This was the last severe attack that he had. On May 4th he said that during the morning he thought that he had experienced a very slight paroxysm, but it was so transient that he was hardly aware of it. I saw no more of him until the following September, when I accidentally met him on the street. He looked well, said that he had had no more attacks, expressed gratitude for the services rendered, and promised to call at my office, but up to this time he has failed to do so.

In considering these few not altogether unsatisfac-

tory results, a question arises which, in its relation to electricity, has a special significance.

Why do not our therapeutics yield more uniform results? Experience very clearly shows that there is hardly a remedy to the effects of which there is such a varying degree of susceptibility and response as to electricity. To use a strong expression, there are some persons, although perhaps but a small proportion, who were not born to be thus treated. If, while in health, it is given to them, the impression is decidedly unpleasant, or if administered for the relief of pain or nervous irritability, or as a general tonic, it fails in its effects, if it does not aggravate the symptoms. On the other hand, there are those upon whom it leaves a delightful impression, and with whom it seems always to agree, and while much does indeed depend on the knowledge and adroitness with which the applications are given, this difficulty of foretelling the results that may be expected from the use of the current in given cases is largely the result of inherent differences of susceptibility.

Dr. Meredith Clymer, in some most excellent remarks on the treatment of epilepsy, states that he has never heard of a permanent cure of the disease under the use of the bromides, either alone or in combination.

While we may regard this as an extreme statement, the suggestion, that the best results will follow only when we call to our aid every measure that will tend to increase and develop vital power generally, commends itself to all. It is not alone, therefore, on the theory of a special influence on the nerve-centres, or over the cerebral circulation, that we employ electricity as an adjuvant to the bromides, but also because of its undoubted and powerful constitutional tonic effects. In this, therefore, as in various other forms of central disease, I almost always with central galvanization associate and alternate general faradization. In regard to the frequency of the applications I should say, excepting in special cases, the séances, with alterations of the currents, might with advantage be repeated every day. Concerning the length of the applications there is so much that might be said, that I can hardly undertake to say it here. The universal tendency is to unduly prolong the treatment until secondary exhaustion follows, and more harm results than good. Dr. Lincoln, of Boston, has written an article on this theme which I would commend, at the same time suggesting that we bear in mind the aphorism, "Much too little than a little too much."*

I seldom continue the applications of the galvanic current to the brain and sympathetic longer than three minutes, and, as a rule, in from five to ten minutes you accomplish as much by general faradization as is possible. Here as elsewhere, however, individual idiosyncrasies must be studied, and in the details of treatment much is left for the exercise of judgment and experience. In applying the galvanic current to the central nerves, I place one electrode—the negative—over the solar plexus and the positive on the top of the head. The sponge which is over the cranial centre, and on which is pressed a large flat metal electrode, should be very large, covering nearly the whole surface of the head.

Small sponges should not be used. They cause too great concentration of current; pain follows, and far less is accomplished. Having the sponges at either pole, large, soft, and applied with firm pressure, and gradually and without interruptions increasing, and in the same way decreasing the current, it is surprising what tension can be borne without the slightest sense of discomfort or unpleasant after-effects.

THE OTHER CINCHONA BASES COMPARED WITH QUINIA.

By WILLIAM K. NEWTON, M.D.,

NEW YORK.

THE question, whether the other cinchona bases can be substituted for quinia, is rapidly becoming an important and interesting one.

The exhaustion of some of the *natural* cinchona plantations is only a question of time, and we will be compelled to rely upon the bark obtained from *cultivated* cinchonas. The latter varieties are not the best, as they contain a lower percentage of quinia and a higher percentage of some of the other bases, especially cinchonidia; hence, in the future, the disproportion between the two alkaloids will be greater than now.

There is every reason to suppose that chemistry will some day discover the process for elaborating an artificial quinia, and make us independent of the cinchona plant. In the European laboratories, today, attempts are being made to produce an artificial article; how soon the problem may be solved no one can, of course, conjecture. We must now depend on the natural resources, and make the most economical use of the alkaloids as they exist.

The recent high price of quinia has prompted many physicians to experiment with the other and cheaper alkaloids with satisfactory results, as we think will be shown in this paper. As an evidence of this trial, now going on, the medical journals, for the past two years, have contained many reports, giving the results of experiments made with quinidia, cinchonidia, and cinchonia. An attempt is here made to collect the scattered testimony, *pro* and *con*, and place the subject before the profession, so that some definite conclusion can be arrived at.

The alkaloids we have to consider are quinidia, cinchonidia, and cinchonia—or, more properly, the sulphates, as the alkaloids are never used in medicine.

Quinidia is isomeric in chemical composition with quinia; it is less bitter than the latter, and its sulphate is more soluble. The sulphate of quinidia is soluble in 130 parts of water at 62° F. and in 16 parts of water at 212° F.; it is almost insoluble in ether. Cinchonidia sulphate has a harsh, bitter taste, and is about as soluble in water as quinia sulphate.

Cinchonia is isomeric with cinchonidia. It is the only one of the three alkaloids mentioned recognized by the U. S. P. The sulphate is soluble in 54 parts of water at 62° F. and in 7 parts of alcohol; it is sparingly soluble in ether.

It is difficult to give an idea of the proportion in which the alkaloids exist in the different varieties of cinchona. No accurate analysis of the pale and yellow barks (the varieties used by manufacturers) has been published; but the red bark has been very carefully analyzed in India—this is the variety cultivated there. We give below analyses of the latter bark, made by the Quinologist to the Madras Government.*

PARTS PER 1,000 IN CINCHONA SUCCIRUBRA.

Total alkaloid.....	6.74	7.43	7.60	7.85	7.40
" sulphates.....	6.06	6.43	6.00	5.45	5.98
Quinia sulphate — obtained crystallized...	2.21	1 51	1.40	1.15	1.57
Cinchonidia sulphate—obtained crystallized.	3.85	4.92	4.60	4.30	4.42

* Blue Book: East India Cinchona Cultivation. London, 1870.

The figures give the average of four different years' growth; different samples would give very varying results.

It will be noticed that no quinidia exists—or only in small amounts—in the red bark. The yellow and pale barks contain more quinia and cinchonidia than the samples analyzed, as above.

Another point to be kept in mind is that the commercial salts are apt to be contaminated, the one with the other.

We are informed by Mr. Chas. Rice, the able Pharmacist of Bellevue Hospital, who has made a study of the chemistry of the cinchona alkaloids, that he has examined a large number of specimens of the sulphates of the alkaloids, made by our best manufacturing chemists, and he found various grades of impurity. Some specimens of quinia sulphate contain from 17 to 85 per cent. of cinchonidia and quinidia sulphates; and specimens of quinidia sulphate invariably contained large quantities of cinchonidia sulphate. It is impossible to place on the market a chemically pure sulphate of quinia without making the price so high as to place it beyond the reach of the consumer. Repeated recrystallizations are necessary to insure purity, and these repeated manipulations greatly enhance the price.

Thus we see that allowances must be made for the results obtained; chemically pure salts were used by the India Commissions, but the experiments made by Americans were with the commercial salts, which are, in fact, mixed salts.

Dr. E. B. Baxter has experimented on putrefactive solutions, and on the movements of the white blood-globules, with the various cinchona bases. He found that all the alkaloids have the property of preventing putrefaction and the production of bacteria; and also that the movements of the white globules were arrested or impeded by the application of solutions of these bases.*

If there be any truth in the germ theory of the origin of malarial fevers, these experiments may explain the uniform results obtained by observers from the use of the alkaloids.

The most valuable testimony we have to bring forward is that given by the medical officers under the East Indian Governments. Their experiments were aided by a liberal supply of the salts, and incited by the interest taken in the local cinchona plantations fostered by the Government.

Surgeon Dougall, of the Madras Army, reports† that the results of investigation, made at the suggestion of the Inspector-General of the Medical Department, are as follows: He used the salts in selected, well-marked cases of malarial fever, which were treated indiscriminately in rotation. He treated 108 cases of intermittent; 16 of which were tertian, 2 quartan, and 89 quotidian. Quinidia sulphate was used in 39 cases, cinchonidia sulphate in 35 cases, and cinchonia sulphate in 34 cases. The whole 108 cases recovered. In 27 cases no paroxysm occurred after the first dose; in 30 cases the treatment required to be continued 2 days, and in 14 cases 3 days. There was very little difference between the salts in the necessary duration of treatment; but a difference was observed in the doses required. The average dose of quinidia varied between 31 and 70 grains; cinchonia, 54 to 76 grains; and cinchonidia, 43 to 90 grains. The conclusion is that quinidia is the most powerful, cinchonidia the next, and cinchonia the least active; but even the latter is energetic, and, in adequate doses, a sure remedy.

Surgeon-Major Hunter reports* that the Government having ordered that the therapeutic value of cinchonidia be tested, he made trials of it in the House of Correction and County Jail of Bombay with the following results: He treated 55 cases of intermittent, using doses of from 5 to 10 grains. In the majority of cases, 3 days, equivalent to the consumption of 90 grains, in 10 grain doses, three times daily, sufficed to effect a cure. In some cases of a severe type the drug failed, and quinia had to be resorted to. In nearly every case where cinchonidia was used, cinchonism was developed. Nausea and vomiting were frequent symptoms—more frequent than with quinia. Dr. Hunter concludes that 10 grains of cinchonidia would be required to produce the same effect as 3 grains of quinia. (He used the commercial salt.) He says that the drug is greatly inferior in value to quinia. This conclusion does not coincide with the observations of the other Indian surgeons.

Prof. Ewart, of the Calcutta Medical College, states that "quinidia is an excellent anti-periodic in from 20 to 10 grain doses; that it is not inferior to quinia, and is tolerated easily by the stomach. Its action is not accompanied by cinchonism."

"Cinchonidia stands next to quinidia in power; it is agreeable to the stomach, and is not followed by cinchonism."

"Cinchonia is doubtless an anti-periodic in doses from 20 to 10 grains. The irritability of the stomach caused by it is the great objection to its ever taking rank as a substitute for either of the preceding alkaloids."†

In the year 1866 large quantities of the various sulphates of the alkaloids were sent by the Home Government to the Government of Madras, to be distributed by the Inspector-General of the Medical Department to the surgeons and other responsible medical men under him. These salts were manufactured by Howard, of England, and were chemically pure. They were to be impartially tested, and the results reported to the Inspector-General. From these reports we obtain most trustworthy testimony.

The first report of the Madras Commission includes the time from the receipt of the samples to March, 1867.‡

Number of cases of malarial fevers reported, 1,145; 376 treated with quinidia sulphate, 359 with cinchonidia sulphate, and 410 with cinchonia sulphate. From 8 to 10 grains daily were administered. Out of the total only 4 deaths occurred from pneumonia or diarrhœa complicating. Of the remaining 1,141 cases only 30 failed to recover.§ Judging from these facts the Commission are of opinion that these alkaloids are scarcely inferior, if at all, to quinia—the difference being looked on as one of degree, not of kind.

From the above period (March, 1867, to April, 1868), 2,472 cases were treated with the sulphates of the four alkaloids—quinia, quinidia, cinchonidia, and cinchonia—in order to make the comparative trial as perfect as possible.‖

Of the 2,472 cases 2,445 were cured, and 27 failed of cure.

* Practitioner, vol. xii., p. 321.
† Edinburgh Med. Journal, vol. xix., p. 193.

* Lancet, May 15, 1875.
† Indian Annals of Medical Sciences, No. xxv.: and King's Manual of Cinchona Cultivation in India. Calcutta, 1876.
‡ For the reports, which are too long to be here given in full, see Blue Book: East India Cinchona Cultivation (London, 1870), p. 107 *et seq.*
§ The total of failures was 34, *not* 27 as given in the original report. The error made by the Commission is one of addition.
‖ Loc. cit., p. 156 *et seq.*

Quinia sulphate was used in 846 cases; 840 cured, 6 failed. Time taken to effect a cure, 1 to 7 days. Doses varied from 2 to 20 grains daily.

Quinidia sulphate was used in 664 cases; 660 cured, 4 failed. Time, 1 to 8 days. Doses, 2 to 30 grains daily.

Cinchonidia sulphate, 403 cases; 399 cured, 4 failed. Time, 1 to 4 days. Doses, 2 to 30 grains daily.

Cinchonia sulphate, 559 cases; 546 cured, 13 failed. Time, 1 to 8 days. Doses, 2 to 30 grains daily.

We may tabulate the result thus:

	No. Cases Treated.	Failures.	Ratio of Failures per 1,000 Cases.
Quinia sulphate...	846	6	7.09
Quinidia " ...	664	4	6.02
Cinchonidia " ...	403	4	9.92
Cinchonia " ...	559	13	23.25

The Commission, in their two reports, tabulate, as treated, 3,617 cases, with 61 failures. These cases we have footed up in the following table, so as to give the ratio of failures per 1,000 cases. This, we think, will give the most correct basis to estimate on:

	No. Cases Treated.	Failed.	Ratio of Failures per 1,000 Cases.
Quinia sulphate...	846	6	7.09
Quinidia " ...	1,040	15	14.42
Cinchonidia " ...	763	17	22.80
Cinchonia " ...	969	23	23.84

The conclusion expressed by the Commission is as follows:

"In regard to the relative effects of the three alkaloids, and with them chemically pure quinia sulphate, the evidence derived from their use shows that, with the exception of cinchonia sulphate, they in a remarkable degree so closely resemble each other in therapeutical and physiological action, as to render distinctive description of little or no practical utility." "In a large proportion of cases in which they were tried chemically pure quinia sulphate and quinidia and cinchonidia sulphate appeared to indicate nearly equal febrifuge power, and in equal circumstances their use produced almost the same physiological results." "The result confirmed the general opinion expressed by the Commission last year, and likewise conclusively established beyond doubt that ordinary quinia sulphate, chemically pure quinia sulphate, and quinidia sulphate possess equal febrifuge power; that cinchonidia sulphate is only less efficacious, and that cinchonia sulphate, though considerably inferior to the other alkaloids, is notwithstanding a valuable medicinal agent in fever.*

We will now turn to the testimony as given by physicians in our own country.

The Medical Board of Bellevue Hospital reported in 1876,† after one month's trial of cinchonidia sulphate, almost to the exclusion of quinia, as follows:

The surgical members of the Board declare cinchonidia to be a valuable tonic, and anti-febrile remedy, but find it to be totally inadmissible in severe surgical injuries, especially to the genito-urinary tract and in cases of shock, when it is apt to produce emesis. In such cases cinchonidia had to be abandoned and quinia used. In purely medical affections, however, it was found to act with promptness and certainty, but sometimes requiring a larger dose than quinia. Since this report was made cinchonidia has been used in Bellevue and Charity Hospitals, replacing quinia to a greater or less extent. As no published reports have been made, the writer has to depend on oral communications.

In April, 1877, a circular letter was issued by the supervising Surgeon-General of the U. S. Marine Hospital Service—Dr. Jno. N. Woodworth—calling the attention of the medical officers of the service "to the accumulating testimony in favor of the employment of quinidia, cinchonidia, and cinchonia sulphates, of which the two first named are believed to be as efficacious as the quinia sulphate." The circular suggests that these salts be accorded a fair trial. No published reports have, as yet, been made, but Dr. Woodworth informs us "that many of the officers of the service have reported favorably upon the action of the quinidia and cinchonidia sulphates, which they have used in place of quinia sulphate." He further states, "that the reports so far received would seem to indicate that in the future the salts of quinidia and cinchonidia will be as extensively used in the service as those of quinia, and possibly more so, should the prices continue as heretofore."

Dr. N. D. V. Howard, of the St. Louis Insane Asylum, states that he has used, in the past seven months, forty ounces of cinchonidia sulphate; he has tabulated 100 cases of intermittent as treated with this salt. The average length of treatment was 4.3 days; average amount taken, 83.7 grains, or 19½ grains daily. In no case did it fail to do all that could have been expected of quinia sulphate. "Observation of its effects has tended to strongly convince me that, when fully as efficient as quinia, it is much more gentle in its action, rarely producing tinnitus aurium, deafness, or other head symptoms."*

Dr. Love, physician to the St. Louis Dispensary, reports that he has treated 596 cases of malarial diseases with cinchonidia sulphate. It was quite as effectual as quinia, and given in the same doses. Out of the 596 cases there were six cases of failure and fifteen relapses.†

Dr. Pardum, of Illinois, states that he has used cinchonidia sulphate since the early part of 1875 quite extensively in intermittent and remittent, with results, he says, equal to quinia, and with the further advantage that his patients suffer less from cinchonism.‡

Dr. Hobbs tabulates 300 cases of intermittent and remittent, treated, in the past three months, with cinchonidia sulphate, almost to the exclusion of quinia, and out of the whole number has been compelled to resort to other drugs in but five cases. He gives it in doses one-third larger than quinia.§

From many letters received from the South and West we are satisfied that cinchonidia sulphate is fast replacing quinia, and the advanced price of the former salt would lead us to suppose that the demand for it has increased markedly in the past six months.

The writer's personal experience would lead him to favor quinidia sulphate over all the cinchona bases, quinia sulphate only excepted. He has used it in intermittent and pneumonia, and has found it equal to quinia in all respects.

In estimating the value of the reports, given in this paper, it must be borne in mind that the chemically

§ Louisville Med. News, Nov. 24, 1877.

pure salts were used only by the East India Commissioners, and that the reports made by Americans are the result from the use of commercial salts, which are all more or less contaminated one with the other; hence they were actually mixed salts of the different alkaloids.

The sample of quinidia sulphate, with which the writer was having such good results, proved, on analysis, to contain quinia sulphate in small quantities, and from thirty to forty per cent. of cinchonidia sulphate.

We would deduce from the above reports that the cinchona bases compare with quinia as follows, in the order given:

Quinidia sulphate, when chemically pure, is almost a duplicate of quinia, and may be given in the same doses; it does not cause any more gastric troubles than quinia; even the commercial salt is as efficacious as quinia.

Cinchonidia sulphate is also closely allied to quinia in its effects, and may be given in the same doses; but it is more apt to cause nausea and vomiting, and even purging, than quinia or quinidia. This salt is not recommended in diseases of the genito-urinary system, or after operations on this tract; neither is it to be given when shock exists.

Cinchonia sulphate is a valuable anti-periodic, but must be given in larger dose than the other salts. It is quite apt to produce gastric disturbances and cause purging.

Thus it may be seen that the three alkaloids may be substituted for quinia; but that quinidia and cinchonidia are better substitutes for that salt.

The statement made by a number of observers that some of the salts do not produce cinchonism must be a mistake, as we have noticed this train of symptoms when any of the salts were used. We think that the evidence given above proves that any of the bases may be substituted for quinia, and that even the mixed salts may be used, in many cases, with good results.

The question does not interest the city practitioner from an economic point of view, but it is one of importance to charitable institutions and to the country practitioners who furnish patients with medicines, and who buy in large quantities.

Since the above was written Dr. L. Johnson has reported on the results he has had from the use of cinchonia sulphate, in his class at the Demilt Dispensary. He has used the salt for years and in a great number of cases. He concludes that it "may be relied upon, in a measure, as a substitute for the sulphate of quinia, whenever, from motives of economy, the practitioner desires such a substitute."* He calls attention to the fact that Prof. Wm. Pepper, of Philadelphia, reported on the use of the salt as long ago as 1853;† also that Dr. A. P. Turner had good results from its use—one hundred cases of intermittent without failure—which he reported in 1864.‡

MONUMENT TO CLAUDE BERNARD.—The Société de Biologie, Paris, has taken the initiative in starting a subscription to erect a fitting monument in memorial of the distinguished services to science of the late Claude Bernard, who was one of the founders of the Society; and a committee for that purpose, composed of prominent men in the leading scientific institutions, has been appointed.

Progress of Medical Science.

REFLEX ECCENTRIC, OR IRRITATIVE ALBUMINURIA.—The induction of albuminuria by the irritation of surgical dressings is a possibility which has hitherto received but little attention from surgeons. Dr. G. Gorrequer Griffith, in a paper read at the Manchester meeting of the British Medical Association, claims to have met with many such cases, and reports one as typical and well illustrating his meaning.

Miss M. had wintered in Egypt on account of tubercular symptoms in her lungs, with best results to her condition. On her return she suffered from a fistula in ano, which was operated upon July 10, 1871. This was dressed in the usual way, but in a few days signs of uræmic poison appeared, and examination showed the urine to be loaded with albumen. Believing that the dressings were main elements in the causation of the symptoms, they were discontinued; the bowels were swept out by compound jalap powder, and the kidneys by diuretics, and in a few days all the symptoms had disappeared. The dressing of the wound was resumed, but return of the symptoms again compelled its abandonment. Cautiously, the dressing was commenced for a third time, was well borne, and the wound healed without further bad symptoms.

There is little doubt, says Dr. Griffith, but that the dressing was the immediate cause of the albuminuria and uræmic symptoms; the irritation caused by its insertion into the wound, producing a stasis of the blood within the kidneys, congestion of the renal circulation, arrest of the urinary secretion, and transudation of the albuminoid elements of the blood. While attending Miss M., the Doctor was greatly exercised over a similar case that had ended fatally, and he feels convinced that had he not recognized the condition, *and the cause of it*, in this case also, a fatal result must have ensued. The congestion of the renal circulatory system, and the arrest of urinary secretion, would result in such structural, organic changes in the kidneys themselves as would be incompatible with life. What was a mere functional derangement, would, if the irritation were persisted in, become developed into organic disorganization, inducing in its turn destructive uræmia, and in this way irritative albuminuria, an element merely temporary, because perfectly remediable, if unrecognized and misunderstood, would be converted into incurable and rapidly fatal albuminuria, dependent on true, permanent kidney disease. — *The Practitioner*, January, 1878.

PROGRESSIVE PERNICIOUS ANÆMIA.—Dr. Stephen Mackenzie reports a very characteristic case of progressive pernicious anæmia occurring in a school-boy of ten years, a much younger age than that at which the disease is usually seen. The child came of a healthy family, and no exciting cause could be discovered. No history of shock or fright was elicited. The diminution in the size of the colored blood-corpuscles (microcythæmia) was well marked, but no nucleated corpuscles were detected. Hemorrhagic extravasations into the retina are usually noticed in pernicious anæmia, and were well marked in this case. According to Litten they have no diagnostic value in distinguishing this form of anæmia from others, for he has found retinal hemorrhages in anæmia from uterine cancer and hemorrhage, menorrhagia, and hæmatemesis. Dr. Mackenzie has examined a large number of eyes of persons suffering from cancer, chlorosis, and anæmia from other causes, without finding hemorrhages, but he is not prepared to dispute

Litten's assertion. A point of much interest in this case was the presence of double optic neuritis. Dr. Mackenzie does not recollect optic neuritis being described, though others may have observed it in connection with pernicious anæmia. Many (*Centralblatt f. d. med. Wissensch.*, 1875, s. 675), in an account of a case, speaks of the papilla being deformed, and of the whole retina being cloudy; but it does not appear from his description that there was neuritis. In this case the swelling of the disc was considerable, and the vessels in places were buried in exudation. The veins were very tortuous, as usual in neuritis, but of a pale color, with a broad light streak. The existence of neuritis caused hesitation in diagnosis in some who saw the case, and taken in conjunction with the pain in the head, and the discharge from the ear with deafness, it certainly suggested coarse cerebral disease. But the headache was not so severe as is usual in intracranial tumors or abscess, and when first seen, although optic neuritis was present, there had been no purposeless vomiting. Moreover, the assumption of coarse intracranial disease did not explain the extreme anæmia. The occurrence of microcythæmia assisted to the diagnosis of progressive pernicious anæmia, and the subsequent progress of the case, the vomiting, febrile attacks without assignable cause, the recurring epistaxis, and bleeding of the gums confirmed the diagnosis. Arsenic, which has been so useful in Dr. Byrom Bramwell's hands, was administered in the form of Fowler's solution without any amelioration of the symptoms. The post-mortem appearances were those usually observed. Dr. Wilks, than whom probably no one has had greater experience in this disease, says that usually no coagula are present in the heart. In this case clots were present in both ventricles, but quite peculiar in character. The enlargement of the heart (undoubted, though the organ could not be weighed) remains unexplained. The examination was made by candle-light. The marrow of the rib and clavicle was observed to be red, but has not yet been examined microscopically. The case will be published in detail when a histological examination of the retina and all the organs has been completed.—*The Lancet*, Jan. 5, 1878.

The Pathological History of Cysto-phosphatic Deposits.—In a paper published in *The Lancet*, Sir Henry Thompson gives an interesting account of the formation of cysto-phosphatic deposits, which he attributes primarily to urinary decomposition. The urine remaining unexpelled from an atonic bladder may, for a long time, retain its normal characteristics, but with the appearance of cystitis, is set up a catalytic action by which decomposition takes place. The urea is broken up and ammonia is formed; the phosphates of lime and magnesia decompose, their earthy bases being precipitated, and from these actions are produced the ammoniaco-magnesian, or "triple" phosphate, as well as some bibasic salts. Associated with these products are found mucus in abnormal quantity, and pus. At first the bladder may be able to expel these products, but soon abrasions occur on the mucous membrane, and the exuded lymph becomes loaded with phosphates, forming a tenacious mixture not easily removed. Phosphates are deposited upon this, and when the aggregation assumes a certain size, it is detached, falls into the bladder as a concretion; the process goes on at the original point and may be repeated again and again. These phenomena explain the reason why cysto-phosphatic deposits in some cases obstinately persist and recur. So long as the mucous lining of the bladder retains its polish, so long as no serious denudation of epithelium takes place, no precipitated phosphates, as a rule, will be detained in the interior, provided the organ can empty itself or can be emptied artificially. The following are the conclusions Sir Henry has formulated in relation to this subject:

1. "That, in its healthy condition, the bladder rarely, if ever, retains, but on the contrary, expels all phosphatic deposits.

2. "That when the bladder is not healthy, but affected by chronic inflammation, provided it is not considerable nor very prolonged in duration, the power of expulsion is still almost as great as in the healthy organ.

3. "That there is a diseased condition of the inner coat of the bladder, in which the ability to expel phosphatic deposits is almost lost, and in which the formation of concretions—and if these are neglected of stone—is certain to occur."—*The Lancet*, Jan. 19, 1878.

Rectal Alimentation.—Feeding per rectum is not a novelty in medical practice, but it has only within a few years received the attention it deserves. Prof. Austin Flint cites some cases which not only illustrate the tolerance with which the rectum receives nutritive enemata, but prove that the body may be well nourished by this means alone for an indefinite period. In one case rectal alimentation was wholly relied upon for a year and three months, and subsequently much of the time for five years; in other cases it was continued for less time, but with equally successful results, the patients frequently increasing markedly in weight. This treatment is indicated when the passage of food into or from the stomach is obstructed, as in disease of the œsophagus, or of the cardiac or pyloric extremity of the stomach; when absolute rest of the organ is required, as in gastric ulcer, hæmatemesis, acute gastritis; in that functional affection of the stomach characterized by almost complete intolerance of food, which is occasionally met with in young women; in those cases of invincible anorexia, occurring in middle or advanced life, which probably depend upon degeneration of the gastro-intestinal tubules; when, owing to blunted mental perceptions, or to coma, an adequate amount of food cannot be introduced into the stomach. Whenever, therefore, the quantity of food injected and assimilated, is insufficient to support life, rectal alimentation is indicated. Prof. Flint's clinical experience is opposed to the assumption of Leube, who supposes that milk, eggs, meat-broths, are unsuited to rectal alimentation. Dr. Flint has found that the rectum digests and assimilates these articles without difficulty, but he does not deny that the addition of such substances as pepsin, pancreatin, hydrochloric acid, etc., may hasten and improve rectal as well as stomach digestion. As a rule, the injections have not been carried above the rectum, though, by means of a flexible tube, they may be easily introduced into the colon. The quantity should not be large, from three to six ounces being the average size of the enemas, but they may be frequently repeated. As soon as the large intestine becomes cleared out, and the bowel becomes accustomed to the injection, the food is retained without trouble, no evacuation taking place for days or weeks. This occasions no inconvenience, and, indeed, the patients are so well satisfied with the process that many are loath to return to ordinary feeding per orem. The injection should be tepid, and directly after administration, firm pressure should be made, by means of a sponge or napkin, upon the anus until the desire for their expulsion passes away.—*The American Practitioner*, January, 1878.

THE MEDICAL RECORD:

A Weekly Journal of Medicine and Surgery.

GEORGE F. SHRADY, A.M., M.D., Editor.

PUBLISHED BY

WM. WOOD & CO., No. 27 Great Jones St., N. Y.

New York, April 6, 1878.

NATIONAL QUARANTINE REGULATIONS.

From present appearances the chances for the establishment of a national system of quarantine seem to be exceedingly good. Already a bill having such an end in view has passed the House of Representatives, and there does not seem to be much doubt but that it will receive equal indorsement by the Senate. Every one who has given much attention to quarantine matters must have been struck with the necessity for some system which, while it was competent to protect the country as a whole, should not interfere with special regulations at particular ports. How this could be accomplished to the best interests of all, has been a question the practical solution of which has been attended with much perplexity. It would seem, however, that all the principal difficulties have been overcome in the bill referred to, and that a wise conservatism has recognized apparently conflicting interests, and thus secured harmonious and systematic action. In its present shape, the bill provides that no vessel or vehicle coming from any foreign port or country where any contagious or infectious disease may exist, or carrying persons, merchandise, or animals affected with infectious disease, shall enter the United States contrary to the quarantine laws of any State; that consular officers or other representatives of the United States at or near such port, shall immediately inform the Surgeon-General of the Marine Hospital service thereof, and the Health Officer of the ports of destination of such vessels in the United States, and they shall make weekly reports of the sanitary condition of the respective ports at which they are stationed; and the said Surgeon-General shall frame all needful regulations for that purpose, subject to the approval of the President; but such regulations shall not conflict with sanitary or quarantine laws of any State or municipality. Officers of the Marine Hospital service and customs officers shall aid in the enforcement of these regulations, without additional compensation. That the Surgeon-General immediately notify the proper State and municipal or United States officers at the threatened port of destination of any infected vessel, and shall make weekly abstracts of the consular sanitary reports to be sent to sanitary and customs officers of the United States; that State or municipal quarantine officers shall be authorized to act as officers of the national quarantine system, but without pay from the United States; at all other ports officers of the Marine Hospital service shall enforce the quarantine regulations under this act; provided, that there shall be no interference in any manner with any quarantine laws or regulations as they now exist, or may hereafter be adopted under State laws.

It will thus be seen that no attempt is made to enforce absurd regulations, but, on the contrary, there is a simplicity about the whole system which cannot fail to impress every one, and to give a reasonable belief of its practicability. The general principle of protection, and the general necessity of its enforcement are the main conditions insisted upon, while much of the detail is very properly left to the discretion of the officers of the ports at which an infected vessel may arrive.

Within the past few years we have made many improvements in our quarantine system. The experience in this port has shown it to be possible to establish a thorough protection against the spread of contagious diseases at the same time that mercantile interests are not interfered with. In fact, so radical has been the change of public sentiment due to the enlightened and liberal administration of our Health Officer, that opposition has given way to support, and complaints have given place to encouragement. As we have on former occasions asserted, this system is for all practical purposes as near perfection as it can be, and after a successful trial of "over six years in one of the largest ports of entry in the United States," t is probably the best model upon which to base the principle of management of the more comprehensive plan. The centralization of authority in the Marine Hospital service is not only eminently proper, but is decidedly the best that can be done to insure for the present at least a reasonably perfect success for the scheme. By and by it may be necessary to enlarge the functions of the office to create possibly a central bureau with requisite authority for supervision and for the modification of plans and the division of responsibilities which a still further elaboration of the plan may make necessary. We say this much, of course, merely by way of anticipation, inasmuch as the bill has not yet passed the Senate, but there appears to be such a small doubt concerning such passage that there is not much danger of being too sanguine regarding it, or too hopeful of the ultimate good which may be accomplished.

THE SPONTANEOUS GENERATION CONTROVERSY.

THE "reply" of Dr. Bastian appears to have generated much spontaneous wrath, if we may judge from the tone of Professor Tyndall's choleric rejoinder. Professor Tyndall first attacks what he terms the new formula of Bastian's, that "it is not the dead atmospheric particles themselves that are kindled into life; it is, on the contrary, the dead particles of the liquid that are kindled into life by the dead particles of the air."

"The former, we are told, is an absurd idea; while the latter, I suppose, is thought to be a sweetly reasonable one."

Tyndall ridicules this "frictionless way" of originating a new birth of living particles, and next directs attention to the doubt thrown out by Bastian, that bacteria originate from spores. On this point Tyndall states that the smallest organisms revealed by the microscope are grouped under the common name of bacteria, while they differ from each other both in size and form, some being globular, some staff-like (whence the name), some motile, and others still. In the staff-like bacteria, the usual mode of reproduction and multiplication is bisective. The staff is nipped in its centre, the nip deepens, and finally the bacterium is divided into two halves, which lengthen and are bisected in their turn.

According to a calculation of Dr. Burdon Sanderson, this process enables seventeen millions of bacteria to proceed in twenty-four hours from a single ancestor.

In cases, however, of certain large bacteria, which, because they are large, have been more thoroughly examined than the others, the rods or filaments are observed to resolve themselves into spores. This resolution was proved by Cohn and Koch, and is conspicuously illustrated by the bacillus of hay, and the bacillus anthracis of splenic fever.

"Both these organisms propagate themselves by spores, which may be rendered as plain to the eye of the microscopist as peas in a pod." In confirmation of this, Professor Tyndall states that he has himself seen the spores of bacillus anthracis which had been cultivated by Mr. Ewart, of University College.

Returning once more to the now historic experiment with the bottled infusions, which Bastian asserted merely proved facts foreign to the points at issue, Tyndall says: let the reader place before his mind one of the sealed chambers before described, and figure its series of test-tubes charged with infusions, which, exposed to optically pure air, have remained sweet and clear for six months in a warm room. Now, suppose the door to be opened and a bunch of dry hay to be shaken in the moteless air of the chamber. A beam thrown through that air shows it to be charged with dust. Forty hours after this dust has been let loose, the infusions are found to have a fatty corrugated scum upon their surfaces—it may be with a clear or a turbid liquid underneath. When this scum is examined, it is found to consist of countless multitudes of the hay bacillus matted together. What are we to conclude? Whence have these organisms come? The only interpretation is that the organisms *have come* from the germs of bacillus subtilis which have been shaken from the hay.

He then derides Bastian's interpretation that the dust of the hay is dead organic matter in a state of motor decay, saying: "This dead dust falls into the infusions, and although it does not commit the absurdity of becoming itself alive, it does go through the perfectly reasonable process of making the dead infusion alive." The value of such logic has been, he observes, duly appraised by the highest scientific authorities; its survival among the general public cannot last long.

Dr. Bastian, it will be remembered, asked, "What present warrant is there for supposing that a naked or almost naked speck of protoplasm can withstand four, six, or eight hours of boiling?" To which he answered, "None." On this point Tyndall first takes exception to the term naked protoplasm, and styles it "a creature of the respondent's fancy put into words," and further states that "not as a probable guess," "an assumption," or a "wild hypothesis," *but as an undoubted fact*, that the spores of the hay bacillus, when thoroughly desiccated by age, have, in special cases, withstood the ordeal mentioned. But, with a knowledge *that they are* germs, *they can be* destroyed by five minutes' boiling or less, by the following process: An infusion infected with the most powerfully resisting germs, but otherwise protected against the floating matter of the air, is gradually raised to the boiling-point. Such germs as have reached the soft or plastic state, immediately preceding their development into bacteria, are thus destroyed. The infusion is then placed aside in a warm room for ten to twelve hours. If for twenty-four hours, we might have the liquid charged with well-developed bacteria. To anticipate this at the end of ten to twelve hours, we raise the infusions a second time to the boiling temperature, which, as before, destroys all germs approaching their point of final development. This infusion is again put aside for ten to twelve hours, and the process of heating repeated. We thus kill the germs in the order of their resistance, and finally kill the last of them.

Finally, Professor Tyndall accuses "the respondent" of writing "*a reply*" on side issues only, and complains that no explanation is given why the guarded infusions remain free from living organisms. The evidence, observes Tyndall, against Dr. Bastian is immense, and the witnesses might be counted by the million, for every tin of preserved meat is an instance in which his instructions have been carried out, and which disprove his statements.

In conclusion, Tyndall says: "The present condition of this question is such that no medical man, seeking clearly to realize and effectually to remove the

causes of epidemic disease, need have his mind troubled by a doubt as to the derivation of those organisms to which modern physiology, with ever-increasing emphasis, assigns such momentous functions. Clearly assured that they are not spontaneous generations, his efforts will be directed to the discovery and the destruction of the germinal matter from which they spring. For their sakes I have spared no pains to render my demonstrations so clear that no amount of verbal 'effluence' will be able to obscure them. This accepted, the controversy comes to a natural end, for neither honor to the individual, nor usefulness to the public, is likely to accrue from its continuance, and life is too serious to be spent in hunting down in detail the protean errors of Dr. Bastian."

THE NEW MEDICAL BILL.

THE new medical bill, the text of which we reproduce in another column, is now before the State Senate Committee of Public Health. The question of medical legislation in this State is one that admits of careful consideration from many points of view. The present laws governing the practice of medicine are practically inoperative, and the first point that should demand the attention of the Legislature, is the advisability of any legislation whatsoever on the subject. In other words, is it conducive to the welfare of the people that the practice of medicine should be confined to those specially qualified for the purpose, or is it better that the lists should be open to all, whether qualified or not? The latter is practically the case at the present time. We leave for the Legislature to decide whether this is as it should be. America is perhaps the only civilized nation in the world in which such laxity is, as a rule, admitted. We make a few exceptions as regards some of the States in which laws of this character are in successful operation, but so much the more is it to be regretted that the Empire State should not be included in the list. It is true that safeguards are thrown about the practice of law, none being admitted to the courts, except they be graduates in law, and shall have passed an examination before a board appointed for the purpose. Are matters involving life and health of less consequence than those of liberty or property? As regards this particular bill, the requirements seem to be judicious and capable of enforcement. Although not ideally perfect in its provisions, it comes nearer that point than any previous legislation. The present state of affairs, far from protecting the people, really places a premium upon quackery, not only by offering facilities for the entrance of incompetent men into the profession, but by giving such fraudulent practices the stamp of legal authority.

DR. T. GALLARD, OF PARIS, FRANCE.—At a regular meeting of the New York Academy of Medicine, held March 7th, Dr. T. Gallard, of Paris, was elected corresponding member.

Reviews and Notices of Books.

THE ACTION OF MEDICINES. By ISAAC OTT, A.M., M.D., formerly Demonstrator of Experimental Physiology, University of Pennsylvania. Philadelphia, 1878. Lindsay & Blakiston. Pp. 168.

THE author's reputation as an experimental physiologist leads us to expect from him a well-written book. In some respects the volume before us meets with our hearty approval; in others we are disappointed.

The first part is decidedly the best; and three chapters upon the action of certain remedies upon the vascular and nervous systems, and the conduction of experiments upon animals, supply a place in the medical literature of the English language which has only been partially filled by the works of Wood. We cannot say as much for the last part of the work before us. It is but fragmentary, hastily written, and contains certain errors which we trust the author will correct in a subsequent edition. On page 113 he says: "In mitral obstruction the blood regurgitates into the pulmonary veins, the lungs become gorged with blood, aëration is imperfect, which causes dyspnœa. This obstruction causes the *right ventricle to have commencing hypertrophy.* If now the tricuspid becomes affected, then the veins are involved, and dropsy results. *Here digitalis does good by increasing the contractile power of the right ventricle.*" At a point a few lines below, the author says: "In disease of the *right side* of the heart, digitalis is of no avail." But one page is devoted to the action of strychnia, while four are given to the explanation of Ohm's law. In spite of these defects the book shows the author's familiarity with the subject he has chosen; and will, we trust, stimulate the profession to a more exact study of the effects of remedies.

1. MODERN MEDICAL THERAPEUTICS: A Compendium of Recent Formulæ and Specific Therapeutical Directions, etc. By GEO. H. NAPHEYS, A.M., M.D. Fifth edition, enlarged and revised. Philadelphia, 1878.
2. MODERN SURGICAL THERAPEUTICS: A Compendium of Current Formulæ, Approved Dressings, and Specific Methods for the Treatment of Surgical Diseases and Injuries. By GEO. H. NAPHEYS, A.M., M.D. Philadelphia: D. G. Brinton, 115 S. Seventh St., 1878.

THESE two works may be looked upon as companions to each other, inasmuch as the surgical volume grows out of the original medical therapeutics. The latter is a work very favorably known to the profession as a hand-book of actual medical practice, and the Surgical Therapeutics is upon the same model. The latter volume treats of the ordinary surgical diseases from a medical standpoint, and abounds in practical hints and suggestive prescriptions. Neither of the works can be looked upon as text-books, but merely as condensed manuals of practice, presenting facts from the experience of eminent practitioners here and abroad, with such comments only as are necessary for a proper appreciation of therapeutical points. No one in active practice can consult the pages of either volume without receiving some useful and suggestive hint, or without having his memory refreshed concerning some old and almost forgotten remedy.

MEDICAL ANNIVERSARY.—The one hundred and fifth anniversary of the Medical Society of London was celebrated on the eighth ultimo, with a dinner and addresses by Dr. Risdon Bennett and Mr. John Guy, of the College of Surgeons.

Reports of Hospitals.

NEW YORK CITY IDIOT ASYLUM, RANDALL'S ISLAND.

REFLEX PHENOMENA ASSOCIATED WITH GENITAL IRRITATION.

On Saturday, March 9th, Prof. Lewis A. Sayre, having had a steamboat placed at his disposal, by the Commissioners of Charities and Correction, for the purpose, proceeded to Randall's Island, accompanied by Commissioners Isaac H. Bailey and Townsend Cox, together with a number of medical experts and friends to whom invitations had been issued. When the party arrived at the island, they were met at the landing by Dr. J. C. Howard, physician in charge, and escorted to the Idiot Asylum, where they first had an opportunity of listening to some really excellent singing by about fifty of the children, who presented an appearance of cleanliness, neatness, and comparative intelligence which Dr. Sayre could not but remark was in most marked contrast to what was the case ten or twelve years ago.

Then passing to a private apartment, Dr. Sayre stated to the company present that he had come to visit the asylum in obedience to the request of the Commissioners.

In reply he stated that he had expressed his willingness to accede to the request, and, accordingly, had suggested the present date; while, with the permission of the Commissioners, he had invited the following gentlemen to accompany him: Drs. Meredith Clymer, E. C. Seguin, Fessenden N. Otis, A. E. Macdonald, Allan McLane Hamilton, George F. Shrady, B. F. Dawson, P. Brynberg Porter, Charles H. H. Sayre, and Cuttibach, of New York; Green, of Elizabeth, New Jersey; C. Van Bibber, of Baltimore; Nassau, of Burlington, Iowa; and Crenshaw, of Cadiz, Kentucky. Of this number, Drs. Clymer, Seguin, Shrady, and Dawson were unable to be present.

Dr. Sayre remarked that all mental improvement in the class of children found here must, of course, depend on the teaching which they received in the institution, but he had found that, in many such children, partial paralysis, lack of power of co-ordination, and apparent idiocy were dependent, in great part at least, upon some irritation of the genital organs. In males this was due to a constriction around the glans penis, producing continual priapism, the result of which was wasting and exhaustion of the nervous system sufficient to produce more or less paralysis, and, in some instances, complete loss of speech and of vision. In girls, on the other hand, much the same results were produced by an irritation of the clitoris, which was not uncommon. Therefore, notwithstanding however admirable might be their general management, a cure could not be hoped for in such cases until this source of irritation had been removed. Its action was precisely analogous to that of a thorn or other foreign body penetrating the tissues, where it was useless to expect relief as long as such foreign substance remained to keep up an irritation.

He was happy to state that in quite a number of instances he had been able to effect a proper cure simply by removing this source of irritation, and it was rather a curious circumstance that in the very last number of one of the journals, the *American Medical Bi-Weekly*, such a case had been reported by Dr. William N. Horne, of Yorktown, Indiana, a gentleman entirely unknown to him. On January 1, 1878, a male infant ten months old had been brought to him for treatment. The mother stated that for three or four weeks it had been losing the use of both upper and lower extremities, and had ceased to notice anything, while it had previously been a very lively child. Upon a careful examination of the infant, the doctor detected a lack of intelligence in the countenance, and great flaccidity of all the muscles, partial paralysis of the arms, and complete paralysis of the lower extremities. The prepuce was found to be preternaturally elongated and contracted, and the next day circumcision was performed. The attachments of the prepuce, which was closely adherent, having been torn loose, a quantity of smegma was disclosed behind the corona, and after this was removed, the frænum (which was much shortened), was cut. On the third of January the mother reported the child more like it used to be, putting its hand up to the breast and playing with it, a thing it had not done for some weeks. After this it rapidly recovered, and in two weeks was a well, stout child, able to stand by a chair, and with perfect control of all its muscles—no medicine whatever having been used in the case.

At the conclusion of Dr. Sayre's remarks, the party set out on a tour through the various buildings and wards of the institution. The first patient examined was a little girl, whose clitoris was found to be in a state of hypertrophy and irritation. Very little information could be obtained from the attendants in regard to her history or condition, but she lay with her legs crossed and seemed quite incapable of speaking coherently. Dr. Sayre recommended that she should be operated upon by the physician in charge.

In the second case, that of a young woman, there was also considerable irritation about the clitoris, and when sudden pressure was made upon it a marked spasm of the lower extremities, and notably of the toes, was instantaneously produced.

In the third case there did not seem to be any trouble about the genitals.

In the fourth patient, who was also nearly grown up, there was such rigidity of the tendons that it was almost impossible to produce flexion of the feet. In connection with this case, Dr. Sayre related that of a boy, thirteen years of age, who had recently been sent to him for treatment for club-foot, and who, being supposed to be hopelessly idiotic, was about to be sent to the training-school at Syracuse. On making an examination, he became convinced that the whole trouble was probably due to the condition of the penis, and having operated upon the prepuce, soon had the satisfaction of seeing the lad perfectly restored. He is now at a regular boarding-school, where he compares very favorably in mental and bodily vigor with any of the other boys in attendance there.

The fifth patient examined was a little girl whose clitoris was considerably inflamed, and here Dr. Sayre called particular attention to a white point surmounting it, which, he said, was composed of hypertrophied nervous tissue, and which acted like an electrical battery upon the lower extremities when it was irritated by the hand or otherwise. The child having been securely held by assistants, the clitoris was clipped with a pair of scissors, and the parts dressed with styptic cotton, the latter being held in position by a diaper. Dr. Howard was then requested to have her shoes and stockings put on, and a piece of lath, about a foot in length, secured between the feet, in order to prevent the irritating effect of the thighs in contact with the wounded surface. The portion of the clitoris thus removed was given to Dr. Hamilton for micro-

scopic examination, and Dr. Sayre stated that not infrequently there were no blood-vessels whatever found in this tissue.

The sixth case, a child of about the same age, presented a very marked contrast to the one just mentioned. Here there was no engorgement or enlargement about the clitoris, and the lower extremities were noticed to lie in a perfectly natural and easy position, no sensibility and no spasm being caused by pressure upon it.

In the seventh and eighth cases there was nothing abnormal about the genitals; so that there seemed to be no reason whatever for regarding the idiocy as attributable in any measure to the condition of these organs.

In the ninth patient, who was quite a pretty and intelligent-looking little girl of eight years, but who was evidently silly, distinct spasm of the lower extremities was produced by touching the clitoris.

In the tenth case there was slight, and in the eleventh (a girl fifteen years old), there was excessive sensibility.

There was nothing wrong noticeable about the twelfth, thirteenth, and fourteenth cases, except that there was a little redness seen in the thirteenth; but there was no crossing of the legs or other evidence of marked disturbance of the muscular or nervous systems.

The party now passed into the boys' wards, and here it was found that quite a large proportion of the children were of Jewish parentage, and had already been circumcised. While, however, circumcision had had no effect in averting idiocy in these cases, it was certainly worthy of note, as Dr. Sayre remarked, that none of the boys on whom the operation had been performed were suffering from want of co-ordination or any degree of paralysis; while some of those who had not been circumcised were more or less affected in this manner.

The first boy examined (the fifteenth case in regular order) was a little fellow of four years, about whose genitals there was found no source of trouble.

In the sixteenth case, however, a boy of eight, it was found that although the glans penis could be perfectly uncovered, there was behind it a constriction or girdle which nearly produced a paraphimosis. With the assistance of a grooved director passed up under the prepuce, this girdle, as well as the prepuce, was freely divided with a sharp-pointed bistoury. Styptic cotton was first applied, and then a piece of soft rag, which became adherent by means of the blood from the wound, after which a "bird's nest," or ring of twisted rags, through which a cold-water dressing could be laid over the head of the penis, was placed around the organ to protect it. Finally, in order to keep the whole in place, and to prevent the child from interfering with the dressing, a diaper was pinned on.

In the next thirteen cases examined there was no constriction, but in the fourteenth (the thirtieth of the series) the constriction was found to be very similar to that of the one just mentioned; and the same operation was performed, the same dressing being also applied.

Then followed two cases in which there was nothing wrong.

The thirty-third case was that of a lad thirteen years old, in whom there was an elongated and adherent prepuce, with a circle of hardened smegma just behind the corona.

In the next seven patients examined, there was no source of irritation about the penis.

The forty-first case was that of a boy upon whom some one had evidently operated previously; but, unfortunately, a redundancy of prepuce had been left, and this was now quite firmly adherent at the posterior portion of the glans. This was slit up and detached, and the frænum ruptured, after which the same dressing was applied as in the other cases.

In the forty-second case, there was no cause for interference; but in the forty-third there was found agglutination, but not adhesion proper, of the prepuce. There was no hardened smegma behind the corona.

The forty-fourth case was the most interesting one that had been seen up to that time, and was the only one as yet in which Dr. Sayre thought there was a chance of effecting much amelioration in the condition of the patient by means of operation. It was a boy, 7½ years old, who was very unsteady in his gait, and constantly falling down when he was walking or running. It was considered a fair sample of the class of cases in which the most relief can be afforded, and which call for circumcision proper in order to effect this. The prepuce was greatly elongated, and the orifice through which the urine had to pass exceedingly minute. The prepuce was snipped off with the scissors and turned back over the glans, and then the frænum having been torn with the fingers, the usual dressing was applied. In answer to a question put by one of the gentlemen present, as to how often this dressing should be changed, Dr. Sayre replied that it should not be changed at all, but allowed to remain about the parts until it dropped off. The only portion of it that was to be touched at all, was the rag over the glans, which was to be kept constantly wet for the first few hours.

The next case presented no point of interest in connection with the subject under investigation, but in the forty-sixth there was found a constricting girdle behind the glans, though there was no great redundancy of the prepuce. With the aid of a grooved director this band was thoroughly divided and the constriction relieved.

In the forty-seventh patient, an adult, there was found a certain amount of constriction, accompanied with a very extensive accumulation of smegma, and more or less priapism.

In the next six cases examined there was nothing abnormal about the genitals, except that the last of these patients (Case 53), had an exceedingly short frænum, causing marked deformity; and when this had been ruptured, the penis at once assumed a natural position.

The party now proceeded to the wards devoted to the most aggravated cases, and here the first patient examined in the male department was the well-known idiot, John Rouse (Case 54), who has such a striking resemblance to the so-called "Aztec children" who were on public exhibition a few years ago, and portraits of whom may be seen in Dalton's Physiology. Neither in him nor in the two succeeding cases, who were also grown up, was there any trouble about the genitals, and Dr. Sayre here made the remark that if they were only as well developed in their brains as they were in these parts, they certainly would not be inmates of an idiot asylum.

The next case (Number 57) was one of four (Number 44 being the first of these) which presented the greatest interest of the whole series. It was that of a boy seven or eight years old, who, according to the account given by the attendants, slept very poorly at night, and was constantly falling down when exercising. He was unable to talk, and always had to be fed; while his penis was in a state of half-erection

all the time. The prepuce was found to be elongated and adherent, and it was slit up upon a grooved director, after which the frænum was ruptured, and the usual dressing applied.

In the next three cases there was no cause for interference, while the fourth (Case 61) was the third of the four cases of greatest interest above alluded to. This patient was a boy of ten years, who suffered from constant priapism, and whose legs were covered with bruises caused by his continual falls. It was always necessary to feed him, and it was stated that he had never spoken a word in his life. He was operated upon in the same manner as Case 57.

There was nothing abnormal about the genitals of the next two cases examined.

The last ward visited was that occupied by females corresponding in mental condition to John Rouse and his fellows. There was no source of irritation about the genitals of the first patient examined, but the second, a little girl (Case 65), made the fourth of the interesting cases previously mentioned. It was found that she was in the habit of constantly slapping her head with the hands, that she usually lay with her legs crossed, and that both her arms and legs were black and blue on account of the numerous falls which she had had. She had never talked, and always had to be fed. On making an examination of the genitals, it was ascertained that the clitoris was hypertrophied and greatly irritated, and that when pressure was made upon it, instantaneous spasm of the muscles of the thighs and legs was produced, the effect being, apparently, very much like that of an electric shock passing down through the lower extremities. The upper part of the clitoris was clipped with the scissors in the same manner, and the same dressing applied as in Case Number 5.

The sixty-sixth patient examined was a grown-up girl, who gave evidence of very amorous tendencies, but in this case all sensibility of the clitoris had been destroyed by the constant handling to which the parts had been subjected. Dr. Sayre expressed it as decidedly his opinion that masturbation was frequently caused by the pre-existing irritation about the genitals, and that the latter was not ordinarily due to masturbation, as held by some authorities.

The sixty-seventh case presented no point of interest.

At the conclusion of the examination of the patients, Dr. Sayre expressed his obligations to the Commissioners of Charities and Correction for their courtesy on this occasion, and his deep appreciation of their desire to thus aid in the investigation of scientific truth. Even should no practical results ensue from this visit to the Idiot Asylum, they would at least have the consciousness of having done what they could for the advancement of medical science and the benefit of suffering humanity. Finally, he wished to offer his particular and personal acknowledgments to Commissioner Cox, through whose instrumentality the investigation had been brought about. The case of club-foot combined with idiocy, to which he had previously alluded, had been sent to him by Mr. Cox, and it was owing to the happy results obtained in that instance by the surgical removal of the source of irritation, that the opportunity for the present examination had been afforded.

Drs. Otis and Macdonald both expressed the opinion that enough had already been shown by this series of observations to warrant the recommendation that in all idiot and lunatic asylums, circumcision should be performed in all cases where there is an elongated or constricted prepuce, as a preliminary to any treatment in the institution.

A careful record of the cases operated upon will be kept by Dr. Howard, and the results made known at some future time.

Correspondence.

ULTIMATE RESULTS OF EXCISION OF HIP-JOINT.

To the Editor of The Medical Record.

Sir:—Dr. Sayre took occasion to say publicly at a meeting of the Medical Journal Association that eight cases upon which he had operated "had been discharged from the Hospital for the Ruptured and Crippled as incurable," and that under his hands seven of these "had made a good recovery."

Under other circumstances this attack might, with propriety, have been passed unnoticed, but in this instance it was upon the reputation of a public institution in which a large number of our most wealthy and charitable citizens are interested; the character of the gentleman making the charge or statement was, also, exceptional, and a denial seemed to be necessary. It was made in the number of your journal for March 16th by myself, one of the medical officers of said institution. To this communication Dr. Sayre has replied in the number of the same journal for March 23d.

Waiving for the present all questions or issues which may have since arisen, it will appear, from his own admissions contained in his reply to my denial, but not in his original statement, that Dr. Sayre made the declaration that these eight were discharged as incurable, upon no other authority than the statements of "the patients themselves and their friends." Dr. Knight and myself, to whom Dr. Sayre refers as having had charge of these patients, deny, first, that all of these eight were ever inmates of the hospital; second, that any of them were ever discharged as incurable. As against the testimony of the patients themselves, therefore, and of their friends, we offer our own testimony and the actual condition of the patients at the time of their removal (such as were ever in the hospital) as given in my first letter, and we shall accept the verdict of an intelligent profession as to which testimony ought to have the most weight.

We shall permit ourselves to say, however, that, if the statements of patients and their friends were always competent testimony, we would have it in our power to materially injure the reputation of many surgeons; for not a day passes but patients declare that they have been "given up" by their medical attendant as "incurable." We have learned, however, that such statements are seldom reliable, or worthy of a moment's attention.

In the second statement made by Dr. Sayre, viz., that under his hands seven of the eight were cured—"made a good recovery"—we have an interest only in common with all others. It would be much easier for Dr. Sayre to ascertain the facts than for us, yet so far as we can learn, he has not ascertained the facts fully; but the information I have thus far obtained seems to show that *one* "has made a good recovery," possibly, three, certainly not *seven;* and that *two* instead of *one*, as stated by Dr. Sayre, have died "from exhaustion."

In saying "possibly three" have made a good recovery, we include, for argument's sake, Chas. Smith, who, in our opinion, was never a hospital patient. If he was it would be easy, we suppose, for Dr. Sayre to establish that fact. The parents ought to have the

dispensary card. The condition of the boy is described by Dr. Sayre* at the time of the operation: "Five fistulous openings, one of them in the groin. Very much run down from *want of proper food and good air*" (my italics). With all the sins laid at our door, we are not charged with "want of proper food and good air." We include, also, in the "possibly three" the child of Mr. Potter, who was never a hospital patient, but Dr. Knight's private patient, being brought from Newport, R. I., at each visit, as stated in my last, and never discharged by him as incurable. We have reason to believe that he is not cured. As evidence that he is cured, Dr. Sayre read to me extracts from a letter, but he did not, as he affirms, "allow him [me] to read it." In the portions read to me the writer spoke of the boy as taking quinine, and of being in search of baths beneficial to patients with hip-disease. I asked Dr. Sayre whether he was giving the quinine for malarial poisoning, and he said "yes." The words "malaria" or "malarial poisoning" were not in the letter, as Dr. Sayre truthfully states. I have *never said* they were. When Dr. S. published portions of this letter he omitted what was said about baths and quinine. For what reason? I do not believe, however, that the wound is closed or was closed up to the latter part of January, 1878. From reliable information received since the date of my last publication, I am justified in this disbelief. I am not aware that Dr. Sayre has ever stated publicly that the wound in this individual case is healed. It occurs to me that the profession would like this question answered definitely before accepting the case as one of "good recovery."

Certainly the fact is well known to medical men that a boy may have diseased bone and fistulous openings before and after excision, and yet may "prove an admirable sailor," may "*never be ill a moment*" (crossing the ocean), may be "up on deck every day," may ride out sometimes in an open carriage and sometimes go on a donkey"—"enjoy it very much" too—may send "his love" to the doctor and say "he is very well." This is the information contained in the letter as published.

A word in regard to certain new issues; I mean issues not contained in Dr. Sayre's first public statement. He says the fact that they were all incurable without an operation is sufficiently established by the character of the surgeons who were present at the operations, and gave their approval and assistance. I am not aware that any one has called in question the propriety of the operations made by Dr. Sayre. I am in no position to decide that point, since all such patients ever treated in the hospital had been withdrawn months before the operations were performed, and in the meantime they may have become better or worse—may have "run down from want of proper food and good air." One was not operated on for ten months; one, three months; two, five months; two, nine months; and one at least thirteen months. If, therefore, Dr. Sayre means by the testimony to prove that they were all in a condition demanding excision when they left us, we deny that the testimony is conclusive, or even presumptive, and it is unscientific to offer it as such.

Dr. Sayre says there is a discrepancy or two which he asks me to explain: I said in my first paper "all who were ever treated here are indexed," and in reference to Mr. Potter's child I said "he was never treated as an in-patient of the hospital, and I find no record of his case." In the following lines I add that Dr. Knight has a distinct recollection of the case. The child was, in fact, brought that he might be a private patient, the circumstances of the parents being such that they would never have thought of making him an hospital patient. Dr. Knight objected to treating the boy at so great a distance from the city, and the term "out-door patient" used by me was not intended to convey the idea that he was in any sense a hospital patient. For this reason his name was not recorded.

Having made my explanation now, as requested, would it not be well for Dr. Sayre also to explain why, in quoting my printed language ("all who were ever *treated* here are indexed"), to prove me guilty of a "contradiction," the word "treated" is omitted, and I am reported as saying "*all* who were ever here are *indexed?*" I concur with Dr. Sayre in his appeal contained in his last note, that "the profession may suspend their judgment" until the facts are known.

With much respect,

V. P. GIBNEY.

135 E. 42d St., March 26, 1878.

* Medical Record, Vol. xi., p. 336.

THE COMMITMENT OF THE INSANE.

MISS DICKIE'S CASE.

TO THE EDITOR OF THE MEDICAL RECORD.

SIR:—The balance of the testimony is in favor of the view that this lady not only was, but is insane. She was committed upon the testimony, among others, of Dr. Alfred C. Post, who still believes her deranged. She was accepted as such by Dr. Tilden Brown, in whom we all have confidence. The present Superintendent, Dr. Nichols, has no doubt that she is insane, and that the person who may be appointed her guardian will soon discover the mistake of taking her out of the asylum. This prediction it is said has not only already proved true, but that one of the so-called experts who testified to her sanity had previously given an opposite opinion. Dr. McDonald, who has had charge of her longer than any other person, says if she is found to be really insane, he is willing to share the blame with Dr. Ramsey, who used to visit her there, and acquiesced in her detention, of permitting her to remain so long in the asylum. Up to the latest moment before her discharge she was constantly annoyed by whispers, which came to her through the waste-pipes from the stories above and below her, and believed that persons were sent to these places especially to annoy her. She has several times supposed that she was going to be married to a person who gave her no encouragement, has fixed several different days for her wedding, ordered her marriage paraphernalia, and sent out cards of invitation. She is so very small that her fits of rage do not amount to much, and she can be easily controlled; but she has the usual insane dislike to all her relatives and friends, and prefers strangers who pander to her infirmities.

The whole proceedings in her case by the judge, jury, commissioners, lawyers, and experts, were either founded upon the grossest ignorance, or culpable prejudice. The judge's charge was only a step above a newspaper sensation.

AN ACT TO BETTER REGULATE THE PRACTICE OF PHYSIC AND SURGERY IN THE STATE OF NEW YORK.— The People of the State of New York represented in Senate and Assembly do enact as follows:

§ 1. Every person now lawfully engaged in the practice of physic and surgery in the State of New York shall, on or before the first day of October, 1878, and every person subsequent to the date of the passage of this act, commencing the lawful practice of physic and surgery in the State of New York, shall register his name in full, the place of his residence, the place of his birth, the character of his qualifications, whether diploma, license, or certificate, the date of said diploma, license, or certificate, and the name of the society, college, or body granting the same, in a book kept for such purpose by the clerk of the county in which such person resides or practices at the office of such clerk. Such registration shall be made under oath before a notary public, who shall also affix his name thereto. Each county clerk in the State shall provide a book to be kept for said purpose in his office, and said clerk shall receive a fee of twenty-five cents for each name registered therein, to be paid by the person so registering. And said book is to be kept open for the inspection of the public during business hours.

§ 2. It shall be the duty of the censors of each incorporated county medical society to inspect said book, kept in the county of his residence, during the first week of October and April in each and every year, and to record their names therein at the time of such inspection, as evidence of such inspection having been made.

§ 3. It is hereby declared a misdemeanor for any person, excepting those now lawfully engaged in the practice of physic and surgery in the State of New York, to practice physic and surgery in the State of New York unless such person shall have lawfully obtained the degree of doctor of medicine from some one of the incorporated medical colleges in the United States or from the Regents of the University of the State of New York, pursuant to Chapter 746 of the Laws of 1872.

§ 4. A violation of the provisions of Section 1 of this Act is hereby declared to be a misdemeanor.

§ 5. Any person found guilty of a violation of the provisions of Section 3 of this Act shall be deemed guilty of a misdemeanor, and shall for the first offence be fined not less than two hundred dollars nor more than three hundred dollars, and shall be imprisoned until such fine be paid, and, in addition to such fine, such person may be sentenced to imprisonment for a term not exceeding six months. And for any subsequent offence said person shall be fined not less than four hundred dollars, nor more than six hundred dollars, and shall be imprisoned until such fine be paid, and, in addition to such fine, such person may be sentenced to imprisonment for a term not exceeding eighteen months. Such terms of imprisonment are, however, subject to the terms of limitation prescribed by the provisions of Chapter 61 of the Laws of 1876. One-half of all such fines shall be paid to the president of the medical society making the complaint, for the uses of the society.

§ 6. Proceedings for a violation of the provisions of this Act may be instituted by the president of any one of the incorporated county medical societies of the county in which the offence was committed on his written complaint. Said complaint, together with the affidavits upon which the warrant is granted, must be sworn to before a police justice or a notary public. Proof of the fact of a demand having been made on the person accused for the production of his diploma by the President of the Board of Censors of the County Medical Society, the President of which Society makes the complaint, and of the refusal or failure of the accused to make such production, shall be for the purposes of the proceedings before the police magistrate, *prima facie* evidence of the guilt of the accused.

§ 7. The Act of May 11, 1874, regulating the practice of medicine and surgery in the State of New York, is hereby repealed.

TALKING MACHINE.—Mr. Edison, by this invention, has done for sound what Daguerre did for light—made it possible to fix and permanently retain the most fleeting impressions. We pointed out, last month, the marvellous capacities of cold iron, magnetism, and an electric wire; but the capacities of the phonograph are still more marvellous, for, with only a vibrating plate, a sheet of tin-foil, and a crank, it is possible to arrest and fix all kinds of sound, and, having preserved them as long as metals will hold their properties, to give them forth again in all their original qualities. The voice, indeed, is somewhat muffled and minified when returned from the iron tongue of the phonograph; but its intonations, inflections, pauses, and quality are rendered with surprising fidelity. By the simple turning of the crank, the machine talks, sings, shouts, laughs, whistles, and coughs, so naturally and distinctly, that the listener can hardly believe his senses, or escape from the suspicion that there is some ventriloquist hocus-pocus about it, or a little fellow concealed somewhere about the arrangement. But the fact is established, and must be made the most of. A machine, as simple as a coffee-mill, hears a speech or a song, and gives it back as perfectly as it was at first uttered by the living organs of voice. And so, again, we have the lesson repeated, with still greater emphasis, that we must raise our estimate of the powers and potencies of "mere dead matter."—PROF. YOUMANS, *in Popular Science Monthly for April.*

PROF. D. W. YANDELL, OF LOUISVILLE, KY.—During his visit to this city, on his way to Europe, this distinguished gentleman has been the guest of Prof. F. J. Bumstead, and has been the recipient of many hospitalities from his numerous friends. On the eve of his departure (Tuesday) Dr. Bumstead tendered him a brilliant reception, at which was present a large number of representative medical men.

BROWN-SÉQUARD'S TREATMENT OF EPILEPSY.—Our attention has been called to a formula of Brown-Séquard, which is claimed to have been used by Dr. Ayer, and which is given in *Boston Surg. Journ.*, Dec. 27, 1877, and copied by us in our issue of Feb. 9, 1878. There seems to be an error in the prescription. The original formula stood *iodidi bromidi*, and in our issue as *iodinii bromidi*, the dose of which, if ever ad-

ministered in medicine, appears to be excessive. We beg of our readers not to make use of the formula until we have investigated it more fully.

HELMINTHOLOGY.—Important additions have been made to this science during the past year, and the necessity for more extended investigations is evident. An epidemic of diarrhœa was traced to the presence of two nematode worms (Anguillula stercoralis and A. intestinalis). In Italy, good work has been done, tending to prove the great tenacity of life of those organisms giving rise to the pork and beef measles, Dr. Payne and several students having courageously submitted themselves to experiment, and infecting themselves with "Tænia medio-canellata." A more recent discovery in helminthology has important relation to the origin of many obscure diseases. It appears that a Mr. Bancroft wrote from Brisbane in April, 1877, and incidentally remarked: "I wonder if mosquitoes could suck up the hæmatozoa and convey them to water? They appear to die in water. I will examine some mosquitoes that have bitten a patient, to see if they suck up the "filariæ." At the time "Bancroft" was surmising, Dr. Manson, of India, demonstrated this to be a fact. In November, 1877, Dr. Manson wrote to Dr. Spencer Cobbold, the eminent helminthologist, announcing the discovery of this parasite in the stomachs of the mosquitoes, which had fed on hæmatozoal patients, describing also the developmental changes it undergoes during its residence in the insect.

He also supplements the fifteen cases of this human hæmatozoa, giving details of no less than thirty-five additional cases, and a mass of valuable statistics in relation to the prevalence of "*Filaria sanguinis hominis.*" Thus, what the Russian traveller Tedscheuko showed in relation to the case of the "cyclops," considered as the host of the Guinea worm, Manson has shown to obtain in the case of the "Culex mosquito." True, there was a difference in detail, but both play the rôle of intermediate bearer, the little crustacean and the small mosquito. Dr. Cobbold, as a practical comment on these discoveries, well remarks that "if physicians will only reflect to what extent diseases hitherto obscure are to be associated with the bite of a gnat, they will, perhaps, be not less ready than hitherto to extend a helping hand to those who, at great sacrifice, labor in the fields of helminthology."

BACTERIA.—Dr. Arthur Downes and Mr. T. P. Blunt presented to the Royal Society (England) the result of some very interesting observations on the effect of light upon bacteria and other organisms. The experiments were carried out in great detail, and their record is too lengthy to be given in full. The deductions to be drawn may be summed up as follows: 1. Light is inimical to the development of bacteria and the microscopic fungi associated with putrefaction and decay, its action on the latter organisms being apparently less rapid than upon the former. 2. Under favorable conditions it wholly prevents that development, but under less favorable ones it may only retard. 3. The preservative quality of light, as might be expected, is most powerful in the direct solar rays, but can be demonstrated to exist in ordinary diffused daylight. 4. So far as the investigation has gone, it would appear that it is chiefly, but perhaps not entirely, associated with the actinic rays of the spectrum. 5. The fitness of a cultivative fluid to act as a nidus is not impaired by insulation. 6. The germs originally present in such a liquid may be wholly destroyed, and a putrescible fluid perfectly preserved by the unaided action of light.

In the course of the investigations it was observed that when bacteria appeared early and in large numbers in the solutions used, the mycelium of penicillium, or other microscopic fungi was rarely seen, the bacteria apparently preoccupying the ground; when, however, the development of bacteria was from some cause retarded or prevented, tufts of delicate mycelium were frequently found in the solutions after they had been incased or removed into diffused light. No mycelium, however, appeared during the period of exposure of a solution, except under certain conditions, nor indeed afterwards if this was sufficiently prolonged.

These gentlemen, therefore, infer that light may retard, or altogether prevent, the appearance of mycelial fungi, but that its influence in this respect is slower and less powerful than upon the schizomycetes. They also suggest that this may explain, in part at least, the sparing distribution of bacteria in ordinary air, as compared with the prevalence of the spores of penicillium, etc., a fact observed by Burdon Sanderson and others.

POSITION IN LABOR WITH A BREECH-PRESENTATION.—Dr. J. M. Ward, of Cornelia, Missouri, writes: "Some twenty years ago I met with my first case of breech-presentation, and I was so unfortunate as to lose the child. I thought that I ought to have done better, and so determined to do in future cases, notwithstanding the authorities state that one in three die. I was not long in waiting for an opportunity, and when the case had so far proceeded that the breech would likely be delivered at the next pain, I placed the woman on her knees with the breast resting on the head-board of the bed, which was high enough to place the body at an angle of 45°.

"I found that I had gained a great deal over the method of delivery on the left side or back, as the woman could exert more force aided by gravitation, and then there was the best possible chance to give effective assistance. The result has been that I have never failed to save the child since I adopted that method, and I believe it should be the rule in obstetric practice. Physicians to whom I have communicated the idea approve it, and wonder that they had not been taught so simple a procedure."

MORTALITY IN ST. PETERSBURG.—St. Petersburg, according to recent vital statistics, is, with a single exception, the unhealthiest city in the world, official returns giving the death-rate as 57 per 1,000, against 24 per 1,000 in London, and 20 in New York, 36 per 1,000 in Calcutta, 38 per 1,000 in Turin, 39 in Naples, 40 in Alexandria, 41 in Bombay, 27 in Edinburgh, 33 in Dublin, and 30 in Liverpool. The rate at Madras is 101.

BRITISH PRIZE AWARDS.—The Fothergill gold medal for 1878, of the London Medical Society, has been awarded to Dr. J. Milner Fothergill for the best essay on the "Antagonism of Therapeutic Agents." The silver medal for the best paper read during the last session, was awarded to Dr. J. Althaus, for a paper on "Disease of the Anterior Cornua of the Cord."

DEFECTIVE DRAINAGE AND DIPHTHERIA.—The sometimes strongly argued causal relation of defective drainage to diphtheria has received a striking illustration in a recent report of the Medical Officer of Health for Hackney, England, who describes the late serious outbreak at Upper Clapton. A personal inspection of the houses in which the cases occurred showed that in every instance save one, the overflow

pipes of the cisterns were connected with the drains, so that sewer gas could readily obtain admission to the house. In one case no less than five pipes emptied themselves into the drains without being trapped, so that sewer gas came up the waste-pipe of a fixed wash-basin whenever the plug was taken out.

STRUCTURE OF SPERMATOZOA IN MAN.—In a paper read before the Sixth Congress of German Surgeons, Dr. A. Menzel records some observations upon the milky fluid taken from a spermatocele, from which it appears that the spermatozoa in man exhibit, under certain circumstances, a very distinct transverse striation. The sperm-cell he finds to exhibit very lively movements, and to show a disposition to throw out long filiform processes. The seminal animalcules, it seems, proceed without exception from the nuclei, and never from the protoplasm of the cells.

MORTALITY FROM SMALL-POX IN LONDON.—The *Lancet* furnishes some interesting statistics as to the mortality from small-pox last year in the hospitals of London, from which it appears that 6,728 cases were admitted, and the whole number recorded was 7,242, of whom 1,284 died and 5,958 recovered. During the epidemic of 1870–71–72, the number of cases treated was 14,808, with a rate of mortality of 18.7 per centum. Last year the rate was 17.7 per cent., but varied greatly at different seasons, being for the first quarter 19.7, for the second 16.4, for the third 10.9, and for the fourth 29.6.

TREATMENT OF OPIUM-POISONING WITH ATROPINE.—At a recent meeting of the Medical Society of London, Dr. Milner Fothergill related an interesting case of opium-poisoning successfully treated with hypodermic injection of atropine. The patient had taken the equivalent, in laudanum, for twelve grains of opium. Three hours after taking the dose, Dr. Fothergill saw the woman, and immediately administered, by injection, a solution containing one grain of atropia sulphate.

MEDICAL OBLIGATION IN RUSSIA.—A strong agitation has been set on foot in Russia to procure the abrogation of a law that compels a physician to attend any one who may call for his services, and subjects him, in case of refusal, to a fine of from five to ten roubles for the first, ten to fifteen for the second, and fifty to one hundred for the third offence. In 1869 a similar law was repealed in Prussia.

DIAGNOSIS OF BRAIN TUMORS.—Dr. Dreschfeld, in the course of a valuable paper on the diagnosis of tumors of the brain, observes that, when situated in the cortical portion of the ascending parietal and ascending frontal convolutions, the symptoms correspond to those produced by lesion of the striated bodies; while, if situated in the anterior lobes, the phenomena are more strictly psychical. In lesion of either of these regions convulsions or epileptiform seizures supervene, but when the tumor is in the first-mentioned situation, the attacks are always preceded by an aura, whereas, when in the latter situation, no aura occurs. Vomiting is not common in lesions of the anterior lobes. On the other hand, optic neuritis is frequent, cephalalgia is a persistent symptom.

AWARD OF THE MARSHALL HALL DIPLOMA.—At the last annual meeting of the Royal Medical and Chirurgical Society of London, the diploma of the Marshall Hall prize was conferred upon Dr. John Hughlings-Jackson for distinguished contributions to the medical knowledge of aphasia, to the clinical relations of epilepsy, and to the physiology of the brain. This is the first instance in which this honorary diploma has been conferred.

DIPHTHERIA IN PARIS.—From statistics collated by *Le Progrès Médical*, it appears that the mortality from diphtheria has more than doubled in Paris since 1872, when the disease was responsible for 1,135. In 1873, the number rose to 1,164, but fell in 1874 to 1,008. In 1875 it was 1,328; in 1876 it had risen to 1,571; last year, to 2,393. Density of population has little, if any, influence in determining the disease; but poverty, observes M. Besnier, is very distinctly concerned in promoting its development.

RELATION TO LIFE OF AEROSTATIC PRESSURE.—The notion that the fatal effects experienced from exposure to a highly rarefied atmosphere is caused by the diminished pressure, is disputed by Prof. Paul Bert, of Paris, in an essay which has been awarded the great prize, issued every two years by the Institute of France. By an ingenious series of experiments, Prof. Bert shows that when a bird, placed under a bell-glass from which the air is gradually exhausted, commences to exhibit symptoms of dissolution, it may be immediately restored by the addition of a little pure oxygen to the highly rarefied medium; while by continuing the action of the air-pump, as well as the admission of oxygen, the rarefaction may be kept at a standard supposed to be sufficient to cause death, without resulting in serious inconvenience to the animal. After having experimented upon various animals, Prof. Bert placed himself within a large cylinder, with the nozzle of an oxygen bag in his hand, and caused the air to be slowly exhausted. At the expiration of twenty-one minutes, with a barometrical pressure of 590 millimetres, his pulse was 70. At the expiration of thirty-five minutes, with a pressure equivalent to that of 13,000 feet above the sea-level, his pulse was 84, and a feeling of nausea nearly overcame him. Two minutes later the nausea disappeared, the abdomen became a little swollen, and signs of congestion appeared in the face. After being in the cylinder two hours and forty minutes, the pressure being 430 millimetres, and the pulse 84, he took three whiffs of oxygen, and the pulse instantly descended to 78. Four minutes later, he inhaled more oxygen, the disagreeable symptoms vanished, and the pulse went down to 70. In another curious series of experiments, the professor finds that aerostatic pressure, even of oxygen itself, extinguishes life, and is destructive to organic compounds. Ferment organisms, such as bacteria, are almost instantly killed by the action of compressed air, or of compressed oxygen gas, while fermentations due to dissolved matter, such as diastose, perfectly resist the influence of atmospheric pressure. The ripening of fruit being arrested by compressed oxygen, Prof. Bert concludes that the phenomenon is one of cellular evolution. The poison of the scorpion, on the contrary, wholly resisting the action of increased aerostatic pressure, he concludes to be due to the pressure of compounds similar to the vegetable alkaloids. Fresh vaccine lymph, after having been subjected to the pressure of 50 atmospheres for a week, retained its virtue; and Prof. Bert concludes from this fact, that its active principle is not the cell found in it, as many have supposed. The poison of glanders remained active after similar treatment, and carbunculus blood, though freed from bacteria by aerostatic pressure, still retained its dangerous properties. He concludes, therefore, that the bacteria, germs, cells, penicilium spores, etc., found in these poisons, are not the cause of their virulence.

TO ADVERTISERS.—Permit us to direct your attention to "THE MEDICAL RECORD." It has now been published over twelve years, and has become the most popular and most extensively read of any medical journal in America. Its circulation is widespread over the entire continent—probably there are few of the active, intelligent members of the Profession who are not among its regular readers. The value to Advertisers of this large list of subscribers has long been recognized, as practically shown by the great number of pages of advertisements, rendered necessary by the patronage of those who have found that

IT PAYS TO ADVERTISE IN THE MEDICAL RECORD.

THE MEDICAL RECORD HAS THE LARGEST CIRCULATION OF ANY JOURNAL OF ITS KIND IN AMERICA.

Issues over 800,000 a Year.

ITS CIRCULATION IS WELL DISTRIBUTED OVER THE NORTH, SOUTH, EAST AND WEST.

Recent Testimony of Experienced Medical Advertisers who have Tried it.

GENTLEMEN:—Having advertised for a term of about two years in THE MEDICAL RECORD, I cheerfully express to you my appreciation of its value. Its high professional standing entitles it to the first place as an advertising medium, and the results I have obtained for all my goods through it, verify this. I likewise consider its rates, in proportion of the number of copies which it distributes to the best class of the medical profession, as cheaper by far than most all the so-called, low-priced papers. Very truly yours, F. ALFRED REICHARDT, Pharmacist.
NEW YORK, *January* 30, 1878.

GENTLEMEN:—The results obtained by our advertising in THE MEDICAL RECORD have been very satisfactory, and we cheerfully recommend it as being one of the best mediums for reaching physicians. Yours truly, W. H. SCHIEFFELIN & Co.
NEW YORK, *January* 31, 1878.

GENTLEMEN:—We have renewed our contracts with you this year, as we are well satisfied with our advertisements in your MEDICAL RECORD, which have extended over a number of years. We believe the RECORD to be very ably edited, and its large subscription list of physicians is well merited. Yours respectfully, MCKESSON & ROBBINS.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—Having advertised in THE MEDICAL RECORD almost continuously from the time it was first published, we consider it the best medium for reaching the medical profession of this country. Yours respectfully, CASWELL, HAZARD & Co.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—It gives us great pleasure to speak of the merits of THE MEDICAL RECORD. The able manner in which it is edited and managed give it a wide influence amongst the medical profession of this country. Sincerely yours, WM. R. WARNER & Co.
PHILADELPHIA, *February* 5, 1878.

GENTLEMEN:—Continued advertisement in THE MEDICAL RECORD, lead us to say that we regard it as the *best* journal for reaching the medical profession that we know of, owing to its wide circulation and the thorough manner in which it is circulated. Yours truly,
PHILADELPHIA, *February* 5, 1878. KEASBEY & MATTISON.

GENTLEMEN:—During the time we have had our advertisement in THE MEDICAL RECORD we have found it to be the very best advertising medium, and we beg to say that we cannot recommend it too highly. We have had more orders in consequence of our advertisement in THE MEDICAL RECORD than from all other journals we advertise in combined.
NEW YORK, *January* 30, 1878. F. G. OTTO & SONS, New York.

GENTLEMEN:—Having advertised in THE MEDICAL RECORD for a number of years, we can confidently recommend it to advertisers as one of the best mediums known to us.
NEW YORK, *January* 30, 1878. Yours respectfully, GEO. TIEMANN & Co.

GENTLEMEN:—As constant advertisers in THE MEDICAL RECORD, we are happy to state that we consider the RECORD one of the very best mediums for reaching the medical profession.
NEW YORK, *January* 28, 1878. We are yours truly, E. FOUGERA & Co.

GENTLEMEN:—Your MEDICAL RECORD has been very satisfactory as an advertising medium; nearly every mail bringing orders and inquiries from its readers. From letters received, the "RECORD" must reach all quarters of the globe. Yours truly, A. J. DITMAN, Druggist.
NEW YORK, *January* 28, 1878.

GENTLEMEN:—We are entirely satisfied with the results of advertising in THE MEDICAL RECORD. There is no better medium for reaching the medical profession in the United States.
Very respectfully, TROMMER EXTRACT OF MALT Co.
FREMONT, OHIO, *February* 10, 1878.

Office of McKESSON & ROBBINS,

IMPORTERS, WHOLESALE DRUGGISTS & MAN'F'G CHEMISTS,

91, 93 Fulton Street & 82, 84 Ann Street, N. Y.

As the extreme scarcity of Quinine both in Europe and America will probably not be relieved until summer, and manufacturers have been unable to supply our wants, we have been obliged to again advance our list of Quinine Pills, as below.

Since we changed, last fall, from Unbleached to Bleached Quinine in the manufacture of our Pills, we have heard from a large number of druggists and physicians stating that the therapeutical effects of the dark pills were better than the "bleached," dose for dose, where a tonic was indicated, and the antiperiodic effects of the former were as well marked. We made the change because we were disappointed in obtaining a uniform article of unbleached Quinine, were deceived in two shipments we received and the analyses of samples from the same package we submitted to different highly reputable chemists varied surprisingly, in fact, analysing Quinine *quantitively* is very difficult, as it depends very largely upon the different solubilities of the alkaloids in water, while the *qualitative* analysis is very simple and reliable.

The curative properties of the other alkaloids of Cinchona Barks have been well attested and the effect of the **combined alkaloids** has been repeatedly asserted to be greater than that of any **one alone.**

In view of these facts, we accordingly propose to offer Pills made of Hospital Quinine, which differs from that which has been known and understood as "unbleached," in the process of manufacture and in the proportion of Quinine. This Hospital Quinine will contain about 50 per cent. of Quinine Sulphate, and the balance, Cinchonidia Sulphate and traces of Quinidia Sulphate; the Cinchonia Sulphate, being less powerful than the other alkaloids is separated.

These pills on account of their lower price will relieve a difficulty, to which a large number of people living in malarious districts have been subjected—the inability to purchase Quinine Pills on account of price, especially when scarcity causes sudden and great advances, as at present—at the same time we believe that confidence may be felt in experiencing equal relief with similar doses.

We will continue, as now, to make our "Quinine Pills" of bleached Quinine, and the white color will readily identify them from our darker Hospital Quinines, which will be labelled "Hospital Quinine." The list of Hospital Quinine Pills we submit below is subject to same discount as our other pills, and will be reduced as soon as the market on Quinine will allow. We call special attention to our Pills of Cinchona Bark Alkaloids, which contain a definite quantity of each of the four alkaloids, one half grain each Sulphates Quinia, Quinidia, Cinchonia and Cinchonidia.

We annex below list of our Pills of other Cinchona Alkaloids, and remain, soliciting your correspondence and valued orders,

Yours respectfully,

March 27th, 1878.

McKESSON & ROBBINS.

To Physicians—An ENTIRELY NEW and IMPORTANT REMEDY for CONSUMPTION.

PHILLIPS' "PALATABLE"

COD LIVER OIL

IN COMBINATION WITH

PHOSPHO-NUTRITINE

(A NEW AND IMPORTANT PREPARATION OF THE SOLUBLE WHEAT PHOSPHATES).

This article is offered to the Medical Profession as HAVING ESPECIAL ADVANTAGES OVER ANY AND ALL OF THE COD LIVER OIL PREPARATIONS for the cure of CONSUMPTION, EMACIATION, COUGHS and all PULMONARY COMPLAINTS. The vast importance of the PHOSPHO-NUTRITINE will be perceived in giving to this preparation the HIGHLY-NUTRITIOUS and TONIC properties of the PHOSPHATES exactly as nature provides them, greater NOURISHING, STIMULATING and BUILDING POWER being thereby added, and which not only renders it PALATABLE, LIMPID and EASY OF ASSIMILATION, but ENTIRELY REMOVES ALL NAUSEOUS TASTE AND SMELL, and, unlike any other Cod Liver Oil Compound, is miscible with, and should be taken in water. ITS TASTE IS ACCEPTABLE TO THE MOST SENSITIVE and DELICATE STOMACH.

Prepared only by CHAS. H. PHILLIPS, Manufacturing Chemist,

Explanatory Circular mailed on application.

(P. O. Box 4,517), 2 and 4 Platt Street, New York.

Peck's Cod-Liver Oil and Wild-Cherry Bark.

Unequalled for rapid and efficient action in **Phthisis, Deficient Nutrition, etc.** Agrees with the most delicate stomach, never causes eructations, is a positive tonic. Its taste is far more agreeable than that of any other combination. It is a perfect emulsion of fifty per cent. of oil and twenty-five per cent. of bark, from which the oil does not separate, and which keeps indefinitely without change.

Dr. W. L. ATLEE, Jr., Philadelphia, writes:—"I have used your Ol. Morrh. cum Prun. Virg. in upwards of a hundred cases. The results were invariably satisfactory and very much better than I ever obtained with other preparations of Cod-Liver Oil."

Peck's Elixir of Phosphorus.

For **Paralysis, Melancholia, Lapse of Memory, etc.** A powerful Aphrodisiac. A clear, permanent, palatable solution, containing $\frac{1}{100}$ gr. unaltered Phosphorus in each teaspoonful.

Sold by apothecaries generally.

H. T. PECK & CO., Chemists, Philadelphia.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, very agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION,

CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HÆMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris, notably Drs BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success. Prepared by E. GRILLON, Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris.

To be had of all Respectable Chemists throughout the world.

MEDICATED DISCS

FOR HYPODERMIC INJECTION.

SPECIAL NOTICE.

Messrs. SAVORY & MOORE beg most respectfully to inform the MEDICAL PROFESSION generally that the great demand which has arisen for their **GELATINE PREPARATIONS,** since they were first introduced, has compelled them to extend their Laboratory in New Bond Street, by the erection of a Department for the exclusive purification and manipulation of these articles. The discs for **HYPODERMIC INJECTIONS,** and for **OPHTHALMIC PURPOSES,** as well as the **LAMELS FOR INTERNAL USE,** will henceforth be prepared under the **immediate supervision of the Firm.** This Special Department is so arranged that the delicate process of manufacturing the Sheets of Gelatine cannot possibly be interfered with, and consequently the **perfect purity** and **accurate dosage** of these important and delicate preparations may be **THOROUGHLY RELIED ON.**

The HYPODERMIC DISCS are now sold in boxes, which have been found to be of greater advantage for their preservation than the leather wallets originally employed.

SAVORY & MOORE, 143 NEW BOND STREET, LONDON, ENGLAND.

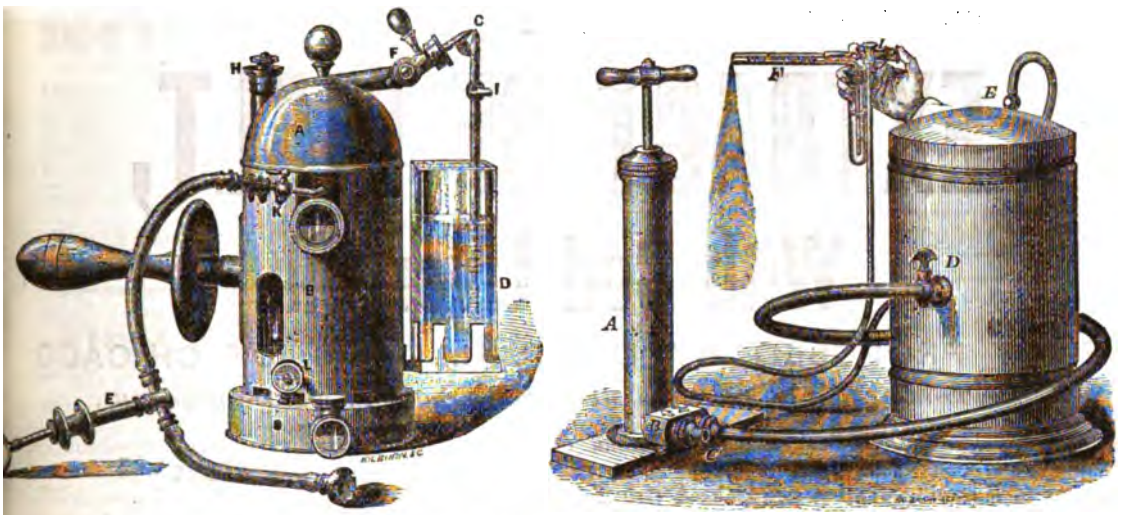
THE ANTISEPTIC ATOMIZER.



In this apparatus we have incorporated some of the best features of the Atomizing Apparatus heretofore made by us, already familiar to the profession. It is of best materials and workmanship—strong, durable, convenient, easily regulated, and by means of a new attachment of our own design, adequate without cessation of spray for any operation, or series of operations, however extended. Full description on application.

A NEW PAMPHLET

On Atomization of Liquids, with Formulæ of many articles of the Materia Medica successfully employed in the practice of a well-known American Practitioner, together with a description of the best forms of apparatus, will be sent post-paid on application. Also our new illustrated Catalogue of Surgical Instruments.

ATOMIZING APPARATUS BY COMPRESSED AIR.

This apparatus will be found entirely satisfactory on account of its elegance and perfect working qualities. It has a double acting Brass Pump (condensing or exhaust, at will), with valves unchangable by time or use. Strong Copper Receiver, Nickel Plated, 12 feet, light and flexible but strong; brown-colored Tubing and a self-closing cut-off (our own design, represented at I), readily connected with any tubes now in use.

PRICES REDUCED.

CODMAN & SHURTLEFF,

MAKERS AND IMPORTERS OF SUPERIOR SURGICAL INSTRUMENTS,

13 & 15 Tremont Street, BOSTON.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt, and all its combinations.

EXTRACT OF MALT,

With Cod Liver Oil,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO

(See Transactions of American Medical Association, for 1876, page 176),

Is presented to the Medical Profession as an efficient, palatable, and very stable combination, consisting of equal parts of the **Extract of Canada Barley Malt** and the best quality of genuine **Norwegian Cod Liver Oil.** Many patients take this preparation who can not take the oil in any other form. It may be employed in all cases where Cod Liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

EXTRACT OF MALT,

With Cod Liver Oil and Phosphorus,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod Liver Oil, Phosphorus being added in the proportion of 1-100 grain to the dose, and so combined, as to be perfectly protected from oxidation. The **Trommer Extract of Malt Company** prepare this combination agreeably to the suggestion of **Dr. Wilson Fox.** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

EXTRACT OF MALT,

With Cod Liver Oil and Iodide Iron

Added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod Liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians referring to it in terms of high praise.

NAPHEYS'

MEDICAL THERAPEUTICS.
1 Vol., Large 8vo. 598 Pages.

SURGICAL THERAPEUTICS.
1 Vol., Large 8vo. 588 Pages.

Fifth Edition (1878), Enlarged and Revised to Date.

These two books, published this year, have received more positive and general testimony from the medical press, and from purchasers, as to their real, practical, business value to the physician, than any other work of the kind extant. Witness the subjoined extracts:—

From the *St. Louis Medical and Surgical Journal*:—"Practitioners will find it a very valuable aid to practice, and after actual use of it, as almost indispensable."

From the *New York Medical Journal*:—"A work of decided interest, and of much value to the surgeon and general practitioner."

From the *Toledo Medical and Surgical Journal*:—"To the vast army of men living and moving in our profession, this great work, considering the Medical and Surgical volumes as one, will be of untold value."

From the *Buffalo Medical and Surgical Journal*:—"They are such volumes as the busy practitioner will prize most highly, as nothing but practical matter, brief, specific, and well approved, is found in them. They constitute a Compend of Practice in Medicine and Surgery, wisely made up from the best and most recent authorities."

From the *Michigan Medical News*, *March*, 1878:—"The Library of those who have neither of these works, will not be complete without both."

The *Louisville Medical News*, January 12, 1878, devotes more than four of its double-column pages to a careful analysis and review of these works. The following extracts give a correct idea of the tone of the article:—"Though a compilation, the plan of the work is entirely original, and marks a new departure in medical literature. We bespeak for it a favorable reception, and are satisfied it will serve a good purpose. It is eminently a practical work.

The *Virginia Medical Monthly*, January, 1878, says:—"These volumes must prove of the utmost practical utility to every physician and surgeon who owns them. With a rare estimate of the useful, the Editor has compiled from home and foreign journals, and from private sources, the best prescriptions of the most eminent authors and clinical observers. We cannot too highly commend these works to the 'busy practitioner;' to those who are anxious to procure in a nutshell, the latest practical information as to the treatment of disease; and also to those *whose means will not permit them to purchase many books at a time.* These are all, and even more than the editor claims for them."

The *Pacific Medical and Surgical Journal*, January, 1878, speaks as follows:—"In these, *and in no other books*, the reader will find a bird's-eye view of medical and surgical practice in America and Europe. The most accomplished and successful physician, *ceteris paribus*, is he who is most familiar with the greatest number of remedies and appliances. And we are certain that nowhere else can be found a print-picture exhibiting these so distinctly, so practically and so numerously."

The *Detroit Lancet*, January, 1878, expresses its opinion in the following words:—"We have carefully examined this work, and find that the author has attained his aim with more than usual success. Rightly used, such a work has a great and positive value to every practitioner. We find here the name and work of every man who has contributed aught to the advancement of the art of medicine. It is surely no mean privilege to the young practitioner to be able to refer to the practical advice of all the celebrated therapeutists of the age."

The *Cincinnati Medical News*, January, 1878, very justly says of the object of the work:—"It does not consist of a mere collection of prescriptions to be prescribed in the treatment of this or that affection, although in it are found hundreds of prescriptions by the most eminent physicians, but it affords the reader *an intelligent idea of the combining of remedies for the fulfilling of such indications as will be apt to be presented in the practice of his art.*"

The *Maryland Medical Journal*, February, 1878, reports as follows:—"We have examined this work carefully, with the special view of determining its value to the profession, and find that it meets all the requirements of the busy practitioner whose time will not admit of extended reference to, and examination of, many authorities. It is arranged in a convenient form for ready reference, and will be found useful on all occasions. * * * The two books are most valuable additions to the medical and surgical literature, and evince great care and research on the part of the author."

After a similar conscientious examination of the volumes, the reviewer of the *New Orleans Medical and Surgical Journal*, January, 1878, writes of the Surgical volume:—"We have studied the book carefully, and are surprised at the amount of information condensed within its pages. We have looked in vain for anything in surgical therapeutics, really proved, which has been omitted. It supplies a want long felt, and surgical literature is not complete without it. A surgeon can familiarize himself at a glance with the treatment adopted by members of the profession whose success and skill merit followers. The work is cordially recommended."

The two books are sold separately, at ***$4.00*** *in cloth, or* ***$5.00*** *in full leather, each, sent by mail, post-paid. Full Tables of Contents sent on application.*

LAZELL, MARSH & GARDINER'S
POWDERED
MEDICINAL EXTRACTS.

The attention of physicians and pharmacists is respectfully called to the following in relation to an improvement in preparing medicinal extracts, so that they may be readily dispensed without loss, change, or inconvenience. This is readily accomplished in the *Powdered Medicinal Extracts* which are of the same medicinal strength as the solid extracts prepared in our own Laboratory; and both of these varieties are superior to similar preparations usually offered for sale.

For convenience, these powdered extracts meet the wants of the dispensing pharmacist, and for their reliability and medicinal action, they have received the unqualified approval of those physicians who have employed them. Our powdered extracts may in all cases be substituted *in equal weight* for the *Solid Medicinal Extracts*.

The following list includes our present productions, but will be increased to meet the demands of pharmacists and physicians:

	per oz.
Powd. Ext. Aconite Leaf	.40
Powd. Ext. Aloes	.40
Powd. Ext. Belladonna	.50

SOLUTION DIALYSED IRON.

A pure neutral solution of Ferric Oxychloride (Fe_2Cl_6 23 Fe_2O_3), which will keep without change.

CITRATE OF IRON AND CINCHONIDIA,

A new Scale Salt of value, and which is asserted to equal in medicinal value, Citrate of Iron and Quinine. It is freely soluble, and adapted for use either in solution or pill.

Nearly every one of the "Officinal" preparations of the U. S. Pharmacopœia, 1873, can be supplied of our own manufacture, besides most of the non-officinal remedies in use.

LAZELL, MARSH & GARDINER,
Laboratory, 7 Gold St. 10 & 12 Gold St., N. Y.

Petroleo Virtus Validissima

Is the *emollient* and *healing principle from petroleum*, highly *purified* and *concentrated* without the use of chemicals. It has no affinity whatever for oxygen or moisture. Undergoes no decomposition, rancidity or fermentation in any case of application in any climate or temperature. It is a perfect protection of diseased or inflamed parts from atmospheric action. It is so bland, soothing and homogeneous as not to irritate the most sensitive conditions, even the eye. It is uniform in its action. Its healing power is wonderful in a very wide range of cases —such as Burns, Scalds, Cuts, Inflammations, Diseases of the Skin and the Lower Bowels, etc., etc. It is pronounced the best Surgical Dressing, and will penetrate the bandages without removal. A perfect protection against rust and coloration of instruments. It has great affinity for Carbolic Acid; Combines with Sulphur, Iodine, Bromine, Camphor, Gums, Resins. For general purposes it is fluid at 85° Fahr. For injections, fluid at 32° Fahr. Put up in 3½ oz. Bottles, 1 lb., 5 lb., and 10 lb. Cans.

Printed Pills and Granules

These new pills and granules are the only real improvement made in pills for many years. While they are a novelty, their principal claim to superiority lies in the fact that they have undoubted advantages over all other pills, and are at once the perfection of accuracy, and a safeguard against mistakes or substitution. Their claim to the confidence of the medical profession and pharmacists rests on the entire purity of the ingredients used; perfect accuracy of composition and uniformity of size; ready solubility; tastelessness and harmlessness of the coating, which is vegetable; perfect preservation in all climates; entire security against mistakes or substitution, every pill or granule having printed upon its surface either its common name or its composition, as Pil. Cath. comp., or Pil. Quin, 1 grain.

We now offer the following assortment:

Granules, containing 1 milligramme, or 1-64th gr.: Arsenious Acid; Arseniate of Soda; Aconitine; Atropine; Digitaline; Bi-chloride of Mercury; Sulph. of Morphia; Phosphorus; Strychnia.

" containing 4 milligrammes, or 1-16th gr.: Sulph. of Morphia.

" containing 8 milligrammes, or 1-8th gr.: Sulph. of Morphia.

" containing 1 centigramme, or 1-6th gr.: Codeine; Calomel; Proto-iodide of Mercury; Podophyllin.

Pills, prepared according to the U. S. Ph. when officinal:

Aloes; Aloes and Assafœtida; Aloes and Mastich; Aloes and Myrrh; Assafœtida; Comp. Cathartic; Comp. Calomel; Comp. Colocynth; Iron, Carbonate; do. Citrate, 2 grains; do. Citrate of, and Quin., 2 grains; do. Pyrophosphate, 2 grains; Blue Pills, 3 grains; Calomel, 5 centigrammes, or 3-4th grain; Podophyllin, 1-6th, 3-4th and 1 grain; Proto-iodide of Mercury, with Opium, Ricord's formula; Quin. Sulph., 3-4th, 1, 1½, 2 and 3 grains; Rhubarb; Comp. Rhubarb; Santonine, 3-4th gr.; Triplex; Valer. Zinc., 3-4th gr.

These pills are sold in bottles of 100 and 500. Other pills will be added, and special formulæ made to order. Descriptive lists, giving assortment and prices, also samples, sent on application.

FOOD for INFANTS and INVALIDS.

BLAIR'S
PREPARED WHEAT FOOD,
A Nutritious Diet for Infants.

Contains more of the nitrate and phosphates (muscles and bone forming element) than most farinaceous foods. Price low and sells well; guaranteed to keep.

HENRY C. BLAIR'S SONS,
Eighth and Walnut Streets,
PHILADELPHIA.

THERE IS NO DOUBT

That thousands of children die from deficient or improper nourishment, and Mothers and Nurses should see to it that the infant constitution is built up and strengthened by proper food before the trying

SUMMER MONTHS

come, which are the most dangerous to infant life. For this emergency

RIDGE'S FOOD INFANTS INVALIDS

has the indorsement of the Matrons and Physicians of the principal Infant Asylums and Lying-in Hospitals in the United States, and Physicians of all schools have given it their unqualified approval as a HIGHLY NUTRITIOUS and easily assimilated food, and *especially adapted for Infants and growing children.*

RIDGE'S FOOD INFANTS INVALIDS

is also specially adapted to adults suffering from weakness of the digestive organs, and, therefore, those afflicted with any symptoms of INDIGESTION will find, on trial, it has all the qualities that have been claimed for it, and all that they can desire in the way of nutrition and strength.

Put up in four sizes, with

WOOLRICH & CO., on every label.

NESTLE'S MILK FOOD,

Or LACTEOUS FARINA.

Contains all the elements of a complete nutrition in the most assimilable state FOR INFANTS FROM THE FIRST WEEK OF THEIR LIFE. It is also an excellent Food for debilitated adults.

CONSTITUENTS COMPARED with WOMAN'S MILK.

1,000 parts of woman's milk contain		1,000 parts of milk food contain:	
Water, - - -	873.80	Water, - - -	49.40
Organic Substances, -	124.40	Organic Substances, -	931.10
Ashes, - - -	1.80	Ashes, - - -	19.50
	1,000.		1,000.
Nitrogen, - -	4.83	Nitrogen, - -	21.40

The ashes of the MILK FOOD are the same as woman's milk, and consist of *(Bases)* Lime, Potash, Soda, Magnesia, Oxide of Iron, Alumina (Traces); *(Acids)*, Phosphoric (2.15 in 1,000 parts), Sulphuric, Hydrochloric, Lactic (traces).

Mixed with nearly four times its weight of water, it forms a fluid containing as much Azote as woman's milk; and with two parts it forms a pap twice as nourishing.

For infants it is generally diluted with 10 or 5 measures of water, as directed on the box.

The MILK FOOD, extolled throughout Europe, is largely used at the Nursery and Child's Hospital of New York, and most of the hospitals of the United States. It is highly recommended by all the physicians whose attention has been called to it.

The following Physicians are referred to by special permission: Isaac E. Taylor, John T. Metcalfe, Joseph J. Hull, Robert F. Weir, J. Lewis Smith, Edward J. Dunster, James B. Reynolds, Wm. H. Maxwell, New York; Theo. R. Varick, Jersey City; Wm. K. Brown, Thos. McAllister, H. J. Garrigues, Brooklyn; William B. Atkinson, F. F. Maury, J. A. Meigs, F. G. Smith, E. A. Spooner, Philadelphia.

Retailed 60c. per Box. Cheaper than cow's milk.

Liberal Discount to the Trade and Charitable Institutions.

CAUTION.—Physicians are particularly warned to beware of numerous counterfeits and imitations of so-called Lacteous Farinas, and to *refuse all boxes not bearing Nestlé's name as well as that of*

H. ASTIE, Sole Agent,
15 South William Street, NEW YORK.

The K. & M.
INFANTS' FOOD

Perfectly free from Starch and perfectly soluble.

CONTAINS NO ALCOHOL.

An extract prepared from malted grain, consisting of grape sugar, dextrine, alkaline phosphates, etc.

"A child deprived of its mother's milk, can only be fed properly when the food is equivalent in power to woman's milk."—BARON LIEBIG.

DIRECTIONS FOR USE.—Dissolve a tablespoonful of this extract in one-third of a pint of fresh, warm cow's milk, by simply stirring it. This being double the strength of mother's milk, it should be diluted with an equal quantity of warm water, until the infant is some months old.

Prepared with the most scrupulous care by

Papoma for Infants & Invalids.

IS ESPECIALLY DESIGNED FOR INFANTS AND INVALIDS.

It possesses all the required elements necessary to nurture, strengthen and promote a vigorous and healthy growth in children, and to restore and sustain the exhausted vitality of the sick and debilitated. It is delicious and palatable when no other diet is relished or desired. Eminent physicians highly approve and regard it as much superior to all other preparations of food. It may truthfully be claimed as a substitute for Nature's own food to infants—a fact which all mothers and those rearing children should remember.

JOHN WYETH & BRO., Philadelphia.

HORLICK'S FOOD FOR INFANTS.

This article, as shown by analysis, is the only true substitute for Mother's Milk, and, unlike the other foods, **does not contain starch.** Infants cannot digest **starchy foods** until they have their teeth. This preparation also contains the **Phosphates** so essential for the production of bone and brain. It will **sustain life single-handed.** Requires no cooking.

We also Manufacture

HORLICK'S FOOD FOR DYSPEPTICS.
HORLICK'S FOOD FOR CONSUMPTIVES.

Price $1.00 per bottle. Trial size, 50 cents.

J. & W. HORLICK & CO., Chicago, Ills.

PREPARED FOOD

FOR

INFANTS AND INVALIDS.

Prepared especially to meet the requirements of the growing Infant, containing the Phosphates and all the health-giving properties of the finest wheat, many of which are altogether rejected in the usual process of preparing flour.

Also admirably adapted on account of its easy digestibility to Invalids. Price 35 cents per package.

TO PHYSICIANS.
THE CELLULOID TRUSS.

"The Celluloid truss is a remedy of great importance, which is offered to the public. We say 'remedy,' because this truss is not only an immense alleviation to those afflicted with hernia, but an absolute cure for the complaint, if applied in time. We have unfortunately had considerable experience in this matter, and we are convinced that the last truss invented is the best. This is the Celluloid truss, and sold only by the sole agent, Mr. A. J. Ditman, the eminent druggist, corner of Broadway and Barclay street.

Celluloid is a very remarkable substance, composed of tissus of cotton and gum camphor, exposed to an enormous pressure. This material is applicable to many uses, such as the manufacture of jewelry, billiard balls, piano keys, etc.; but by far the best use to which it can be put is the making of trusses for the relief of hernia. Trusses made of this material have over others many advantages, which we propose to point out. To do this, it will be necessary to allude to the defects of some of the other kinds, which are entirely remedied in the Celluloid truss.

A truss with a leather pad is subject to the charge of uncleanliness, as the perspiration of the body, especially in summer time, enters the pores of the leather, very shortly imparting to it an offensive and unpleasant odor. The same objection will apply to the elastic trusses of various kinds, as they are all made with cotton or linen fabrics susceptible of imbibing moisture. The hard rubber trusses, though not open to this objection, are subject to another. They will split and crack in cold weather, and they emit an unpleasant odor of rubber.

The Celluloid truss obviates all the above named drawbacks. It is manufactured of a finely tempered steel spring, covered with the celluloid, which is forced on it under immense pressure, without any seam, and quite as smooth as the finest ivory. The material is absolutely impervious to moisture, consequently entirely protecting the spring from rust. The pad is made of the same material and in different forms. Being hollow and perfectly smooth, it is extremely light and comfortable to the person. Another advantage possessed by this truss is that it is adjustable, *i. e.*, the pressure can be regulated to the work to be performed by being increased or decreased at pleasure. No truss hitherto invented will permit of being used in bathing, as the material they have been composed of is injured by the water; but the Celluloid truss, from the nature of the material it is made of, suffers nothing from wet, so that many a sufferer from hernia, who has until now been precluded from the enjoyment and health-giving resules of a bath, because it was too dangerous to lay aside his truss for the purpose of bathing, can now take a hot or cold bath, swim or dive, as may suit him, without fear of injuring his truss, if he wear a "Celluloid."

We should like to describe this truss more in detail, but want of space forbids, and we must be content with simply calling attention to the above, and hereby extend an invitation to all Physicians to call or send for particulars."

The price of the Celluloid truss ranges about as other trusses

The special advantages of the CELLULOID TRUSS are, that its force may be adjusted to any required degree, without impairing the spring, and its being imperishable

N. B.—A practical adjuster in attendance. Private rooms convenient.

CHAMPION SPOUTING SPRING NATURAL WATER

FROM SARATOGA.

For sale by all respectable Druggists and Dealers in Mineral Waters, on Draught and in Bottles.

THE CHAMPION SPOUTING SPRING contains a very large preponderance of the elements which render mineral waters valuable as medicine, and which are in constant use by Physicians of the various schools; and the remarkable cure of some of the prevailing diseases has given the water of this Spring great favor among professional men. For *Headache*, or disordered state of the Stomach arising from the use of wines or hearty eating it is a fine corrective, giving immediate relief. It is invaluable for the treatment of Biliousness, Dyspepsia, Constipation, Piles, Rheumatism, Neuralgia, Cutaneous Diseases, Scrofula, &c., and owing to the presence of Lithia Magnesia and Bi-Carbonate of Lime, is recommended by Physicians for Bright's Disease of the Kidneys, and Diseases of the Bladder.

DIRECTIONS.—As a cathartic, take half a pint or more, as experience may dictate, before breakfast, and at a moderately high temperature. If prompt action is desired. As a tonic, half a glass three or four times a day, between meals. As the Cathartic principles of the CHAMPION WATER are double those of the Congress Spring, only half the quantity is required.

The constant and increasing success of the CHAMPION WATER is due to its hygienic properties; it is *refreshing* and *healthful*, and should be found in every home.

PRICES:

In New York. *Delivered free of Charge.*

Pints, 4 dozen in a case	$9 00
Quarts, 2 dozen in a case	7 00

In Saratoga. *Delivered at the Cars.*

Pints, 4 dozen in a case	$8 00
Quarts, 2 dozen in a case	6 00

Orders addressed to **Champion Spouting Spring, Saratoga, N. Y.**, or to the Company's office, **205-213 E. 12th St., New York**, will receive prompt attention.

What will the Weather be To-morrow?

POOL'S SIGNAL SERVICE BAROMETER,

Or Storm Glass and Thermometer Combined

WILL TELL YOU!

It will detect and indicate correctly any change in the weather 12 to 48 hours in advance. It will tell what kind of a storm is approaching, and from what quarter it comes—invaluable to navigators. Farmers can plan their work according to its predictions. It will save fifty times its cost in a single season. There is an accurate thermometer attached, which alone is worth the price of the combination. We will send it FREE to any address on receipt of **$2.00.** This great WEATHER INDICATOR is endorsed by the most eminent Physicians, Professors, and Scientific men of the day, to be the *BEST IN THE WORLD.*

Boericke & Tafel's

MEDICINAL TRITURATIONS

—AND—

Fresh Plant Essences.

TRITURATIONS.

We have prepared and put on the market since a number of years Triturations of Minerals, Chemicals, Metals and other Medicinal Substances, which are carefully triturated with purified Sugar of Milk, for one full hour at a time, in the proportion generally of one in ten, or one in one hundred; and it is found that by this process the action of the remedies is rendered more prompt and effective, even in minute doses, than when prescribed in the usual form in larger quantities.

Fresh Plant Essences.

Tinctures made in the usual manner, from dried roots and herbs, are variable in their effects—are often found untrustworthy. It is conceded that in drying many plants and roots lose most of their volatile constituents, and some even undergo a decided change. A case in point is Hydrastic Can., the fresh root of which possesses narcotic properties which in the dried are wanting. It is at all times difficult to detect old from freshly-garnered dried plants; hence, often old and shop-worn materials are used, sometimes from sheer carelessness, more often from necessity.

To obviate this difficulty, we procure of all remedies indigenous to this country, the fresh plants or roots when in their full vigor, and carefully prepare therefrom essences or tinctures, which retain their full efficacy unimpaired for years.

Of medicinal plants indigenous to Europe, we import the essence ready prepared. The exact proportion of fresh plant or root to the tincture or essence is given with each bottle, so as to enable the practitioner to accurately determine the quantity administered.

These standard preparations are furnished in original packages, from one ounce to one pound, each bottle having our firm's name blown into the glass, the cork being secured by a metallic capsule, also bearing the firm's name.

Physicians can order either direct or through their Druggists, who can readily procure our goods through the jobbing houses.

Explanatory price currents, with lists of such preparations as we carry in stock, furnished free on application.

Address,

BOERICKE & TAFEL,

Manufacturing Pharmacists,

No. 145 GRAND ST., NEW YORK.

CONCERNING

BELLADONNA PLASTER

A Few Words to Physicians and Surgeons.

BY A PHYSICIAN.

Until quite recently Manufacturing Chemists, in offering new combinations and improvements in Pharmacy to the Medical Profession, have found the Faculty very hospitable to the introduction of improvements adapted to their use.

But within a short time, conscientious Physicians have begun to discuss among themselves, very seriously, the propriety of welcoming the newer products of Pharmacy.

Why is this?

Because it is found that certain manufacturers, appealing to the convenience and profit of the apothecary, have been sacrificing merit and therapeutic value to elegance of appearance, and have employed officinal forms and professional nomenclature to foist upon the physician, by aid of the druggist, compounds of little or no value, and altogether unworthy of the high claims made for them.

Thus, the manufacture of medicinal agents for the use of Physicians is rapidly degenerating into empiricism, and is becoming almost as objectionable as the ordinary clap-trap of the "patent medicine" business.

Notably is this true with reference to that important and useful agent, *Belladonna Plaster*.

Dr. J. M. Grosvenor, graduate of Dartmouth, was the first to appreciate and turn to practical account, an improvement in compounding Belladonna Plaster by using purified rubber as a basis of combination.

His experiments in affecting the combination in therapeutic and mechanical perfection were long continued, exhaustive and expensive.

But he finally succeeded perfectly, and his improved Belladonna Plaster was everywhere welcomed by the Faculty, as being the best form of this agent yet presented. It was universally adopted as the standard Belladonna Plaster.

Why?

Because it proved to be an entirely reliable preparation — presenting the drug uniformly, accurately, and with the most precise and skilful attention to convenience and activity.

The widespread popularity of Dr. Grosvenor's Improved Belladonna Plaster at once attracted the cupidity of empiricism, and the drug market was soon flooded with so-called "Belladonna" Plasters, branded "U.S.P.," and offered to Druggists upon one recommendation, *namely:* "It is 50 per cent. cheaper than Grosvenor's!"

A good many gudgeon-like dealers promptly took the bait, and before long physicians began to express surprise and chagrin because Belladonna Plaster did not respond to their expectations in its effects as formerly.

Dr. Grosvenor found himself in receipt of numberless indignant communications upon the subject.

Belladonna Plaster is sold to the druggist in yard rolls, enclosed in a tin case. He cuts it into strips for dispensing as the physician may order.

The mechanical appearance and characteristic odor of Dr. Grosvenor's Improved Belladonna Plaster were closely simulated in the empirical articles; and if the druggist saw fit, for his own profit, to deceive the physician, the latter had no means of detecting the imposition except by noting the effect, and thus it happened that for a long time Dr. Grosvenor's legitimate and always reliable product had to bear the odium belonging justly to the empirics who had assailed him by simulating his article.

Finally he adopted, for the protection of the profession, the expedient of stamping his name at short intervals across the back of his "Belladonna Plaster" in violet ink, but omitting the words "Belladonna Plaster," for reasons which practitioners will understand.

Thus the fraud was checked, wherever the Faculty were informed of the precautionary measure; and the object of this article is to ask physicians everywhere to observe this test of genuineness, and in prescribing, to write for "*Emp. Belladonna Grosvenori.*

The true Belladonna Plaster in rubber combination will always bear this guarantee of genuineness—J. M. Grosvenor, M.D., (accompanied by a "trade-mark," consisting of a Belladonna Leaf, with the letters B and P upon it in monogram), printed in *fac simile*, at intervals of three inches across the back of the plaster in violet ink.

The profession are reminded that a true Belladonna Plaster, accurately prepared, *cannot* be a *cheap* product. Dr. Grosvenor originally sold his Plaster at the lowest practicable price, and that price has never been changed. Any plaster professing to contain the same elements that is sold at any price considerably lower, stamps itself at once as being the work of quackery.

Dr. Grosvenor has prepared a brief treatise upon Belladonna Plaster, which will be mailed (with sample of plaster) to any physician desiring it.

Physicians, if unable to obtain Dr. Grosvenor's improved Belladonna Plaster at their drug stores, will be supplied direct from the laboratory, by mail, upon receipt of one dollar. This concession is made to physicians only, and to those who cannot obtain the veritable article at home.

Address,

J. M. GROSVENOR, M.D., *22 Park Place,* **NEW YORK.** or **GROSVENOR & RICHARDS,** *97 Oliver Street,* **BOSTON.**

FOOD IS THE BEST TONIC!!

TRADE MARK.

MENSMAN'S

PEPTONIZED

BEEF TONIC.

The great necessity for a fluid food that would possess all the elements necessary for the support of the system, having been long felt by the medical profession, we call their attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drug or chemicals.

It is prepared after a thoroughly tested and scientific method.

PROPRIETORS,

CASWELL, HAZARD & CO.,

DRUGGISTS AND CHEMISTS,

Fifth Ave., cor. 24th St.; & Sixth Ave., cor. 39th St., New York.

McKESSON & ROBBINS'
GELATINE-COATED PILLS.

COCA EXTRACT, 1 gr.

Made from freshly imported leaves. As the leaves become almost inert with age, a preparation of this nature is necessary to enable the Physician to judge correctly of the value of this remedy. Coca Erythroxylon is a South American plant, used by the natives as a substitute for tea, coffee, tobacco, hashish and opium of other countries. It imparts vigor to the muscles as well as to the intellect, and enables the partaker to endure great fatigue with ease. The feeling of exhilaration accompanying its use, is said not to be followed by any depressing effects.

ERGOTIN, 8 grs.

Each pill is equal to half a teaspoonful of officinal fluid extract. The value of Ergotin, in the place of the crude drug and the Fluid Preparations, is conceded; and it is being largely administered both in this country and in Europe.

GRINDELIA ROBUSTA EXTRACT, 3 grs.

The Solid Extract is ten times the strength of the Herb; it can be used much more readily and with better effect than any of the liquid preparations. The use of this remedy in Hay Fever, and all Asthmatic difficulties, has increased largely in the Eastern States and Europe, and its therapeutic value is conceded. (Dose, 1 to 3.)

GUARANA EXTRACT (PAULLINIA), 3 grs.

The Solid Extract is eight times the average strength of the drug. The value of Guarana, in many phases of sick, nervous and sun Headache, as well as in Neuralgia, and in irritations of the mucous membrane, has become well-known to practitioners, and its happy effects, in Diarrhœa, Dysentery and kindred diseases, have been attested in numerous cases. (Dose, 2 to 3.)

JABORANDI EXTRACT, 3 gr.

These pills present a much better and more acceptable form of administering this powerful Diaphoretic and Sialagogue, than any of the liquid preparations. Valuable in Rheumatism and Syphilitic troubles of long standing. (Dose, 1 to 3.)

CALCIUM SULPHIDE, 1-10 gr.

Strongly recommended "in cases of Scrofulus and other unhealthy sores, glandular enlargement, boils occurring in crops, &c." In many skin diseases it is strongly indicated, being not only anti-parasitic and anti-herpetic, but also stimulant and tonic.

SALICYLIC ACID WITH MORPHINE.

{ Acid. Salicylicum, 2 1-2 grs. }
{ Morphiæ Sulphas, 1-12 gr. }

SALICYLIC ACID WITH MORPHINE.

[Acid. Salicylicum, 5 grs. Morphiæ Sulphas, 1-8 gr.]
Strongly recommended in Rheumatism, both acute and chronic.

SANDAL WOOD EXTRACT, 1 and 2 grs.

These pills contain both the oil and resin existing in Sandal Wood, are believed to be superior to the oil alone, and are more convenient of administration.

IRON, DIALYZED, 2 grs.

Made from Merck's scales or plates of Dialyzed Iron, and about twenty times the strength of the solutions in market.

I have in stock every Gelatine-Coated Pill made by McK. & R.

T. H. SAYRE, Dispensing Chemist,

Sixth Avenue, cor. 46th Street, New York.

FOR SALE BY DEALERS, GROCERS AND DRUGGISTS.

Pullna Bitterwater.

The only Bitterwater that received the Prize at the International Exhibition in Philadelphia in 1876.

This is the most effective and least weakening of any of the Alkaline Springs known. It is used with remarkable success in gastric difficulties, torpidity of the liver, and habitual constipation. It also has a specific curative effect in malarious fevers of any kind, as it increases the activity of Quinine Sulphate, and considerably shortens the time of reconvalescence. According to the most minute analysis by Barruel, the Pullna Water contains in one litre of water, the enormous quantity of sixty-two grammes of Salts in a crystallized state, of which twenty-one are Sulphate of Soda, and thirty-four Sulphate of Magnesia. This quantity is more than sufficient to explain the purgative qualities of the water. The other Salts, especially the Lithium and the Bromide of Potassium, increase in a high degree its medical effects in giving to it the peculiar qualities by which a natural Mineral Water is distinguished from an artificial solution of Salts. There is no Mineral Water better qualified to be sent to all parts of the world—a chief reason for its recommendation.

It can be used at every season of the year, and taken either warm or cold. No open-air exercise is necessary.

The dose is from 1—2 wine-glasses for adults; 1—2 tablespoonfuls with milk for children, to be taken before going to bed. An open bottle can be kept for days without change, as the water contains no gas.

Children are equally benefited by it, and it is prescribed for them in doses of a tablespoonful in milk at night, either cold or warm.

WARBURG'S TINCTURE.

Made from the original recipe of Dr. Warburg and used as a specific in malarious fevers and all diseases arising from malaria. This preparation is recommended by the English Government, and extensively used in all the English military hospitals, particularly in the East Indies. (see London *Lancet*, Nov. 18, 1876.)

Please specify, in ordering from any wholesale house, **Warburg's Tincture**, made by **F. A. REICHARDT.**

Price per bottle, 1 oz., **75c.**; per doz., **$5.00.** Per pint, **$5.00**; per doz., **$50.00.**

CRAYON'S D'IODOFORM,

Of Dr. Leblond (Annales de Gynæcologie) for Superficial Ulceration of the Neck of the Uterus extending to Uterine Cavity. **$1.00** per dozen, sent by mail. Orders executed by return of mail.

F. A. REICHARDT, 404 Fourth Avenue, New York.

REICHARDT'S NITRITE OF AMYL PEARLS.

Specific for Sea Sickness, in 5 drop Pearls.

Let the patient lie down for a few minutes, crush a 5 drop capsules and inhale it, and the symptoms will disappear in a few minutes.

These Pearls supply a long felt want in the administration of this powerful remedial agent. A finely blown glass bulb is filled with a given quantity of the Amyl, each 2, 3, 5 and 8 drops, the glass is then drawn out and hermetically sealed. The patient who shall inhale it carries the Pearls in a little box, and at the approach of premonitory symptoms crushes one in a handkerchief and inhales the medicine: the glass is so very thin that the patient runs no danger whatever of wounding himself. The great advantage of this new contrivance is in the rapidity with which a correct dose of the Nitrite of Amyl can be administered by the patient himself, and in all cases of Asthma, Angina Pectoris, Epilepsy, or other diseases where this is essential, these glass Pearls form as yet the best known method of applying it.

Price, 2 and 3 drops, 75c. per doz.; 5 and 8 drops, $1.00 per doz.

Reichardt's Adjustable Brush Holding Rubber Stopple.

This is a tapering rubber stopple, closing the mouth of the vial tighter than ordinary corks, much more durable, impervious to Acid, Iodine, etc., and on account of its length and taper fitting equally well in bottles varying in size from ½ to 6 ounces.

The lower or inner part of the stopple is provided with a tapering hole formed in it to receive the handle or quill of the brush so that whether the stopple is inserted in a bottle or removed from it the brush will be securely held by the stopple.

Put up 1 Dozen Assorted Sizes in a Box. For Sale Wholesale and Retail. **90c.** per dozen; **$10.00** per gross.

F. A. REICHARDT. Pharmacist,

404 Fourth Avenue, corner 28th Street, New York.

VACCINE VIRUS.

EASTERN DISPENSARY——VACCINE DEPARTMENT.

PURE BOVINE (ANIMAL) VIRUS.

This Virus is the result of a continued reproduction from the famed Beaugency stock, propagated under our own immediate supervision at Pearl River, N. Y. It is furnished at the following reasonable

SCALE OF PRICES:

One Quill Slip,	**$ .25**	**Fluid in Capillary Tube,**	**$1.00**
Seven Slips,	**1.00**	**Three Tubes,**	**2.00**

N.B.—Each tube will vaccinate from five to ten persons.

Concrete Vesicle—i. e., Crust or Scab, $1.00 to $3.00, according to size.

HUMANIZED VACCINE VIRUS constantly on hand, as heretofore, at same rates as above.

We guarantee success with 95 per cent. of Quill Slips, and, if used with due care and within one week of reception, will duplicate all failures.

AUGUSTUS W. WEISMANN, *Chair. Vac. Com.*

Address, **S. S. BOCERT, M.D., Eastern Dispensary,**

57 Essex Street, Station B New York City.

A New Form of Non-Humanized Vaccine Virus.

PATENT SOLID LYMPH CONES.

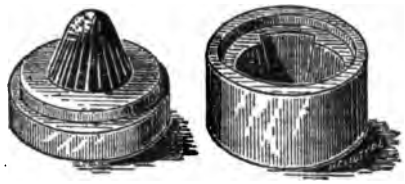

Fig. 2. Fig. 1.

We wish to call the attention of the profession to this new form of animal virus. Having been among the earliest purveyors in this country, we have, during the last six years, conducted a continued series of experiments, hoping to be able to furnish physicians with an article more convenient, economical and durable than quill slips, ivory points, or crusts. Now, after a long trial of solid lymph in our own practice and that of friends in the profession, we have been induced to offer it to physicians as the ultimatum of durability, economy, convenience and reliability. Each cone can be made to vaccinate one hundred or more persons, will remain ert three months or more, and will bear the temperature of all climates. We are satisfied that physicians once using it will use no other form of vaccine virus.

We have constructed an air-tight receptacle for storing and transporting this cone, which is to be used in the following manner: File off a portion of the cone into the cup-shaped depression (shown in Fig. 1), which, previously, partly fill with water. This powder in solution is equal in power to fluid lymph. Into this, uncharged ivory points are to be dipped. and when dried, are ready for use.

We also make a specialty of furnishing reliable, heavily-charged ivory points.

TERMS.

One Solid Lymph Cone and Vaccinating Outfit, consisting of Ten Uncharged Ivory Points, File and Receptacle,	$3.00
Ten Heavily-Charged Ivory Points,	1.00
Single Points,	.20

All virus warranted.

Remit by P. O. Money Order, Registered Letter, or Draft. Send for Circular. Address

New England Vaccine Co., Chelsea, Mass.

ANIMAL VACCINE VIRUS

OF THE

NEW YORK DISPENSARY,

Cor. Centre & White Sts., New York.

The New York Dispensary will continue to supply the ***Medical Profession, Health Boards*** of Cities, and all ***Public*** Institutions of the country, either by direct order or through the best dispensing Druggists of this and other cities, with

FRESH ANIMAL VACCINE VIRUS.

The reliable character of the Vaccine Virus furnished by the ***New York Dispensary*** is fully established in the test of the last seven years.

Having discontinued our engagement with Dr. F. P. Foster, and accepted his resignation, the Trustees have elected Dr. Nathaniel A. Robbins, as Vaccine Director, whose whole time will be given to the interests of this ***Department***. Dr. E. A. Lewis will be associated with Dr. Robbins, each having had a long and successful experience in the production of ***Animal Vaccine Virus.***

A recent trip to Europe has given us much valuable information of the most accepted methods of producing Virus. We are prepared to introduce a new stock of Lymph, known as the "Vanves," at present in the highest favor in Germany, Belgium, and France.

Quill Slips (¼ quill charged at square cut end convex surface),	***25c.***
Capillary Tubes,	***$1.00***
Crusts—In powder,	***2.00***
Ivory Points (to order), in packages of 5 to 10,	***75c.*** to ***1.50***

We would recommend Quill Slips as preferable, and in all cases of primary vaccination will fully guarantee.

Fresh supplies of Vaccine, every three days, can be obtained of New York Dispensary, Centre and White Sts.; at Laboratory, 94 Pineapple St, Brooklyn; Caswell & Massey's, Broadway and 25th St.; New York Hospital, West 15th St., and of all the leading Druggists in the City.

Liberal terms made with Druggists, Health Boards, and Public Institutions.

NEW YORK DISPENSARY, Cor. Centre & White Sts., N. Y.

Drs. ROBBINS & LEWIS, 94 Pineapple St., Brooklyn.

BOVINE VIRUS (RHODES').

This Animal Vaccine Virus, now used exclusively in the North Eastern Dispensary, is obtained in its purest form, under the immediate direction of Dr. Warren Schoonover, and is endorsed by many of our leading Physicians, such as Willard Parker, M.D., Professor of Clinical Surgery College of Physicians and Surgeons, New York City, and many others, and is offered to the profession the following rates:

One Quill Slip (charged in convex surface at square cut end),	***20 cents***
Seven " " " " "	***$1.00.***
Crusts, (Humanized, first removal from heifer,) each,	***2.00.***

Each Quill is completely excluded from the action of the atmospheric air by a closely-fitting hermetically-sealed gutta percha covering, impervious to water or other destroying influence, and is guaranteed in all cases of primary vaccinations—if used in accordance with printed directions accompanying the same within eight days of their receipt. Should any fail, a second supply will be furnished gratis. All orders and letters of inquiry may be addressed to

W. SCHOONOVER, M.D., House Physician North Eastern Dispensary, 222 East 59th St., N. Y.

All orders by mail or telegraph, requiring dispatch, will be forwarded without delay, postage free. Remittance should accompany the order. A liberal discount, when used in large quantities, to Public Institutions, Health Boards, etc.

SEABURY & JOHNSON,

Originators and Manufacturers of

U. S. PHARMACOPŒIA MEDICINAL AND SURGICAL

Plasters POROUS AND SPREAD in Rubber Combination

NEW YORK AND LONDON.

Received highest and only Award (Medal and Special Diploma of Merit) over all Foreign and Home Competitors in 1876.

THE JURORS' AWARD IS SUBSTANTIALLY.

ORIGINALITY.—**The successful application of Rubber as a base for all medicinal and mechanical plasters.**

RELIABILITY and general excellence of manufactures.

FACTS CONCERNING MEDICINAL PLASTERS IN RUBBER COMBINATION.

Indiarubber-spread and Porous Plasters possess indisputable advantages over all other Plasters: (1) The Rubber Combination preserves the incorporated drug or extract from decomposition or volatilisation; (2) They adhere closer and firmer; (3) They do not soil the skin or linen; (4) They are always pliable, and never become hard or brittle; (5) They adhere without heat or moisture; (6) An increased effect is obtained by being porous, as the Plaster neither slides nor moves from its affixed position.

BELLADONNA PLASTER, U. S. P.

IN RUBBER COMBINATION.

Messrs. SEABURY & JOHNSON claim that theirs is the most thoroughly reliable and only strictly officinal Belladonna Plaster ever offered the medical profession. It is an improvement on other Belladonna Plasters in several important particulars. First, it is incorporated with the officinal alcoholic extract only. Secondly, it is freed from all stimulating qualities, thereby insuring the uninfluenced sedative action of Belladonna. Thirdly, it adheres with greater tenacity than others. Physicians have been prejudiced in favor of Allen's English Extract; but recent analysis, fairly conducted by competent chemists, emphatically condemns the Inspissated Extract as a mild and unstable product, representing but one-half or less than one-half of the strength of the U. S. P. Alcoholic Extract of Belladonna. The following result, published in the *American Journal of Pharmacy*, in April, 1876, page 145 is furnished for your consideration, which indicates the following percentage of Atropia in the respective extracts:

Alcoholic Extract Belladonna, U. S. P.	***2,571***
Allen's English Extract	***1,411***
Herring's English Extract	***1,179***

The practitioner, as well as ourselves, has but one choice.

Considering these features from a professional standpoint, we offer a Belladona Plaster which cannot be improved upon.

SALICYLATED SURGEONS' RUBBER ADHESIVE PLASTER.

This article has met with unprecedented success, and has been emphatically pronounced by our most skilful General and Orthopœdic Surgeons, as "the best Surgeons' Adhesive Plaster known". It is applied without heat or moisture, conforms quickly to the parts; is perfectly flexible and waterproof, and is ready for use at any moment. It is free from irritating properties and very healing. In counter-extension it has no equal, as it does not move or slide after being applied. Our India Rubber Adhesive Plaster is also spread on twilled linen, which resists the most powerful strain. In addition to these general improvements, the plaster being impervious to water, wounds can be cleansed without removing the plaster, obviating the necessity of constant redressing, saving labor and time. **Whenever continued powerful adhesion is required, it should be procured in porous form.**

MUSTARD PLASTER (spread on Cotton Cloth).

Our Mustard Plaster is a decided improvement over the best French makes; the mustard is manipulated so as to exclude all the moisture, retaining unimpaired by such treatment its essential properties. They are always reliable, conform quickly to the part, and when thoroughly wet do not break into pieces, as is the case with all other mustard plasters. They do not crack or peel off, and can be removed without soiling the skin or linen. Being **manufactured only of pure mustard,** they are perfectly free from Croton Oil or other dangerous substitutes, often employed to induce intense irritation.

RUBBER BLISTER PLASTER (Camphorated) B. P. STRENGTH.

This article has a splendid reputation; its characteristic action is not impaired by age in any climate. The whole fly is incorporated, which by constant manipulation is thoroughly and beautifully combined with the plaster. **Its properties are developed quicker, and its blisters in less time than the crude.** It never fails to blister when used as directed. In addition to its superior efficacy as a vesicant, we incorporate a sufficient quantity of Camphor, which, with the Olive Oil, used on the face with the plaster, **prevents Strangury.** This improvement will be appreciated by every practitioner. It is more reliable than any known epispastic preparation.

CAPSICUM PLASTER.

Recently this article has crept into favor with our most advanced physicians, and judging from results it is doubtless the best counter-irritant known. It has the specific action of mustard without its objections. The characteristic action of Capsicum is uniformly maintained from twenty-four to forty-eight hours, without blistering, being mild, continuous, and stimulating. This plaster is spread in rubber combination and in porous form. Experience has taught practitioners that the Oleo Resin of Capsicum is too violent, frequently vesicating; we incorporate the crude drug in sufficient quantity, without risk to the patient. Our Capsicum Plasters will be found more practical for general use than the **so-called Mustard or Capsicum Papers.**

SPECIAL NOTICE TO PHYSICIANS.

Quality is of great importance to the practitioner: by reliable preparations he supplements his own skill. You can therefore rest assured that every article we manufacture is of strict pharmacopœia strength, and incorporated with perfectly reliable Extracts and Drugs, well selected, carefully and conscientiously prepared, and manufactured invariably under the personal superintendence of one of our firm. **Our whole attention and study is devoted entirely to the art of Plaster making,** and we are ready at all times to receive suggestions from the fraternity, which may be of benefit to all.

Warranted that the register of this thermometer will not unite with the mercury in the bulb A

F. G. Otto & Sons' Patent Truss Pad.

The advantages this Thermometer possesses over *all others*, consist in the reservoir B, in which the registering part of the mercury is collected, forming a body of oblong shape. The surface of this body being large in in comparison to the contracted bore, makes it impossible to unite the register with the mercury in the bulb A.

These Thermometers are well seasoned before graduating, and, consequently, are as correct as they can be made.

THE PATENT SPIRAL SPRING RING PESSARY.

The engraving below shows the manner of manufacturing the Ring Pessary. In a spiral spring of brass spring wire about eight coils of thin rounded whalebone are inserted, which is bound loosely by the spiral spring, thus allowing the coils of whalebone to revolve around themselves, giving, as will readily be seen, more elasticity than they would were they bound tightly by a soft wire of any material, the ends of the spring are then screwed together, and the whole covered with soft rubber of exceedingly smooth surface. We manufacture in the above manner the Bow Pessary, Albert Smith's and all other shapes. *Manufactured only by*

BOSTON, MASS.

NINETY-FIFTH ANNUAL ANNOUNCEMENT. (1878–79.)

Instruction is given by Lectures, Recitations, Clinical Teaching, and Practical Exercises throughout the Academic year. The year begins Sept. 26th, 1878, and ends the last Wednesday in June, 1879. Persons who hold no degree in arts or science must pass an *examination for admission* to this School in Latin, in the elements of Physics, and in English. French or German will be accepted instead of Latin. The admission examination will be held in June both at Boston and at Cincinnati, in September at Boston only. Examination for advanced standing Sept. 23d.

A Catalogue, containing detailed information and specimens of examination papers, will be sent on addressing

DR. R. H. FITZ, Secretary, 108 Boylston St., Boston, Mass.

MEDICAL INSTITUTION OF
YALE COLLEGE.

Spring Term begins February 14, and closes June 25, 1878.

Winter Term begins October 3, 1878; closes January 30, 1879.

FEES.—Matriculation Fee, $5.00. For the Spring Term, $60.00. Contingent Expenses of Laboratory, Spring Term, $10.00. Winter Term, Lecture Fees, $105. Demonstrator's Ticket, paid once a year by those who dissect, $5.00. Graduation Fee, $25.00.

For further information, address

CHAS. A. LINDSLEY, M.D., Dean, New Haven, Conn.

CHICAGO MEDICAL COLLEGE.
(Medical Department of the Northwestern University.)

The Winter Session will commence on the first Monday in October, and close on the third Tuesday in March. The Summer Session begins on the first Monday in April, and closes on the last Thursday in June. This session is *free* to all who have taken the Matriculation Ticket.

FEES.—Lecture Fees for the Winter Term, $50.00. Graduation Fee, $30.00. Matriculation Fee, $5.00. Dissecting Ticket, $5.00. Hospital Ticket, $6.00.

All Fees are payable in advance to the Registrar, Prof. NELSON.

Any further information that may be desired can be promptly obtained by addressing

H. A. JOHNSON, M.D., Secretary of the Faculty,
No. 4 Sixteenth Street, Chicago, Ill.

COLLEGE OF MEDICINE
(Medical Dept. Syracuse University),
SYRACUSE, N. Y.

The distinctive features of this school are a proper gradation in medical studies; laboratory work for students of the first year; frequent clinical exercises for advanced students; a college year of sufficient length to admit of *thorough* preparation in all the branches taught, and frequent recitations and examinations.

The Year embraces two terms of equal length, commencing on the first Thursday in October, and ending on the last Wednesday in June. There is a vacation of two weeks between the terms.

For further information, address the Registrar,

WM. T. PLANT, M.D., Syracuse, N. Y.

WOMAN'S HOSPITAL MEDICAL COLLEGE,
OF CHICAGO.

THE EIGHTH ANNUAL COURSE OF LECTURES

Will commence on Tuesday, October 2, 1877, and continue twenty-one weeks. This institution offers to Women desiring a thorough medical education, first-class facilities for its accomplishment. Dissecting material abundant. The new College *within one* block of the Cook Co. Hospital and Central Free Dispensary, furnishes students the best clinical advantages of any Woman's College in the country.

WM. H. BYFORD, A.M., M.D., President.
T. D. FITCH, M.D., 296 West Monroe St., Secretary.
CHAS. W. EARLE, M.D., 37 Park Ave., Treasurer.

Official Announcements of the Medical Colleges of the U. S.

The Fourteenth Annual Course of Lectures in the

Medical Department of the University of Wooster,

LOCATED AT CLEVELAND, OHIO,

Will begin Wednesday, October 2d, 1877, and continue until the last Wednesday in February, 1878. Medical and Surgical Clinics, Monday and Tuesday, Thursday and Friday of each Week, at Charity Hospital. The Preliminary Term commences Sept. 19. The Summer Course of Recitations and Clinics begins April 2, 1877, and continues 12 weeks.

FACULTY:—G. C. H. WEBER, M.D., Dean; L. FIRESTONE, M.D., LL.D.; W. J. SCOTT, M.D.; H. J. HERRICK, M.D.; CONWAY NOBLE, Esq.; A. C. MILLER, M.D.; JOEL PONNERENE, M.D.; D. B. SMITH, M.D.; H. W. KITCHEN, M.D.; T. CLARK MILLER, M.D.; JOHN H. LOWMAN, M.D.; G. T. GENTSCH, P.C. For Circular and Catalogue, address

H. W. KITCHEN, Sec'y,
No. 3 Euclid Avenue, Cleveland, O.

CLEVELAND MEDICAL COLLEGE,

Cor. St. Clair and Erie Sts. Founded 1843.

FACULTY:—J. L. CASSELS, M.D., LL.D.; PROCTOR THAYER, M.D.; H. K. CUSHING, M.D.; JOHN BENNITT, M.D., Dean; JACOB LAIDY, M.D.; JOHN A. DARBY, M.D.; E. W. MORLEY, M.D.; ISAAC N. HIMES, M.D.; X. C. SCOTT, M.D.; B. W. HOLLIDAY, M.D.; LEWIS BUFFETT, M.D.; H. H. POWELL, M.D.; JNO. F. THOM, M.D.; W. W. HOLLIDAY, M.D.

FEES.—Lecture Tickets, including Matriculation Ticket, $50.00.

WINTER SESSION.—Commences on the third Wednesday in September, and continues 24 weeks.

SUMMER SESSION.—Commences on the first Monday in April.

H. H. POWELL, M.D., Secretary, 323 Euclid Avenue.

Medical School of Maine,

AT BOWDOIN COLLEGE.

Fifty-Eighth Annual Course of Lectures for 1878 will commence February 14, and continue sixteen weeks.

FEES.—Matriculation (payable each term), $5.00. Full Course (in advance), $75.00.

ALFRED MITCHELL, M.D., Secretary,
BRUNSWICK, Me.

Woman's Medical College of Pennsylvania.

THE TWENTY-EIGHTH WINTER SESSION

Will open on Thursday, October 4, 1877, in the commodious new College Building. Clinical instruction is given in the WOMAN'S HOSPITAL, Pennsylvania, *Wills, Philadelphia* and *Orthopædic Hospitals. Spring Course* of Lectures, Practical Demonstrations, and *Winter Quizzes* are free (except for expense of material) to all Matriculants of the year.

Address

RACHEL L. BODLEY, A.M., *Dean*,
North College Ave. and 21st Street, Philadelphia, Pa.

WANTED.

Those of our Subscribers who have received duplicate copies of No. 323 and 361 of THE MEDICAL RECORD will greatly oblige the Publishers if they return them by mail to

WM. WOOD & CO., 27 Great Jones St., New York.

LONG ISLAND COLLEGE HOSPITAL, BROOKLYN, N. Y.

Annual Announcement and Circular, 1877-78.

The READING AND RECITATION TERM will commence October 4, 1877, and close February 14, 1878.
The REGULAR TERM will open March 5, 1878, and close the last week in June following.

FACULTY OF THE COLLEGE.

SAMUEL G. ARMOR, M.D., LL.D., Professor of the Practice of Medicine, and Dean.
GEORGE W. PLYMPTON, A.M., Professor of Chemistry.
JOSEPH H. RAYMOND, M.D., Professor of Physiology.
DANIEL AYRES, M.D., LL.D., Emeritus Professor of Surgery.
ALEXANDER J. C. SKENE, M.D., Professor Diseases of Women and Children.
EDWARD SEAMAN BUNKER, M.D., Professor of Obstetrics.
CORYDON L. FORD, M.D., Professor of Anatomy.
JARVIS S. WIGHT, M.D., Professor of Surgery, and Registrar.
JOHN D. RUSHMORE, M.D., Professor of Materia Medica.

THE CLINICAL ADVANTAGES OF THE LONG ISLAND COLLEGE HOSPITAL ARE UNSURPASSED IN THIS COUNTRY.
For circulars, address DEAN or REGISTRAR.

NOW IS THE TIME TO SUBSCRIBE FOR THE

Cincinnati Lancet & Observer

THE LEADING WESTERN MEDICAL JOURNAL.

It has an able corps of Contributors, gives a condensed statement of the Progress of Medical Science, reviews the latest Medical Works, publishes Society Proceedings, and keeps its readers informed of the Medical News of the day.

The *LANCET AND OBSERVER* is enlarged to 104 pages of reading matter every month. It is handsomely printed on fine, tinted paper, neither labor or expense being spared to adapt it to the wants of the American Practitioner of Medicine and Surgery.

SESSIONS OF 1878-'79.

THE COLLEGIATE YEAR in this Institution embraces a Preliminary Autumnal Term, the Regular Winter Session, and a Spring Session.

THE PRELIMINARY AUTUMNAL TERM for 1878-1879 will open on Wednesday, September 18, 1878, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects, and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students expecting to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. *During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.*

THE REGULAR SESSION will begin on Wednesday, October 2, 1878, and end about the 1st of March, 1879.

FACULTY:

ISAAC E. TAYLOR, M.D., Emeritus Professor of Obstetrics and Diseases of Women, and President of the Faculty.
JAMES R. WOOD, M.D., LL.D., Emeritus Professor of Surgery.
FORDYCE BARKER, M.D., Professor of Clinical Midwifery and Diseases of Women.

AUSTIN FLINT, M.D., Professor of the Principles and Practice of Medicine, and Clinical Medicine.
W. H. VAN BUREN, M.D., Prof. of Principles and Practice of Surgery, Diseases of Genito-Urinary System and Clinical Surgery.
LEWIS A. SAYRE, M.D., Professor of Orthopedic Surgery and Clinical Surgery.
ALEXANDER B. MOTT, M.D., Professor of clinical and Operative Surgery.
WILLIAM T. LUSK, M.D., Professor of Obstetrics and Diseases of Women and Children, and Clinical Midwifery.
WILLIAM M. POLK, M.D., Professor of Materia Medica and Therapeutics, and Clinical Medicine.
AUSTIN FLINT, Jr., M.D., Professor of Physiology and Physiological Anatomy, and Secretary of the Faculty.
JOSEPH D. BRYANT, M.D., Professor of General, Descriptive and Surgical Anatomy.
R. OGDEN DOREMUS, M.D., LL.D., Professor of Chemistry and Toxicology.
EDWARD G. JANEWAY, M.D., Professor of Pathological Anatomy and Histology, Diseases of the Nervous System and Clinical Medicine.

PROFESSORS OF SPECIAL DEPARTMENTS, ETC.

HENRY D. NOYES, M.D., Professor of Ophthalmology and Otology.
JOHN P. GRAY, M.D., LL.D., Professor of Psychological Medicine and Medical Jurisprudence.
ERSKINE MASON, M.D., Clinical Professor of Surgery.
EDWIN L. KEYES, M.D., Professor of Dermatology, and Adjunct to the Chair of Principles of Surgery.
J. LEWIS SMITH, M.D., Clinical Professor of Diseases of Children.
LEROY MILTON YALE, M.D., Lecturer Adjunct upon Orthopedic Surgery.

A distinctive feature of the method of instruction in this College is the union of clinical and didactic teaching. All the lectures are given within the Hospital grounds. During the Regular Winter Session, in addition to four didactic lectures on every week-day, except Saturday, two or three hours are daily allotted to clinical instruction.

The Spring Session consists chiefly of Recitations from Text-books. This term continues from the first of March to the first of June. During this Session daily recitations in all the Departments are held by a corps of examiners appointed by the regular Faculty. Regular clinics are also given in the Hospital and College Building.

FEES FOR THE REGULAR SESSION.

Fees for tickets to all the lectures during the Preliminary and Regular Term, including clinical lectures	$140 00
Matriculation fee	5 00
Demonstrator's ticket (including material for dissection)	10 00
Graduation fee	30 00

FEES FOR THE SPRING SESSION.

Matriculation (Ticket good for the following Winter)	$ 5 00
Recitations, Clinics, and Lectures	35 00
Dissection (Ticket good for the following Winter)	10 00

Students who have attended two full Winter courses of lectures may be examined at the end of their second course upon Materia Medica, Physiology, Anatomy and Chemistry, and, if successful, they will be examined at the end of their third course upon Practice of Medicine, Surgery and Obstetrics only.

☞ For the Annual Circular and Catalogue, giving Regulations for graduation and other information, address,

PROF. AUSTIN FLINT, JR.,
Secretary, Bellevue Hospital Medical College.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion, may therefore be regarded as Chyle obtained by nature's own process.

In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatizing Cod-Liver Oil, the active digestive priciple of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Peptodyn, the New Digestive, is a combination of the whole of the digestive secretions—Pepsine, Pancreatine, Diastase, &c., forming an invaluable remedy in the treatment of all forms of Dyspepsia, and all diseases arising from imperfect nutrition.

N.B.—*The success of this Remedy has led to several imitations of it*, which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

Tins, 1/-, 2/-, 5/-, 10/-

AS SUPPLIED TO

THE ROYAL NURSERIES

of England, Russia, Etc.,

AND CONTAINING THE

HIGHEST AMOUNT OF NOURISHMENT

IN THE

MOST DIGESTIBLE AND CONVENIENT FORM.

THE MOST PERFECT SUBSTITUTE FOR HEALTHY MOTHER'S MILK.

DATURA TATULA FOR ASTHMA, ETC.

A powerful and universally adopted Remedy.

"By immediate contact with the air cells and passages, instant relief is given."—Dr. LATHAM, *Physician to the Queen.*

"A remedy of great power and usefulness in Asthma, Chronic Bronchitis, &c."—Dr. W. BARKER.

"The smoke causes no nausea. I have never known an instance in which relief was not obtained."—GENERAL ALEXANDER.

In Tins, for use by means of a pipe, Cigars and Cigarettes, and Pastilles for Inhalation.

SAVORY & MOORE, 143 New Bond Street, London.

Agents for America—E. FOUGERA & CO., NEW YORK.

1868. Silver Medal.

1872. Gold Medal.

Vienna. 1873. Medal of Merit.

Phila., 1876. Medal of Merit.

BOUDAULT'S PEPSINE

In POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is sold in 1 ounce, 8 ounce, and 16 ounce bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France)

DRAGEES, ELIXIR, AND SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hopitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily because of its agreeable taste.

Prepared by CLIN & CO., Pharmacists, Paris.

LA PLATA EXTRACT OF MEAT.

CH. DELACRE,
Sole Consignee,
IXELLES, BELGIUM.

Agents for the U. S.,
E. FOUGERA & CO.,
NEW YORK.

This Extract is a pure extract of Beef, prepared according to the improved process of Baron von Liebig, unsurpassed in quality, free from fat and gelatine, each pound of which contains the soluble nutritive constituents of 34 to 36 pounds of the finest beef, exclusive of bones and fat, corresponding to about 45 pounds of good butcher's meat. As a medicinal agent it will be found of great value to the sick, invalid, and persons and children of weak constitutions. ***It will keep unaltered for years in any climate.***

CAUTION.—Physicians wishing to use a pure extract of beef will do well to specify the ***"La Plata,"*** since it is never offered for sale until it has been analysed by Mr.

CH. DELACRE, Chemist, General Consignee at Brussels,

and found by him to possess the essential qualities of the best articles of this kind.

None genuine without the above trade-mark—*Bullock reclining.*

DOCTOR GIBERT'S

Depuratory Syrup and Dragees of Iodized Deuto-Iodide of Mercury

These preparations have been approved by the Academy of Medicine of Paris, and have been thoroughly tested in the hospitals of Paris in the treatment of *Syphilitic, Scrofulous* and other affections requiring the use of iodized remedies.

They are recommended for the utmost accuracy of composition, and their perfect preservation.

Prepared by VAUQUELIN-DESLAURIERS, Chemist, Paris.

E. FOUGERA & CO., Agents, New York.

"CROMWELL HALL,"

A PRIVATE HOSPITAL FOR THE INSANE

And NERVOUS, recently opened by W. B. HALLOCK, M.D., late First Assistant Physician of the "Connecticut Hospital for Insane."

Refers to A. M. SHEW, M.D., Supt. Conn. Hospital for Insane; SAMUEL LYNES, M.D. (Norwalk, Conn.), late Trustee of the same; J. S. BUTLER, M.D., Ex-Supt. of "The Retreat," Hartford, Conn.; ROBERT HUBBARD, M.D., Bridgeport, Conn.; DRS. E. & E. C. SEGUIN and THOS. R. POOLEY, New York; S. D. BROOKS, M.D. (Springfield, Mass.), Ex-Supt. of the "New York Juvenile Asylum," and the "New York Institution for the Deaf and Dumb;" DRS. H. R. WILBUR and JOHN VAN DUYN, Syracuse, N. Y.

Application may be made to *DR. HALLOCK*, Cromwell, Conn.

PRIVATE INSTRUCTION IN

AURAL DISEASES,

At the NEW YORK EAR DISPENSARY, 460 W. 16th St., cor. 9th Ave

By SAMUEL SEXTON, M.D.

Course, 20 Lessons. Class limited to Five. Fee, $20.00 each.

For further information, inquire at 12 West 35th Street.

SUNNYSIDE.

A PRIVATE MEDICAL HOME FOR NERVOUS INVALIDS.

Washington Heights, New York.

This Home, unsurpassed for its beauty of location and surroundings, and with handsomely furnished apartments, receives a limited number of cases of either sex, of *Mental* and *Nervous Diseases*, *Dipsomania* and *Opium Habit*, and offers to such patients all the attentions, comforts and attractiveness of a home, together with medical treatment. Applications may be made either by mail or personally at 153d St., bet. 10th Ave. and Boulevard.

Twelve trains daily from Hudson River Depot, 30th St. and 10th Avenue. DR. EDWARD C. MANN, M.D., late Medical Superintendent N. Y. State Emigrant Insane Asylum. DR. WM. H. B. POST.

PRACTICAL INSTRUCTION IN

CUTANEOUS AND VENEREAL DISEASES,

AT CHARITY HOSPITAL, BLACKWELL'S ISLAND, N. Y.,

By H. G. PIFFARD, M.D.

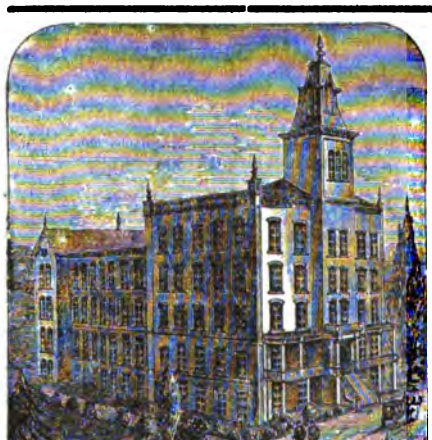
Course, 20 Lessons. Class limited to Three. Fee, $50.00 each.

For further information, apply at 10 WEST 35TH STREET, CITY.

FOR SALE,

At a Nominal Price,

The Personal Property and Practice of a well established Physician worth $8,000 to $10,000 a year. Only 30 minutes from New York. Or, Practice will be sold alone. The right man may secure a Hospital Service. Address R, *Medical Record.*



THE INEBRIATES' HOME, Fort Hamilton, L. I., N. Y.

(INCORPORATED 1866.)

President and Consulting Physician—THEODORE L. MASON, M.D., also President of the American Association for the Cure of Inebriates, and the Collegiate Department of the Long Island College Hospital. Attendant Physician—L. D. MASON.

The Buildings are constructed for this special purpose, and they are more complete, better furnished, and better adapted for the treatment of dipsomania than those of any other institution in existence.

The Management is systematic, thorough and adequate. There has been no change in the staff of medical or other active officers since the inauguration of the Home, nearly ten years ago.

The Classification is more perfect than, and the beneficial results are fully equal to, those of any other kindred institution.

Boarder Patients are classified according to accommodations required, and the charges are proportionately adjusted. Their departments are divided up into several floors, each containing such accommodations as the patients or their friends are willing to pay for. There are separate dining-rooms, lodging-rooms and parlors, billiard and bath-rooms. There is also a lecture-room for religious services, readings, concerts, etc. Several periodicals and daily papers are regularly taken. For the treatment of the better class of female patients an entire floor is set apart, handsomely furnished, having separate approaches, effectually isolating the sexes.

Remarkable Immunity from Death. The total death-rate since the opening has been one-half per cent., or one death for every two hundred patients. The total deaths of legitimate cases for treatment in the Home has been only one case in eight hundred during the same period. The rest were dying when admitted.

Patients are received either on their voluntary application, or by due process of law, and the powers of the charter to retain them within the limits of the grounds of the Institution are strictly enforced. For mode and terms of admission, apply to Rev. J. WILLETT, Secretary and Superintendent, at the Institution, Fort Hamilton (L. I.), N. Y.

Instruction, Retreats, Private Hospitals, &c., &c.

TO ADVERTISERS.—Cards inserted, under the above headings, at the rate of 20 cents per line, column width, Nonpareil type. *No Advertisements taken for less than Ten Lines.*

PRIVATE INSTRUCTION IN

PRACTICAL GYNECOLOGY

At MT. SINAI HOSPITAL, OUT-DOOR DEPARTMENT,

By PAUL F. MUNDE, M.D.,

For graduates only. Course 12 lessons of two hours each. Fee $20.00. For further information, apply to

DR. MUNDÉ, 30 West 45th St., New York.

Works of Prof. Alfred L. Loomis, M.D.,

Professor of Pathology and Practical Medicine in the Medical Department of the University of the City of New York; consulting Physician to the Charity Hospital, to the Bureau of Out-Door Relief, to the North-Western Dispensary, to the Central Dispensary; Late Visiting Physician to the Blackwell's Island Fever Hospital; Visiting Physician to Bellevue Hospital, to the Mount Sinai Hospital, &c., &c.

LESSONS IN

Physical Diagnosis.

THIRD EDITION. REVISED AND ENLARGED.

In one handsome octavo volume, cloth, $3.00.

NOTICES OF THE PRESS.

"The previous editions of this volume have been very well received, and, from their ready sale, appear to meet a well-recognized want. . . . We find the plan of the work excellent, and, within the limits proposed by the author, very well carried out. It would be easy to point out many omissions; completeness and conciseness to a certain degree exclude each other; but in the space assumed, it would be difficult to include a greater variety and amount of sound teaching. The style is compact, clear, positive, and exact. It is free from all irrelevant discussions; nothing is allowed to disturb or confuse the distinct image of clinical facts. . . . The book is very creditable to its acute and industrious author: and whoever shall practically master its contents cannot fail to be a discriminating and well-furnished diagnostician."—*The Medical Record.*

"For students it is the best work on physical diagnosis that is published."—*Detroit Review of Medicine.*

"This is a work already well and favorably known to the profession. In the present edition the original text has been entirely revised and enlarged by the addition of five new lessons."—*Chicago Medical Examiner.*

"Students of medicine and practitioners will find this just the work to meet their wants on the subjects of which it treats. Its instructions are full and very plain."—*Cincinnati Medical News.*

"The previous editions of the work, confined to an exposition of the subject of physical exploration of the chest and abdomen, we have regarded as among the very best works on the subject extant, and hence recommended 'Loomis on Physical Diagnosis' to our classes: and it gives us pleasure to repeat, in this form, our hearty commendation of the book."—*Mich. University Medical Journal.*

LECTURES ON

Diseases of the Respiratory Organs,

HEART AND KIDNEYS.

In one handsome octavo volume of over 550 *pages. Price, in extra muslin,* $5.00; *or, in leather,* $6.00.

NOTICES OF THE PRESS.

"It is clear in style, convential in arrangement, very definite and practical in its teachings."—*Philadelphia Medical Times.*

"We like the systematic method in which these lectures are arranged, and regard them as excellent in every way."—*Cincinnati Lancet and Observer.*

"By all means buy Loomis' work and *study* it."—*Ohio Medical and Surgical Reporter.*

"In the one before us the reader may look confidently for the last words on the subject, and may rest assured that what the author has here committed to the press is the result of much learning, sound judgment, and thorough experience."—*American Practitioner.*

"We have no hesitation in pronouncing it one of much value to the profession, and highly creditable to the author."—*New York Medical Journal.*

"While the views presented are fully up to what is actually known on the subjects treated, the doctrines are judicious and safe. At the same time they are presented with unusual clearness, and with sufficient positiveness to command confidence."—*New Orleans Medical and Surgical Journal.*

LECTURES ON

FEVERS.

In one handsome octavo volume. Cloth, $4.00; *Sheep,* $4.75.

NOTICES OF THE PRESS.

"We have before us, therefore, a book containing statements of practical facts relating to certain diseases, and the theories regarding their nature, mode of origin and propagation, and arranged so as to be easily comprehended by the medical student. We also believe they will be read without weariness by the daily practitioner. . . . It contains much practical knowledge, and cannot fail to be read by a very large proportion of the medical profession; for a concise statement of facts—with only such qualifications as can be safely indulged in without endangering perspicuity—is always acceptable."—*The Medical Record, Nov.* 24, 1877.

"This last work of Professor Loomis' is a valuable contribution to medical literature. His treatment of the subject is mainly practical, and is in strict conformity with what the author has himself observed at the bedside. The general management of fever is justly regarded of greater importance than the administration of drugs. It is a book that will well repay careful study."—*Western Lancet, January,* 1878.

"The work is clearly and concisely written, and will be useful and acceptable to both student and practitioner."—*N. Y. Medical Journal, March,* 1878.

"In this interesting volume, which contains the lectures on fevers delivered by Professor Loomis to his class during the last year, we have a concise and impartial review of the literature concerning fevers, which has been published since 1850 with reference to a few older books, 'because they contain many of the so-called new theories and modes of treating fevers.' In this are embodied the results of the author's own extensive clinical experience, which has led him to form opinions in certain respects at variance with those of some other observers; and the weak points of theories and modes of practice which have not stood the test of time, are clearly set forth."—*Boston Medical and Surgical Journal, Dec.* 22, 1877.

WM. WOOD & CO., Publishers, 27 Great Jones St., New York.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

K. & M.

Improved Extract of Malt.

Made from Canada Barley, selected, malted, dried, and extracted by, and under the immediate supervision of, Graduates of the Philadelphia College of Pharmacy. CONCENTRATED IN VACUO. This is as perfect an extract of the highest grade of carefully selected Barley Malt as can be PREPARED BY THE USE OF THE MOST IMPROVED VACUUM APPARATUS, recently designed for our own laboratory. As A FOOD in Syphilis, Typhoid and other fevers, Consumption and similar wasting diseases, it is without an equal for the rapid building up of a degenerate or depraved condition of the blood or tissues, since it acts not only as food itself, but its use converts and changes other kinds of food into a condition allowing easy assimilation.

We append the following letter from a gentleman well known to all:

Messrs. KEASBEY & MATTISON: PHILADELPHIA, *September* 25, 1877.

Gentlemen.—I have employed your Extract of Malt and Infants' Food in a large number of cases, much to my own satisfaction and to the benefit of the patient. The Infants' Food I regard as especially useful in cases of infants requiring artificial food from any cause. Yours, etc., W. B. ATKINSON, *Secretary American Medical Association.*

K. & M.

Extract of Malt with Cod Liver Oil.

ORIGINATED BY KEASBEY & MATTISON.

THE MOST NUTRITIVE EMULSION EVER MADE.

Our Improved Extract of Malt, with 50 per cent. of our fine Norwegian Oil, is pre-eminently the emulsion of Cod Liver Oil, since it has double the nutritive effect of any other emulsion of oil. It not only contains the largest amount of nutritive food in the smallest bulk of liquid, but, by the action of the Diastase contained in the malt, it is capable of transforming many times its bulk of amylaceous or graminaceous food into saccharine, thus rendering it easily digestible even by the most delicate stomach of the invalid. The disagreeable eructations from the stomach, which constitute one of the greatest objections to the use of all preparations of Cod Liver Oil, are completely obviated in this preparation. We would direct the attention of physicians to the special fact that it unites perfectly with water in any proportion, and that the oil does not again separate, thus showing how perfectly the oil is emulsified.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Improved Extract of Malt with Pepsin.

This is our Improved Extract of Malt, with the addition of five grains of our Saccharated Pepsin to the tablespoonful. For dyspeptic disorders it is found of great value, since it digests both albuminoid and amylaceous matter, thus furnishing a preparation that is needed in the majority of cases of dyspepsia and other derangements of the stomach dependent upon the non-assimilation of the food.

Dose.—A Dessert to Tablespoonful immediately after Meals.

K. & M.

Beef, Iron, and Wine, with Extract of Malt.

ORIGINATED BY KEASBEY & MATTISON.

A NOURISHING DIET FOR INVALIDS AND CONVALESCENTS.

As a simple restorative food, where a tonic effect is desired, there is perhaps nothing in the whole line of tonic dietetics of so much real value as this preparation. It furnishes the diseased stomach with the power of assimilating amylaceous diet, and supplies readily assimilable food at the same time, in the articles of Malt Extract. The iron salt supplies the red corpuscles that are deficient in the blood, while to the nutrient effect of beef is added the stimulant effect of a fine sherry wine. Each tablespoonful represents two grains of the soluble citrate of iron, and one ounce of finely-chopped raw lean beef, with equal quantities of our Improved Extract of Malt and sherry wine.

For sale by Druggists everywhere. Samples may be obtained of

THE MANUFACTURERS,

KEASBEY & MATTISON,

332 N. Front Street, Philadelphia.

ALWAYS SPECIFY "K. & M." IMPROVED EXTRACT OF MALT.

WARNER & CO.'S
SUGAR-COATED QUININE PILLS.

(With Twenty-Six Combinations.—See List.)

QUININE PILLS of our make are prepared from *Sulphate of Quinia* of American manufacture, noted for its purity and excellence. Each Pill contains the full complement of material as expressed on the label, without the necessity of adding any excess to compensate for impurities. They are perfectly soluble, and physicians can depend upon getting the full benefit of this valuable remedy in a pleasant form.

SUGAR-COATING, properly applied, does not impair the quality of such medicines as are commonly thus enclosed. *Dr. W. S. Edgar, Editor, says:*—"We procured a variety of W. R. WARNER & Co.'s preparations, and have prescribed them as opportunity offered, with *satisfactory evidence of their purity*, and reliability as to the quantity in each dose; also, we extract the following paragraph from a letter by a competent analytical chemist:"—

SUGAR-COATED QUININE PILLS.

"I take pleasure in testifying that W. R. WARNER & Co.'s QUININE PILLS are practically just what they claim to be, whether judged by analytical tests or by the therapeutic effect obtained from their use.

DETROIT, MICH. "A. B. LYONS, M.D., *Analytical Chemist.*"

WILLIAM R. WARNER & CO., Manufacturers of Sugar-Coated Pills,
1228 Market Street, Philadelphia.

SCOTT'S EMULSION
PURE COD LIVER OIL
WITH
HYPOPHOSPHITES OF LIME AND SODA
PERFECT, PERMANENT, PALATABLE.

FORMULA.—50 per cent. Pure Cod-Liver Oil, 6 grains of Hypophosphite of Lime, 3 grains of Hypophosphite of Soda to a fluid ounce.

We respectfully recommend this preparation to the medical profession, knowing they will find it of the greatest value in the wasting diseases indicated by a defective nutrition. The oil is so incorporated that the nauseous taste and smell is entirely removed, enabling the most delicate stomach to bear it. But its especial advantage over all other combinations is the perfection and permanency of the Emulsion. We will be pleased to send a sample by express, prepaid, to any physician in the country, if he cannot obtain it at his druggist's.

SCOTT & BOWNE, Manufacturing Chemists, 125 Hudson St., New York.

NEW YORK, *Sept. 4th*, 1876.

Messrs. SCOTT & BOWNE.—*Gents:* I have prescribed Scott's Emulsion of Cod-Liver Oil with Hypophosphites, in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather; and is more palatable than any other preparation of oil that I have used. Yours very respectfully,

ROBERT WATTS, M.D., *President Medical Board Charity Hospital.*

BEDFORD (VA.) SPRINGS WATER & MASS.

Standard Natural Remedies endorsed by Medical profession for Throat, Skin, Stomach, Blood and Uterine Diseases. Efficiency attested by results in thousands of cases during the last 25 years. Original Lectures.

LECTURES ON FEVERS.

By ALONZO CLARK, M.D.,

PROFESSOR OF PATHOLOGY AND PRACTICAL MEDICINE IN THE COLLEGE OF PHYSICIANS AND SURGEONS IN THE CITY OF NEW YORK.

(Reported for THE MEDICAL RECORD.)

LECTURE II.

TYPHOID FEVER (CONTINUED)—SYMPTOMS—TREATMENT.

GENTLEMEN:—In the concluding part of the last lecture we were studying the symptoms of typhoid fever. We will continue the same subject to-day, and the next symptom to be described is the *eruption*. This makes its appearance on the seventh or eighth day from the first chilly feeling. It sometimes occupies the entire body, and in some cases it is chiefly found upon the abdomen and upon the back. It can usually be seen upon the chest also, and sometimes upon the limbs. It rarely occurs upon the face. The eruption consists of small red spots, not more than a line and a half or two lines in diameter. These spots may be so numerous as almost to run together, or they may be so few in number that you will be obliged to search diligently to find them. The eruption is not attended by pain, itching, or any peculiar sensation. The spots remain red or rose-colored until they disappear; and they disappear pretty quickly. During its entire existence each spot can be bleached by the pressure of the finger, but the color will return as soon as the pressure is removed. In this respect it differs from the eruption of typhus fever. It differs from the typhus eruption in another respect; the typhus eruption disappears through some shades of yellow staining, and that staining is due to changes which occur in the coloring matter of the blood, but as there is no effusion of blood in the eruption of typhoid fever, the yellow discoloration does not appear. The eruption disappears at the end of a week; but disappearing, sometimes a new crop of the eruption makes its appearance. Mr. Louis, in studying this point, made markings upon the surface with nitrate of silver for the purpose of ascertaining whether the new eruption appeared on the precise site of the old, or whether it occupied new positions. He found that the sites occupied by the old spots were not occupied by the new ones, but that it was a new eruption occurring on new sites. The eruption is not always present, and its occurrence is much less frequent in this country than in France. Still, we always search for it, and when it is found we recognize in it a very valuable diagnostic indication.

A few words must be added to what has been said regarding the *temperature* in typhoid fever. It has been claimed within the last few years that there is a special mode in which the temperature of typhoid fever increases. For example, it is claimed that at the beginning of the fever the advance is gradual until it reaches its maximum; that it remains at the maximum height until the fever begins to abate; then the morning remissions become more and more marked, and finally the normal standard is reached. On the second day of typhoid fever the temperature in the morning should, according to this doctrine, be 101° F., in the evening of the same day 102° F. On the morning of the next day it should be 102° F., and in the evening of that day 103° F. Again, on the morning of the following day it should be 103° F., and in the evening 104° F. By the *fifth* day of the disease, then, the temperature may have reached 104° F. in the morning, and 105° F. in the evening; at least the rise in temperature is said to be gradual until the highest point is reached. The highest point being reached it remains about the same, with daily variations, a remission in the morning and an exacerbation in the evening during the second and third weeks. That feature I have noticed—namely, that there is but little subsidence of the temperature during these weeks, and that when it does begin to abate the morning remission becomes more marked. For three or four days before the fever comes to its termination there will be between the morning and evening temperature, instead of a variation of only one degree or a degree and a half, a variation perhaps of three or three and a half degrees. Such a fever is defervescing, as the technicals say. Since this observation regarding the gradual rise of temperature in the early days of typhoid fever was announced, I have given particular attention to it. It is true, that we have not had many cases of typhoid fever in the city within the last two or three years, so that the opportunity for observation has been rather scanty. But in the instances in which it has been observed this precise mode of increase in temperature has not been noticed. We noticed very frequently a great variation between the morning and evening register, as the temperature began to subside, but there was not the regular advance mentioned as occurring in the initial days of the disease.

There has been one embarrassment in this respect, however, for I see cases of typhoid fever, as they occur outside of hospitals, only in consultation, and then the disease is generally pretty well advanced. I have, therefore, had few good opportunities to study this rule in private practice. In the hospital we do not commonly get the cases until the end of the first week, and that is at the end of the time when this important observation should be made. We had one case which originated in Bellevue Hospital from some unknown cause, and we had the opportunity to make the requisite observation, but it did not come under the rule relating to the steady increase of the initial temperature. It may be, therefore, we shall be obliged to study anew the temperature of typhoid fever as it occurs in this country.

Now let us take a case in the third week of severe and dangerous typhoid fever. We shall find the patient with a pretty rapid pulse, and yet the pulse throughout the course of an average case is not rapid. A great many patients go through an entire course of the fever with a pulse never exceeding 100. But in the supposed case the pulse is perhaps 120 or 130. The countenance is dull; the patient is inclined to stupor; has but little perception of what is going on around him; possibly is comatose; perhaps has the *coma vigil* which is seen in typhus fever; he is inclined to slip down in the bed; he is probably quite deaf; if pinched, he does not feel it very much; his sight is obscure; his mouth is filled with sordes; his tongue is dry and cracked, or it has the color of beef; the evacuation from the bowels occurs without his knowledge; the urine is retained in the bladder until it forces its way by drops from the urethra; the respiration is pretty rapid; and there is more or less fall in the temperature.

When this condition has been reached, the man is very likely to die; but, at the same time, with these symptoms a few do get well. A great many thousands,

however, go through typhoid fever with the development only of symptoms of moderate severity, and those cases usually recover.

DURATION OF THE DISEASE.

The duration of this disease is about four weeks; and yet I have seen a woman who had symptoms of typhoid fever for 120 days. It was on the one hundred and twenty-first day that I saw her, and there had been no marked defervescence at any time during her sickness. How was the case to be explained? The explanation is that she had a fever resulting from the lesions of typhoid fever just described as affecting the glandular structures of the intestines, the mesenteric glands, and the spleen. The disorder of the spleen may not yield readily; the alterations in the intestines may hold on, and produce a diarrhœa which lasts for a long time. The lesion of the stomach may be more prominent in certain cases than in others, and the lesion of the lungs may hold the patient down for an unexpected period of time. The typhoid fever proper does not extend beyond four weeks; the period of communicability is not probably more than six, and what of fever and sickness is continued beyond that time is probably free from the danger of communicating the disease.

NATURE OF THE POISON BY WHICH THE DISEASE IS SPREAD.

Next with regard to the nature of the poison by which the disease is spread. From several instances which I have cited in which a disease resembling typhoid fever has been produced by dejection from a typhoid patient mingled with water in various ways, it is pretty certain that these dejections are capable of poisoning well persons. Then the question arises, are they capable of poisoning well persons simply because they carry some general poison that is disseminated or diffused about the sick person, or is it that some fermentation occurs in the dejections, and thus produces the poison? This latter is the doctrine of to-day. It is farther claimed that there is no diffusion of poison about the patient, except such as comes from the clothes that have been soiled by fæces. That point is not yet settled, and requires farther study. It is a point, however, of great importance, and one which has a direct bearing upon the management of the patient.

ABORTIVE CASES OF TYPHOID FEVER.

A word with reference to abortion of the disease. There are some abortive cases of typhoid fever. The disease runs on for a few days and then spontaneously subsides, not running through its regular course. The abortive cases are seen more commonly among children than among adults.

It has been known for a long time that infantile remittent fever is typhoid fever. For, when the disease exists for a certain length of time, there are found, at post-mortem examination, the same lesions found after typhoid fever occurring in adults. I have over and over again seen this fever in children terminate in nine days; and not infrequently in seven days. Occasionally the same thing occurs in the adult; possibly because the system is not susceptible of the disease to the same degree as in other persons; possibly because there may be some protective influence from some other fever; or the person may have had a previous attack of typhoid fever.

ACCIDENTS OF TYPHOID FEVER.

There are certain accidents liable to occur in the course of this disease, which require some attention. Persons having typhoid fever are liable to *abscess*, and a rather favorite seat of abscess under these circumstances is the region about the parotid gland; it is a peri-parotiditis. It usually occurs, if developed at all, in the second or third week, and when the inflammation has once commenced it almost always advances to suppuration. It occasionally happens that inflammatory abscess occurs in other parts of the body. But there is another kind of abscess to which the typhoid fever patient is liable; it is called the *cold* abscess. Such an abscess may occur upon the arm, over the sternum, perhaps upon the leg, but more frequently upon the upper part of the body.

There is little or no evidence of the existence of an inflammatory process as shown by heat, redness, or pain, but a swelling and fluctuation is usually the first thing noticed. Once observed, it is found that the abscess advances, dissects up the muscles, and, if left to itself, it will be found that a great deal of mischief will be done.

Hemorrhage from the bowels is liable to occur in the course of typhoid fever. I attended 100 cases of the disease before I saw one in which hemorrhage from the bowels took place, and I began to feel that the importance of this accident, as regards its frequency, was greatly exaggerated. But just then the cases came in a kind of shower; several came under observation in pretty rapid succession. The hemorrhage is of two kinds; first, that which occurs early in the disease; and second, that which occurs late, sometimes even during convalescence. When it occurs early, my conviction is that it is not because of gangrene of the intestine, as Niemeyer says, but that it is from hyperæmia in the parts where ulcers are forming. The ulcers have not yet formed; there is no destruction of blood-vessels, and this early hemorrhage is apt to be quite innocent. The hemorrhage which is most alarming is that which occurs in the manner referred to, by the destruction of a blood-vessel of moderate size, as an ulcer advances. When it occurs during convalescence, it is evidence that the ulcers are not all healed when the fever subsides.

Of *perforation of the intestine*, perhaps sufficient has been said, except with reference to treatment.

MODE OF TERMINATION OF TYPHOID FEVER.

The disease terminates rather suddenly and in this respect resembles typhus fever. For example, you see the patient in the evening and find that his pulse, temperature, and the appearance of the countenance indicate the continuance of the fever, but at the morning visit you find that his face is pale, that his temperature and pulse have fallen, that his reason has returned, if he has previously been delirious, and when asked how he feels, he will answer, "Doctor, I am so weak!" the same as does the typhus fever patient. From that time he slowly recovers from the effect of the disease. His appetite returns; he is soon able to sit in a chair; and soon after he is able to walk. Recovery of strength, however, is almost always slow; it takes a month, perhaps two or three, and sometimes six months, to fully recover this.

With regard to the mode of termination of the disease, it is commonly in the manner described, but in a few cases termination occurs by *crisis*. In my own case, the first thing remembered after losing my senses was that four persons were moving me from one bed to another upon a sheet, and that I was dripping with perspiration; that perspiration lasted for an entire day. During its continuance I recovered my reason, and the doctor said, "You are better." After the

sweating ceased, I myself was conscious of being better and stronger.

There is a curious fact with regard to convalescence from typhoid fever, and that is, before the patient recovers his full strength, he often acquires an *unusual quantity of fat*. He looks as though he had sufficient strength, but he feels weak. It is to be noticed that this accumulation of fat all finally disappears, and the patient is brought back to the condition he was in previous to the occurrence of the fever.

There is another point with reference to the convalescence, and that is, the patient usually *loses his hair*. This may go on to such an extent that he becomes entirely bald. It is often the case that he becomes nearly bald; but there need be no apprehension regarding the permanency of the baldness, for the hair follicles remain, and a new growth of hair will be produced which will be nearly as good as the old.

TREATMENT OF TYPHOID FEVER.

We will now pass to the consideration of the treatment of typhoid fever. Active treatment of this disease has been long abandoned. It used to be the fashion to bleed, and also to produce ptyalism. I remember doctors who said with confidence that where they saw evidence of the special action of mercury in these cases, they were sure of recovery. But all that has been abandoned.

Again, there were doctors, and perhaps there are some now, who put great confidence in a purgative plan of treatment; or, perhaps more strictly, an emetico-cathartic plan. An emetic and cathartic were administered together, and the cathartic was always calomel. It was claimed by those who resorted to this plan, that in certain cases abortion of the disease has been actually produced. I doubt that. In the course of an epidemic of typhoid fever, cases of ephemeral fever occur. These terminate of themselves within a few days, and the general opinion now is that those cases which have been reported as aborted cases were really cases of ephemeral fever, or cases of themselves abortive. At all events, since "Graves fed fevers," the tendency in the profession has been to treat typhoid fever with as little medicine as possible.

I may safely say to you that a case of typhoid fever of average severity needs no medication except for the relief of certain symptoms, such as sleeplessness, perhaps a little urgency in the diarrhœa, sensation of burning upon the surface of the body, etc. There are a great many cases of typhoid fever which need no treatment whatever by way of drugs, but everything by way of management of the case. Still, it does happen in many of the cases that some one of the symptoms requires treatment. The *diarrhœa*, for example, in many cases requires restraint.

Diarrhœa does not occur in every case of typhoid fever in this country; perhaps it does not occur oftener than in two-thirds of the cases. But when it does occur, the usual remedies are serviceable here as in other forms of diarrhœa. The astringent which I have referred to so frequently is found to answer a very good purpose. It consists of:

℞. Bismuth. subnit..... ʒi.
Morphiæ sulph..... gr. i.
M. et div. in chart. No. xii.
One to four a day.

The common astringents tr. kino and tr. catechu may be employed, and the decoction of blackberry root is sometimes very serviceable. In some cases it requires the moderately free use of opium to restrain the diarrhœa.

There is always a *cough* in typhoid fever, but as it is not important in the average case, I have not mentioned it until now. There is slight bronchial irritation, which appears early in the disease, and continues usually until the period of imperfect anæsthesia is reached, when it may cease. The material raised is commonly a glairy mucus, but in some cases the slight bronchitis becomes a catarrh, and will require treatment. It will need the same treatment as bronchitis occurring under any other circumstances, except that the tonic expectorants will be most likely to do good. Perhaps one of the best that can be used is the *Co. Tr. of Benzoin*, in doses of ten drops on sugar once in three or four hours. A very good combination is the tincture of the balsam of tolu and the mistura guaiaci.

℞. Mist. guaiaci..... ʒj. to ʒss.
Tr. balsam tolu... gtts. vj. to x.
M.

This can be repeated every two, three, or four hours. Sometimes the inhalation of the vapor of warm water seems to be required for one or two hours each day.

Restlessness is one of the prominent features of the disease, and that will very frequently be entirely quieted by sponging the surface of the body with warm or cold water. If the temperature is high cold water is better than warm; and in some cases a Dover's powder will be required.

The *temperature of the body* will require your attention. In many cases of typhoid fever it does not rise to a dangerous point; in a few cases it does. You will see the greater number of cases go through the entire course of the disease without the temperature at any time reaching 105° F. In a case of average severity the maximum temperature is about 104° F.; in occasional cases it reaches 106° F. or 107° F., and then you will either give quinine in pretty decided doses or use cold water for its reduction. If the patient is a young person, the cold bath is the most convenient means for reducing the temperature, and certainly the most efficacious. The temperature of the bath should be only ten degrees below the temperature of the body when the patient is first put into it. If the temperature of the body be 105° F., the patient may be placed in a bath having a temperature of 95° F.; then some of the warm water can be removed, and be replaced by cold water until the bath has been reduced to 80° F. If the patient is permitted to remain in such a bath twenty minutes, the temperature is usually reduced 1, 2, 3, 4, or even 5 degrees.

He is then removed from the bath, put back into bed, and it will be several hours, usually, before the temperature will rise as high as it was before using the bath. When it rises, another bath is to be given, and in that manner you will go on repeating the bath as often as may be necessary to keep the temperature below the point of danger.

The son of one of the professors in this college has within the present session had typhoid fever. In his case the bath was used about five times a day for several days, and always with the result of reducing the temperature and affording great relief to the patient.

For the *hemorrhage from the bowels* there is but little that can be done, unless, in addition to absolute rest, the fluid extract of ergot be administered.

For the *perforation of the bowels*, I have some faith in the opium treatment. As I told you, I feel confident that I saved one doctor's life by the narcotizing influence of opium, and there is no objection in typhoid fever to the administration of this drug.

"Graves fed fevers," typhoid fever as well as typhus; and now we come to the two essentials in the treatment

of this disease. I am in the habit of repeating the old proverb, "Stuff a cold, and starve a fever," and then add that we stuff them both now. First, then, the administration, steadily and perseveringly, of such food as can be absorbed by the stomach. We cannot talk much of digestion; the stomach is in a diseased condition, and cannot digest well, consequently everything solid in the way of food is out of the question. Most of these patients dispose of milk pretty well. For all those who can dispose of it, milk is the best food that can be used. For those who cannot use it, you will be obliged to do the best you can with beef-tea, raw egg beaten up with water, and made of such consistency that it can be taken with a spoon; and the expressed juice of beef. The beef-tea does not contain a great deal of nourishment, and when it can be used, milk is a much better article of food.

The expressed juice of beef answers very well, and can be obtained by cooking a piece of steak so as just to crust the two surfaces, and then cutting it into pieces and squeezing the juice out with a lemon-squeezer. The broths are given rather as diluted food in the early part of the disease, when it is supposed that the patient should not take much nourishment, but as the disease advances, the food should be more and more sustaining. In cases in which the stomach fails to retain food, nutritious enemata should be employed. You will remember that the disease which produces the diarrhœa, is in the small intestine, not in the large.

The other essential of which I wish to speak is *fresh air*, but I will reserve that for the opening of the next lecture.

THE OPERATION OF LAPARO-ELYTROTOMY.

By MONTROSE A. PALLEN, M.D.

BEING REMARKS MADE AT A MEETING OF THE NEW YORK ACADEMY OF MEDICINE, MARCH 21, 1878.

MR. PRESIDENT:—After the publication of Prof. T. Gaillard Thomas's first paper on this subject, at a meeting of the American Medical Association held in Philadelphia, five years ago, I then strongly advocated "laparo-elytrotomy," and predicted that it would ultimately take the place of the Cæsarean section as usually performed in cases where the integrity of the uterine neck existed. From the tenor of the remarks uttered this evening in the Academy, I felicitate myself that I was so fortunate as to recognize its advantages, so skilfully demonstrated since 1873 by Professors Thomas and Skene, in the successful issues of operations under their hands. Hereafter the obstetric surgeon will approach a labor demanding craniotomy or abdominal section, with a degree of confidence in the result hitherto unknown. The statistics of saved mothers will be most materially benefited, and I hope the "slaughter of the innocents" will be of the past. The destroying angel will seldom sprinkle the door-posts with the sacrificial blood by and through the murderous perforator and craniocast. Henceforward, with the perfection and promulgation of laparo-elytrotomy, so admirably executed by Professor Thomas, many of the trials and tribulations of the accoucheur will be obviated, and I, for one, most heartily thank him for the valuable work done in what has heretofore been regarded as the most dangerous and hazardous of surgical procedures, because it involves two lives instead of one. The Cæsarean section is as old as medicine itself, for, if we are to believe Ovid, Esculapius himself was cut from his mother Coronis by Apollo, after he had slain her for infidelity. Bacchus likewise was removed by Mercury from the belly of Semele, after she had been destroyed in the embraces of Jupiter. Virgil mentions in the Æneid that Lycus was thus snatched from the dead body of his mother. These poetic fables, together with the *lex regia* of Numa Pompilius (wherein it was ordered that no pregnant woman should be interred until her abdomen was opened, lest the child be alive), as well as a passage found in the seventh book of the ninth chapter of Pliny, lead us to believe that *Cæsarism* was frequently practised among the Greeks and Romans. Scipio Africanus, Manlius Carthagenius, and Julius Cæsar were said to have been thus delivered. If it were true of Cæsar, his mother Aurelia survived the operation, as she was alive when he returned to Rome after his expedition to Britain. Mansfield relates that the Semitic races not only practised gastro-hysterotomy, but in the chapter *Mischjoth* of the Talmud it is expressly stipulated that the Israelitish women subjected to the operation were to be exempt from the forty days of purification required of lying-in women, and that a child so born had none of the rights of primogeniture. Shakspeare utilizes the traditional superstition when Macbeth declares his belief in the witches, and says:

> "I bear a charmed life, which must not yield
> To one of woman born."

And Macduff replies:

> "Despair thy charm,
> And let the angel whom thou still hast served
> Tell thee Macduff was from his mother's womb
> Untimely ripped."

The first recorded operation upon the living subject is related by Rousset as having taken place in 1500, when Jacopus Nufer, a sow-spayer, operated upon his wife, Elizabeth Alepaschin, in the Department of Siegershausen, Turgovia. This man received a special permit to operate from the local magistrate, after the midwives and physicians had declared it impossible to deliver the woman. Strange to say, Elizabeth afterwards bore several children *per vias naturales*.

After the publication of Rousset's book on *Hysterotomokia* (Paris, 1581), the profession began to investigate what had been said upon the subject, more particularly with regard to the woman Godon, whom Rousset declared to have been operated upon seven times, and to the case Lenoir and Lebrun opened in three successive pregnancies. The facts were also sought concerning Nicole Béranger, who is described by Paré and Schenck to have been delivered, two years after an alleged section, of a daughter, and subsequently a son. The statements of Rousset, Bauhin, and Simon were not believed to be absolutely correct, although they collated over sixty operations. Guillemeau failed twice, and Viart, Brunet, and Charbonnet each lost a case. Mauriceau, at first favoring it, afterwards looked upon it as an impossibility, "notwithstanding the statements of several impostors," although the section by linea alba is still known as his method. Peu declared he had no desire to perform it, and Dionis thought any surgeon who practised it upon the living subject should be punished. Delamotte, although he had once witnessed a successful issue at the hands of a surgeon of Pont-L'abbé, was as bitter in his denunciations of Rousset as was Deventer loud in his praises.

In the last decades of the seventeenth and in the earlier ones of the eighteenth centuries, continental obstetric literature teemed with disputive dissertations on the Cæsarean section.

Baudelocque, however, has collected ninety-three cases, of which nine were successful prior to 1750, and twenty-four from that date to 1787. Velpeau also published an additional table of about fifty more successes by various French, German, Dutch, and Italian surgeons, bringing the dates up to 1830. But from 1750 to 1830 very many writers have recorded fatal issues. Thus, in Baudelocque's table of ninety-three cases, sixty were fatal either from the operation or from conditions coincident therewith. Spreng-l says that sixty-one were fatal of the one hundred and six cases collated by him. Kelly and Hull record even greater mortality, one hundred and twenty-three dying out of two hundred and thirty-one sections. The British obstetricians have, until recently, but rarely performed laparotomy, either from a dread of the magnitude of the procedure or because they were wedded to craniotomy. A question well worthy of study is this peculiar fixedness in English, Scotch, and even Irish midwifery in favor of destroying the child by perforation or embryotomy, with the attendant dangers to the mother—very frequently fatal, as evidenced in the statistics of Blundell, Merriman, Burns, Rigby, Murphy, the Ramsbothams, Churchill, Simpson, and others. The British writers generally, prior to the last quarter of a century, either condemned the operation, or were so sparingly in favor of it that it may safely be said to be a *questio vexata*, if not a *questio damnata*.

Burns and S. Cooper did not know of one single successful effort in all Britain. Merriman, in his "Synopsis of Difficult Parturition," relates but one favorable result (that of Barlow). Denman never performed it, nor had he any knowledge of its performance in England. According to Hamilton, Fielding Ould declared Cæsarean section to be a "proof of detestable inhumanity, illegal and barbarous." It is not at all improbable that British obstetrics was in a measure controlled by the teachings of Smellie and Denman, and not a little because of the supposed religious influences governing the continental accoucheurs, as Baudelocque impressed the French and Italian schools with his profound convictions on the subject of baptism, which were distasteful to the anti-Catholic views of the Saxon, who was equally strong in his belief that the life of the mother should never be weighed as against her unborn infant. Whatever may have been the cause, the Cæsarean section found no home in Great Britain. May we not hope that the murderous sacrifice of so many infants will cease hereafter under the beneficent workings of laparo-elytrotomy. Had I been sooner permitted to know of this paper of Prof. Thomas, it would have been very gratifying to enter more into its merits, as well as details of the methods, indications, and performance of the Cæsarean section, the Sigaultian symphisotomy of the pubes, and the exsection of the branches of the pubic bones, first described by Aitken in 1785, then proposed by Desgranges and Champion, and afterwards performed by Prof. Catolica, of Naples, in 1825. This operation consisted of sawing out the horizontal rami of the pubes (bi-pubotomy); but the patient succumbed from peritonitis, and a dead child was delivered.

Whatever was hoped from these divisions of the pubic symphisis, as well as the removal of the pubic bones, resulted unfortunately; but they furnish most interesting chapters in the history of obstetric surgery. With regard to this operation of Prof. Thomas, of laparo elytrotomy, I wish to show that to him alone belongs all the credit for the new era inaugurated by its performance. Since his first paper on the subject in 1871, it has been frequently said that it was Ritgen's method, and for that reason I have particularly investigated the history of the procedure. It might as well be called Physick's and Baudelocque's (nephew). All three of these surgeons have proposed similar methods, but it is doubtful if any of them ever succeeded with it on the living woman. In fact, it is well known that in Baudelocque's operation (exactly as is Prof. Thomas's) he made a most signal failure, and had to complete the delivery by resorting to section through the linea alba.

Moreau, in his great work on midwifery, first published in 1840, speaking of the different methods of performing the Cæsarean section, records four different operations: "1st. That of Levret, or rather Rousset, which consisted in dividing the abdominal parietes parallel to the outer edge of one of the two recti muscles, preferring the left, at an equal distance from these muscles, and another line drawn from the extremity of the third false rib to the superior spine of the iliac bones. 2d. That of Mauriceau, adopted by Platner, Solayrés, Deleurye, and Baudelocque, in which the incision was made in the linea alba. 3d. That called after Lauverjat, although known prior to his time, consisting in a transverse incision from the outer edge of the rectus muscle to a level with the anterior superior spine of the iliac bones. 4th. Lastly, that which consists in making an *incision parallel to Poupart's ligament from the spine of the pubes, beyond the anterior superior iliac spinous process, pushing back the peritoneum from the iliac fossa into the cavity of the pelvis, opening the upper part of the vagina, bringing the os uteri opposite to the wound in the belly, and then abandoning the delivery to the efforts of nature alone, or assisting her either by the hand or the forceps.*"

After considering the three first described efforts, Moreau says: "The idea of those who wished to isolate the peritoneum and the organs contained in it, in order to prevent their injury, is worthy of all praise; but we do not see how this method is exempt from the objections made to the others. Is not equally acute inflammation liable to follow the tearing up of the peritoneum, as an incision made through it? Effusion into the abdomen, indeed, is not to be apprehended; but can this plan be readily followed in practice? Baudelocque the nephew, who attempted it once, failed, and was obliged to resort to Cæsarean section properly so called. And again, who will guarantee that, after its separation, the peritoneum will not be lacerated at the time of the passage of the child's head?"

These objections have been answered by the successful issues in the hands of Professors Thomas and Skene. In a supplementary paper by Paul Dubois (tr. Desormeaux's article on the Cæsarean section, in the *Répertoire Général des Sciences Médicales*, Paris, 1834), this distinguished accoucheur took very adverse grounds to this procedure. He says: "Since the publication of the article several new methods have been proposed hitherto unknown, which consist in the operations of Ritgen, Physick, and Baudelocque. Ritgen's method consists in an incision transversely dividing the great muscles of the abdomen above the iliac crest, and a separation of the peritoneum down to the superior strait, and then to divide the upper portion of the uterine neck under the serous investment. The procedure of Baudelocque (nephew) is in cutting parallel to Poupart's ligament, terminating at the anterior superior spine of the ileum, either on the right or left side, opposite to the uterine inclination. After dividing the abdominal walls and securing the epigastric artery, the operator rolls the peritoneal re-

flection of the iliac fossa up from the excavation, and frees the superior portion of the vagina, which he opens sufficiently to give free passage to the fœtus. A finger is then carried through the wound, by which the uterus is tilted towards the opening, whilst an assistant presses the body of the organ in the opposite direction. With the os uteri presenting to the wound, if the contractions are sufficiently energetic, the labor may be left to unassisted nature; otherwise the cervix should be dilated with the fingers, and the infant withdrawn either by the hand or by the forceps. The procedure of Physick is a combination of Ritgen's and Baudelocque's, and consists in an incision immediately above the symphisis pubis, a separation of the peritoneum from the bladder, and a diversion of the uterine neck.

"We have described these operations, because it was proper so to do, but we do not believe that they offer any advantage or possess any superiority over those hitherto performed. In fact, they present difficulties and dangers from which the others are exempt.

"An incision through the body of the uterus, as is done in the ordinary operation, opens an easy mode of egress for the fœtus, and does not delay the operator or endanger the infant's life, or increase the mother's perils. Whereas, an incision made in a narrow compass much more limited and more difficult to reach, renders the operation extremely hazardous and makes the inconveniences inevitable. In opening the anterior wall of the uterine body, in dividing the great blood-vessels ramifying in its texture, there is undoubted danger of hemorrhage, but the energetic contractility of this portion of the uterus renders the danger a minimum. *On the contrary, by opening the lateral region of the uterine neck, or the vagina, which contains numerous large plexuses of blood-vessels, and under circumstances where this contractility is wanting, we cannot avoid an almost certain serious hemorrhage, besides the additional dangers of Cæsarean section performed in the ordinary way.*" Dubois then dismisses the subject and proceeds to point out various methods, indications, and cares for the performance of the older methods of gastro-hysterotomy.

From the condemnation of Ritgens, Baudelocque's and Physick's methods by contemporary obstetric surgeons, from their failure to make successful operations themselves, and from the fact that Prof. Thomas has succeeded in laparo-clytrotomy, I feel quite confident that the profession at large will accord him the merit due his skill, by hereafter designating it as "Thomas's operation."

Physical Signs of Madness.—The celebrated Legrand dû Saulle is contributing to the *Gazette des Hôpitaux* a series of papers on the physical indicia of that form of intellectual degeneration designated as *folie raisonnante* (mania without delirium). In a great number of cases, he observes, with the recent deposition of Dr. Macdonald, that the period of puberty is to be credited with the etiology of the phenomenon, while in others some anomaly of the genital organs or perversion of their function is the starting-point of the disease.

Sanitary Science in Russia.—A Russian Society of Public Health has been established at St. Petersburg, under the presidency of Dr. Zdekauer, who, at its inauguration on the tenth of February, paid the highest compliment to English sanitary science as far in advance of that of other European States.

Original Communications.

ON URINARY FISTULA IN THE ANTE-SCROTAL REGION.*

By ROBERT F. WEIR, M.D.,

SURGEON TO THE NEW YORK AND ROOSEVELT HOSPITALS.

The paper now presented to you is intended to call attention to a method, heretofore but little known, of treating fistulæ occurring in the ante-scrotal portion of the urethra. These fistulæ (excluding those of congenital origin), you are aware, can arise from peri-urethral abscesses; from direct violence, such as blows, incisions, and gunshot wounds; from sloughing produced by strings, etc., tightly tied around the penis; from the too long retention of a metallic catheter in the bladder; from the presence of a calculus in the urethra, etc.

In these latter instances the point of ulceration is generally close to the scrotum, where not only the weight of a catheter is mostly felt, but where also the narrowing of the bulbous portion of the urethra into the spongy part is most likely to impact a calculus, whole or broken. Further forwards, and near the meatus, fistulæ are met with, resulting from chancrous and chancroidal ulcerations; from paraphimosis; and sometimes from a peculiar follicular inflammation complicating a gonorrhœa. The fistulæ arising from the urinary abscesses following stricture, are more commonly found in the perineum, though cases occasionally present themselves with openings from the same cause, in the anterior part of the penis, as well as in more distant localities. In the treatment of penile or perineal fistulæ resulting from stricture, or complicated by the presence of such a contraction, the restoration of the calibre of the canal is evidently the first thing to be attended to. After this has been accomplished we may perhaps find to our chagrin, that the fine hair-like opening into the urethra will not close by any of the simpler methods of cure which may have succeeded in the treatment of fistulæ of much large size. The procedures that are rightly employed prior to any resort to operation are: first, to cut off all passage of urine through the fistula by teaching the patient to use a soft rubber catheter whenever he wishes to urinate, and to withdraw it after the bladder is emptied with the outer end tightly compressed or occluded, so that the urine left in the catheter will not escape into the urethra. This latter manœuvre is all-important, and the whole method, well carried out, often suffices to accomplish the healing of the opening. Second, if it should be found necessary to do more, the application to the edges of the opening of some irritant, such as the nitrate of silver, nitric acid, or tincture of cantharides, is to be tried. The latter remedy was highly recommended by Dieffenbach, who, prior to using it, dilated the small fistulous tract by inserting a piece of catgut in it for a few hours, in order that the irritating fluid should reach to the mucous membrane. Sometimes the red-hot needle, heated either in the flame of a spirit lamp or by the galvanic current, is of the most service.

Such remedies were tried in the following case, which came under my charge when I was connected with St. Luke's Hospital:

Case.—Edward F. B., æt. 22, was admitted to St. Luke's Hospital March 18, 1874, Dr. George A. Peters

* Read at the Meeting of the State Medical Society, Jan. 15, 1878.

being on duty, with the history that he had contracted gonorrhœa for the second time a few months previously, and that shortly after its appearance an abscess had formed along the course of the urethra anterior to the scrotum, which was opened by a small incision that had not yet healed. He had been two years before, in 1872, a patient in the hospital for the treatment of his first attack of gonorrhœa, and had then a urinary abscess and a subsequent fistula in perineo. This healed under proper treatment, but broke out again during the second attack of urethritis, so that he now, at the date of his second admission to the hospital, had two abnormal openings into his urethra—one antescrotal and one in the perineum. Examination showed that he had quite a tight subpubic stricture; and bearing in mind the results obtained by Ségalas in 1840, who dilated a perineal fistula to drain and cure an anterior one, and also by Ricord in 1841, who, as originally suggested by Dieffenbach, purposely made an opening in the perineal urethra to place at rest the anterior part—remembering this, I say, Dr. Peters wisely did external perineal urethrotomy, cutting through the perineal fistula. But as the wound of this operation gradually closed, some urine would escape anteriorly, and thus bathe and keep open the fistula there. When my term of service came, I found him with his two urethral openings, one from the abscess and one from the operation. The use of the rubber catheter to empty the bladder and keep the urethra free from urine, as before detailed, with the application of nitrate of silver, was resorted to with persistent care, and with as equally persistent want of success. A subsequent examination detected one or two slight so-called strictures of large calibre, and these were divided by Otis's urethrotome. The red-hot needle was also applied. All these means accomplished nothing. Dr. Sabine, who succeeded me in service, tried the vesical siphon as suggested by Grippat; viz., a soft catheter was left in the bladder with its external end continued by rubber tubing to a lower level than the bed. This had, however, to be abandoned on account of the cystitis that was excited by it. Another exploration then showed that the urethra near the yet open perineal wound was not up to a normal size, and this opening was consequently enlarged to divide this point, and also to allow of freer escape of urine. Dr. Little, another of the surgeons of the hospital, subsequently employed in the patient's behalf what is known as Dieffenbach's lace-suture, which is made by carrying a threaded needle around, and a little distance from, the freshened edges of the anterior fistula, in and out like the string of a purse—taking care, however, not to dip through the mucous membrane of the urethra, for that would have probably caused several minute fistulæ to form along the course of the thread. The thread was finally made to emerge at the same opening it entered, and its two ends were then tightly drawn together and tied. This had the effect to pucker up and snugly close the fistula. It is an operation which often succeeds, but here it failed. The most successful of the simpler operations for the cure of these fistulæ is the denudation of the edges over a wide extent with coaptation by sutures, preferably of silver. Czerny, in a recent paper on the subject, in the *Archiv f. klinische Chirurgie*, vol. xxi., p. 25, states that in twenty-three cases where this was done, seventeen cures were effected, and much prefers this method to the lace-suture. Unfortunately so few cases have been reported (Czerny could only collect less than sixty), and so many methods of operation have been proposed, that we are not at all able to enter statistically into this part of the subject. To return to our man:

The lace-suture having failed, as did also the freshenning and ordinary suture (just alluded to), he again came under my charge in December of the same year. The anterior opening then admitted a large probe freely, and was situated about two inches from the meatus, and the other opening in the perineum was nearly one and a half inches in length, and through which he micturated freely. A little time was occupied in testing the result of a device of mine to thoroughly exclude the passage of urine along the anterior urethra. This was done by passing a half-inch rubber tube, fastened at each end to a bandage around the waist, across the perineum, just behind the scrotum, somewhat snugly, but not painfully. By the moderate pressure of this the urethra was so closed as to entirely prevent any urine coming forwards. This expedient effected but little in healing the fistula, but it overcame to a marked degree in the patient a difficulty which is an important one in connection with plastic operations on the penis. I refer to the erections that so often pull upon and tear asunder the delicate flaps made in such operations. Usually they are combated with more or less success by the administration of camphor, lupulin, or by large doses of chloral or morphine, carried to a considerable degree of narcotism.

As we were now fairly driven to the consideration of a plastic operation for the cure of this obstinate fistula, this exclusion of the influence of erections was most fortunate. The next question to be settled was, what plan of operation should be chosen. The fault that is common to nearly all the simpler urethro-plastic operations from the time of Cooper and Earle, who in 1818 and 1819 were the first to perform such, to the present, whether the flaps be taken from the penis itself or from the prepuce, scrotum, thigh, or abdomen (Delpech), whether lateral or antero-posterior, glided or twisted, is, that the line of junction of the wound is either immediately over or so nearly adjacent to the fistula, that any leakage that may occur is likely to defeat the operation. Hence, other methods were to be entertained, and to appreciate their value a properly brief outline of them must be given (illustrated by diagrams).*

The endeavor in all is to carry the suture line away from the fistula, and also to form large surfaces for adhesion, in order that a partial primary success may be rendered a complete one by subsequent granulation and cicatrization.

Arlaud, in 1857, tried to accomplish this by simply superimposing one short flap over another longer one, the skin surface of which he scraped off, having first, as all operators do, scarified the edges of the fistula.

FIG. 1.

Rigaud, in 1852, took a square flap just below the fistula, turned it up and over like a hinge, so that its skin-surface rested against the fistula. This left the raw surface outwards and exposed, to be covered in turn by two small lateral flaps drawn or glided over it. Sédillot, in 1859, modifying one of Dieffenbach's methods, made two lateral flaps, dissecting from the outside up to near the fistula, turned them over and sutured them in such a way that the ends of the threads could be carried out through the meatus urinarius, and finally covered the raw exposed surfaces by a flap from the prepuce. (See figure 1.)

* Only a few are here reproduced.—W.

The best of these doubling or hinge-flap operations is, I think, that known as Szymanowski's (figure 2), and was the one I decided to use. Its conception is

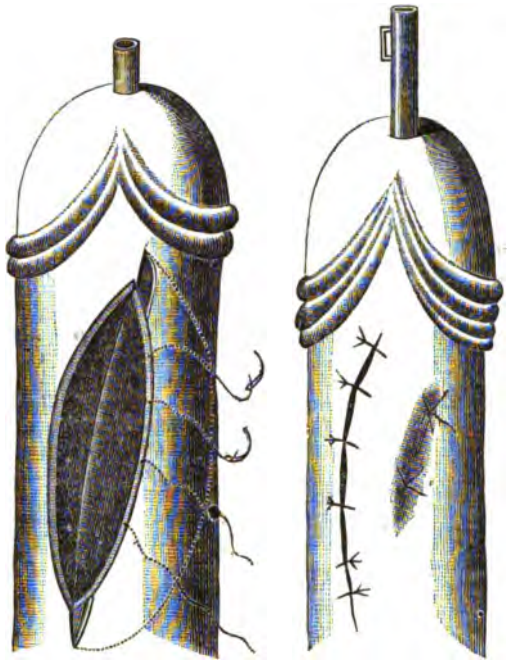

FIG. 2.

attributed to Langenbeck by Szymanowski, but the latter was the first to perform it.

The method consists in making a semicircular oval flap and dissecting it up to the edge of the fistula, after having first scraped off its epidermis, then turning it over and tucking it into a skin pocket formed by incising the skin along the other side of the fistula, and raising it up so as to make a receptacle for the first flap. Before the first flap is pocketed two or three points of suture are carried through its free edge and then through the skin at the deepest part of the pocket and finally tied externally. The loosened skin of the second incision is then drawn over, to cover up the gap caused by turning over the first flap, and secured by sutures. As copied from the hospital case-book, the details were as follows: "A straight incision was made coming close upon the left side of the fistula and extending nearly three-quarters of an inch above and below it. A second and crescentic incision, joining the first at its extremities and extending three-quarters of an inch to the right side of the fistula, was then made, and from each of these incisions the flaps were undermined to the left, the skin between the two incisions having first been denuded of its epidermis by scraping it with a scalpel. Two fine silk sutures then turned over and drew the right-hand edge of the scraped skin under the inner edge of the left-hand flap, and secured the same there by being passed through and tied on the skin outside. Thus the freshly denuded skin covered over the fistulous opening and also rested upon a raw surface beneath, and in its turn, its own raw surface met a similar one above. The outer lips of the two incisions were now brought together by fine silk sutures, and the wound was dressed with a compress of lint and a bandage."

The deep surfaces united satisfactorily, but granulation closed a considerable portion of the superficial area. Five weeks after the operation total closure of the fistula occurred, a delay of two weeks being caused by an extremely minute opening that threatened to be stubborn. No special treatment was given other than the continuance of the rubber tube. He left the hospital February 11, 1875, to return later for the closure of the perineal opening, which was done for him by Dr. T. T. Sabine, March 13th, by a modification of the above procedure, in making double flaps and dovetailing and pocketing them in a similar manner. Rectal puncture of the bladder was at the same time resorted to, to save the urethra from being flushed with urine, but the cannula inserted per rectum was not well borne, and was removed at the end of two days. The perineal fistula closed partially by first intention, and finally by granulation at the end of four weeks, the patient thus having been under treatment for his urinary fistulæ over a year. Czerny, in the article quoted, gives seven and a half months as the average duration of treatment in his numerous cases.

Since then this method of operation has been three times used with success: once by Dr. S. B. Ward, of Albany, and twice by Dr. McBurney, one of the surgeons of St. Luke's Hospital. To secure a more thorough denudation of the skin than was obtained by scraping it, Dr. McBurney in one instance blistered the skin a day or so prior to the operation; but not liking the working of this, in his second case he shaved off a thin slice of tissue with a sharp knife, with a happy result.

I have intentionally deferred until now calling attention to sundry other methods of operating for these fistulæ, though they have been recommended by Erichsen, Thompson, and others. For instance, Dieffenbach (figure 3) proposed to close the edge of the freshened fistula after having detached it and the skin surrounding it from the subjacent tissues by means of two lateral incisions, which by this dissection communicated freely with each other. His idea was by this to allow the urine to escape easily through the

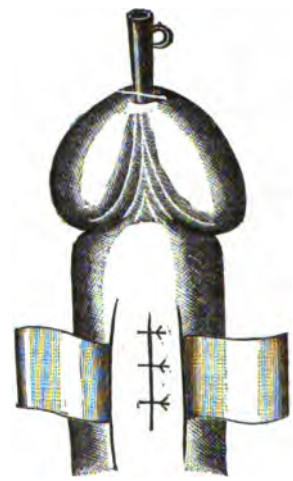

FIG. 3.

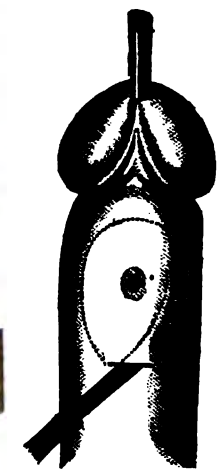

FIG. 4.

side cuts, while the sutured skin portion of the fistula closed, after which the recently made side openings were expected to rapidly close by granulation. Nélaton, in 1852, modified this "bridging process," as it is called, by making a small incision above or below (figure 4), and performing the dissection as much as possible subcutaneously.

I confess these methods do not strike me favorably, yet it must be admitted that no fixed rule can be set forth, as every case requires special study as to the

best manner to utilize remaining or adjoining tissues. Advantage may be derived in some instances by Reybard's (1856) or Delorne's (1874) (figure 5) method. These surgeons make large lateral flaps, bases outwards, whose raw surfaces are apposed over the fistula and held against each other not only by sutures at their edges, but also up to their bases, Reybard using the quilled suture, and Delorne interrupted ones, arranged like the tufts of a mattress—in fact, he calls them the "mattress suture." Le Gros Clark, of London, makes use of flaps similarly held together. By the large surfaces thus brought in contact a greater chance of union is obtained.

FIG. 5.

While the statement incidentally made a short time since, that there was frequently more difficulty in closing a small fistula than a larger one, is true, yet there is to this a limit. For Pemberton, an English surgeon of eminence, has stated that there is no satisfactory record of a fistula being closed where more than one inch of the *entire* circumference of the urethra has been destroyed. Still, the recent successful urethro-plastic operations of Duplay (*Archives Générales de Médecine*, June, 1874), for the reparation of congenital absence of the urethra for several inches, leads me to hope that this dictum may be reversed.

Though particulars are wanting as to whether the urethra was totally destroyed in the space given, nevertheless Ricord's (1849) formation of a covering to a fistula of 1¾ inches in extent moreover affords us an encouragement to the hope just stated. Also Earle's case, with a restoration of one inch, and Weinlechner's, of 1½ inches, are to be kept in remembrance before pronouncing as incurable a patient afflicted with a large fistulous opening into his urethral canal.

A SUBSTITUTE FOR COD-LIVER OIL IN SKIN DISEASES,

ORIGINATING IN, OR ATTENDED BY MARASMUS.*

BY SAMUEL SHERWELL, M.D.,

MEMBER OF N. Y. AND AMERICAN DERMATOLOGICAL SOCIETIES, ETC.

IT is well known that the "cake" which remains after the expression of linseed oil, is largely used by farmers and horse fanciers to fatten their cattle and horses, and to improve the appearance of their coats. This cake contains the principal nutrient albuminoid elements of the ground flaxseed, together with a varying proportion of the oil.

Having had of late a number of cases of cutaneous disease, in which marasmus from defective assimilation of the hydrocarbons was a prominent feature, and in which cod-liver oil was not well borne, it occurred to the writer that the oil of the flaxseed might prove an efficient substitute.

In its ordinary commercial condition, linseed oil is not a very palatable article of diet, but as met with in its natural combination in the fresh seed, is by no means unpleasant to the taste. Believing that the same effects might be expected in the human subject as are known to follow the use of linseed in the lower animals, I have made it a portion of the diet of a number of patients who were unable to take cod-liver oil in the ordinary manner.

The better qualities of flaxseed contain about thirty per cent. of oil, so that by the use of the unpressed seed, a very considerable quantity of oleaginous matter can be incorporated in the daily diet. The seed may be used in several ways: First, the freshly ground seed may be taken in the mouth, and thoroughly masticated before swallowing; second, it may be given suspended in milk; and third, the unbroken seed itself may be used. This last method is the one that I prefer. To carry this out, I commonly direct the patient to carry in his pocket or other receptacle a quantity of the seed, and from time to time to take a little of it in his mouth, and to chew it thoroughly before swallowing, in order to insure complete insalivation. In this way some patients will consume several ounces a day, the amount, of course, varying greatly in different cases.

Thus far this use of the seed has not been attended with any disagreeable accompaniments. The stools are rendered easy and natural, without any tendency to diarrhœa, or other unpleasant complications.

The cases of pemphigus foliaceus, pityriasis rubra, lichen planus, and lichen ruber, which were some time since exhibited at the Society, have been taking the seed in the manner indicated with very decided benefit. It will be remembered that they were all in a more or less marasmic condition when first shown. During the use of the seed, however, they have greatly improved in general nutrition and in the condition of their skin.

The ordinary seed of the drug-stores is not the best that can be obtained for this purpose. A much better article being that known as Calcutta seed. Care should be taken that it is free from admixture with other seeds, chaff, dirt, etc.

As a substitute, in many cases, for cod-liver oil, we believe that it will be found, on further trial, to fully justify our earlier expectations concerning it.

In view of the fact that there is so much sophisticated cod-oil in the market, and that an inferior quality can be readily disguised under the form of an "emulsion," a substitute that cannot be readily adulterated would seem to merit the consideration of the profession, and more especially that of dermatologists, in view of what I must consider its specific determination.

* Synopsis of paper read before the New York Dermatological Society, Jan. 29, 1878.

A CASE OF RECOVERY IN A CHILD, AFTER A POISONOUS DOSE OF CARBOLIC ACID.

BY S. HENRY DESSAU, M.D.,

NEW YORK.

THE following case furnishes a remarkable instance of recovery in a child from a poisonous dose of carbolic acid. I was called in haste, Feb. 12, 1878, to see a boy 2½ years old, who had ten minutes before helped himself to about a teaspoonful of pure carbolic acid, equal in strength to Calvert's No. 2 preparation. The mother stated that immediately after the child had swallowed the acid he began to run around the room crying, when she took him in her arms, and he instantly became unconscious, turning livid in the face

his eyes staring, breathing slowly and noisily, and foaming at the mouth and nose. Sweet-oil was administered as soon as possible, and when I arrived he was still unconscious, breathing slowly and noisily, with a moan. The larynx was full of râles. His face was pale, cheeks livid, pupils dilated and not responding to light, and there were slight twitchings of the muscles of the extremities. The capillary circulation was very slow. There was a streak of excoriation upon the chin, where some of the acid had run. I gave more sweet-oil, and excited vomiting to a limited degree by irritating the fauces with a feather. Quantities of tenacious, partially coagulated mucus were expelled after each attempt at vomiting. The white of an egg was afterwards given. Consciousness was restored in a half-hour, and I left with orders to give frequently small quantities of milk and lime-water. I saw the boy again four hours later, when I was informed that about a half-hour after I left he twice vomited a large quantity of food that he had taken four hours before taking the acid. Shortly afterwards he again vomited a quantity of mucus mixed with arterial blood. I found him quiet and cheerful. I gave him small doses of subnitrate of bismuth and prepared chalk, to be taken every three hours. The next day I learned that he had not vomited since my last visit. He had been very restless and thirsty through the night. He had taken about a pint of milk and lime-water. His temperature in the rectum was 100° F. He occasionally coughed croupy. The throat was examined and the uvula found whitened and shrivelled. He had passed in the morning about a pint of clear urine, of a dark olive-green color, without odor.

Feb. 14th.—He was troubled in the night with a croupy cough, which has almost disappeared. Temp. 99 4-5° F. Bowels have not been moved since the day he took the acid. Tongue is coated, and he refuses food. Ordered him to have an enema.
